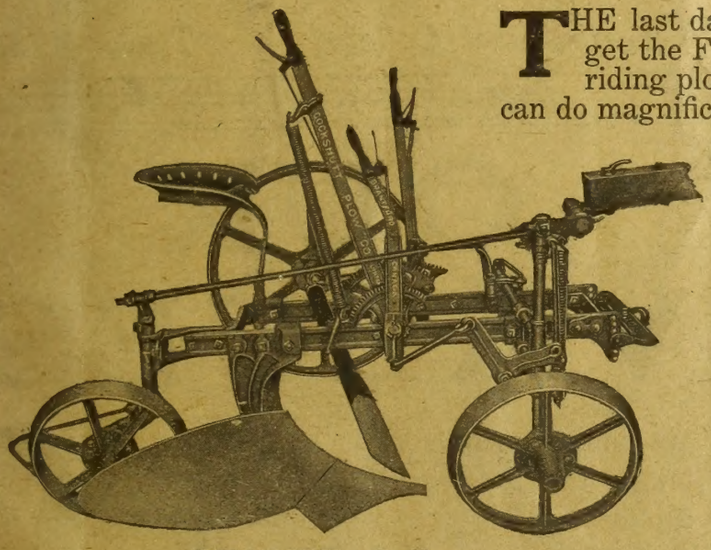
Rush Your Plowing---Don't Delay!!

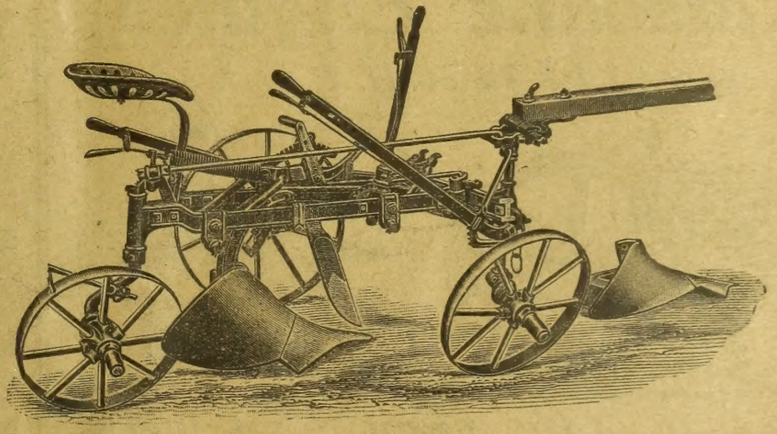
THE last days of plowing are on you. You know how it pays to get the Fall Plowing done. Here are two favorite light-draft riding plows that have made great successes in Ontario. You can do magnificent work with these easy-handled Cockshutt designs. We can make prompt delivery. Finish your plowing before frost and snow come.



BEAVER Sulky

This is one of the best plows for general farming. It does work equal to that of a walking plow. The "Beaver" will plow to seven inches deep, and keeps at even depth in uneven land, owing to the wheel arrangement. Levers are easily reached from the seat, and have coil helper springs. The high beam prevents choking. The dust-proof wheels, furrow-straightener, short-turn, and other features of design are equalled by the quality of material. Fitted with loam or clay bottoms, and with choice of knife or rolling colters.

FOOTLIFT Sulky



has strong steel wheels with dust-proof bearings that need oiling only once a season. The furrow-straightener device makes a straight furrow easy to plow. The levers are in easy reach. Driver's hands need never be off the reins. Choice of Judy bottom for clay or No. 21 bottom for loam, with choice of knife, rolling colter or jointer, as desired. Also steel shares, if desired. The mold-boards are unbreakable soft-center hard-surface steel.

Our Agents have a full line for sale

See our Agent regarding any farm implement you need, or We are always ready to give information and help in regard to any farm implement. A post card will do. **Write Us**

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

M. CUMMING, B. A., B. S. A., Principal Agricultural College, Truro, N. S.

HALIFAX, N. S.

BUILD YOUR BARN LIKE THIS!

YOUR COWS WILL PRODUCE MORE IN A SANITARY STABLE, AND YOUR WORK WILL BE CUT SQUARELY IN TWO

STEEL STALLS ARE SANITARY

Steel Stalls do not soak up the manure. When used with a cement floor you have a perfectly sanitary stable. The main cause of the spread of tuberculosis in cattle is through urine and manure. No danger with Steel Stalls.

DON'T OBSTRUCT THE SUNLIGHT

Sunlight is the best disinfectant in the world. With steel stalls there are no dark corners. They allow a free movement of air and light. It is easy to keep a stable equipped with BT Steel Stalls clean.

COW COMFORT MEANS INCREASED PRODUCTION

A cow tied in a BT Steel Stall and Stanchion has the maximum freedom consistent with keeping her tied up in her stall. She can card herself on almost any part of the body. Tied centrally in her stall, she is free to lie down on either side. She can freely get up or down, but at the same time she is prevented from moving backward and forward in her stall so that she can be lined up on the cattle stand and all droppings go into the gutter, not on the cattle stand. That means clean cows.

You can build a Modern Sanitary Dairy Barn just like this at a very low cost, and we have figures to prove that the Steel Equipment will pay for itself in a year's use. And the beauty of it is you can do the whole thing yourself if you use BT Steel Stalls. Write us to-day. Our Free Barn Plans will help you.

STEEL STALLS ARE DURABLE

When you put in BT Steel Stalls with a cement floor you have a permanent job—no posts rolling off—no partitions breaking—no repairs to make. Isn't that worth something?

FIRE RISK IS LESSENED

A stable equipped with steel stalls and a cement floor is not nearly as liable to take fire as a wood stable. In fact the lower part of the barn would be almost fireproof. Should fire occur, however, cows tied in BT Stanchions can be let out in half the time required with chain ties. AND THE BEST OF IT IS

You Can Build or Remodel Your Stable Yourself If You Use BT Steel Stalls.

In an hour you can set up twenty BT Steel Stalls, ready to be cemented in, and as soon as the cement is dry, [illegible] is ready for the cattle. No expensive lumber to buy, and get sized and dressed. No high priced carpenters to hire and work for [illegible] they put in your stable. You can [illegible] barn if you use BT Steel Stalls. Our book on Stable Construction [illegible] how to lay cement floors, and [illegible] Stalls quickly and properly. We go further than supplying equipment. We will [illegible] our barn by sending [illegible] set of plans, [illegible] specifications, [illegible] so that you can [illegible] to deal with your stable yourself.

Get Our Free Stall Book

It shows how BT Steel Stalls lessen Abortion, do away with the principal cause of Big Knees, Ruined Udders and many other injures that cows are liable to. You will see how individual mangers save feed—prevents overfeeding and underfeeding. You will also learn how the exclusive features on BT Steel Stalls mean dollars and cents to you by giving greater comfort and protection to your cows. This book costs you nothing. Write us for it.

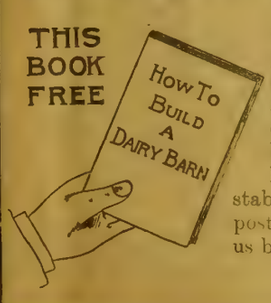
MAIL THE COUPON NOW

IT WILL PAY YOU WELL TO WRITE FOR OUR GREAT BARN BUILDING OFFER TODAY. MAIL THE COUPON NOW BEFORE YOU FORGET.

BEATTY BROS., 228 Hill Street, Fergus, Ont.

FREE Barn Plan Service

THIS BOOK FREE



Get our book on Stable Construction. It shows you how to [illegible] from start to finish. It gives the best system of [illegible] framing—[illegible] money over the ordinary metods of constructions. This book may save you hundreds of dollars in building and equipping your stable. Yet it is free. A letter or post card or the coupon mailed to us brings it by return mail.

If you are going to build or remodel [illegible] barn write us today. A barn is a permanent investment—do not undertake building it without getting the latest information. Send us a rough sketch of the Floor plans of the barn, and get our expert advice, Remember. If you put in any BT Equipment we will plan your barn for you FREE.

DE LAVAL CREAM SEPARATORS

"Scrub" Cream Separators as Unprofitable as "Scrub" Cows

173 William Street, MONTREAL, CAN.

This is the good advice one of the big and long experienced American cream buying concerns gives to its farm separator patrons, being taken from a letter to one of them:

"We believe the DE LAVAL is the best separator made. We feel that anyone wishing to purchase a separator makes a great mistake unless he purchases the best machine on the market. No one can make a success of dairying by continuing to use scrub cows. Neither can he make a success of dairying by using scrub separators."

There couldn't well be a more simple, comprehensive and forceful statement of the whole cream separator proposition than this. It's just plain common sense.

DE LAVAL DAIRY SUPPLY CO., Limited.

14 Princess Street, WINNIPEG, CAN.

Makes Pigs "Stay Put"

The hog never grunted that could get the better of a Maritime Wire Fence. For this springy, taut, vastly strong fence, made of extra-quality hard-drawn coil-spring STEEL wire, has its verticals and cross wires locked together with the death-grip lock that CAN'T loosen or slip under any strain whatever. Your cattle and swine will stay where you put them if you fence with this BETTER fence. Once properly erected, Maritime Wire Fence stays taut, straight, sagless and sightly. It is good for twice the fence service ordinary fence can give. Yet it costs no more

MARITIME WIRE FENCE

Save Yourself Worry and Money

Bid fence worries good-bye, and save money, too, by getting the right fence in the first place. You won't have to be patching your fences every spring if you fence with Maritime Wire Fence. It STAYS put too. Made and sold on honor. Send for the Fence Book and Price Lists. Do this now.

It would pay you to be our agent. Send for new 1911 offer. 13

The Prince Edward Island Provincial Exhibition

Evidences of Improved Live Stock and Grand Display of Agricultural Products

THE twenty-third Annual Exhibition at Charlottetown was ushered in on Sept. 24th by the finest spell of weather this season has produced, and which fortunately for the Directors and Exhibitors lasted during the entire show.

The President of the Association, Justice Fitzgerald, occupied the chair at the opening by His Honor Governor Rogers.

The addresses of all the speakers were alive with enthusiasm, and the progress made in the quality and the quantity of exhibits year by year, as well as the better farming methods employed were touched upon by more than one speaker.

Hon. M. McKinnon, Commissioner of Agriculture, referred to the weather conditions of this season contrasting them with those of 1911, and remarked that the farmers who were progressive were able, to a great extent, to meet these different conditions successfuliy.

Mayor Lyons, U.S. Consul Frost, and Rev. Dr. Gauthier all spoke on the unlimited possibilities of intensive farming, as one of the best means of inducing the young men of the Province to remain in their own native land.

A number of the speakers suggested that many farmers with 100 acres or more of land could well afford to give their sons 20 acres without sacrificing a great deal; and when the young men were settled down and married it would counteract the desire to leave the country, and incidentally solve the labour question on the farms.

Dr. Gauthier, President of the Central Farmers Institute, said that patriotism like charity begins at home.

He deplored the senselessness of letting our patriotism get tainted with politics. The man who builds up his farm and his home was the best defender of his country, and it was foolishness to raise the cry of annexation, and never raise a finger to prevent the young men and women being absorbed by another nation.

Dr. Andrew McPhail, D. Hughes Charles, and W. F. Stephen of the Ayrshire Breeders Association spoke briefly and optimistically of the present and future prospects of the Garden of the Gulf, that led the other provinces not only in wealth per capita, but yields a greater return per acre than any of them.

BARON KELVIN

Champion Clydesdale Stallion at Charlottetown 1912 Exhibition.

Baron Kelvin was imported from Scotland in 1911 by Graham and Renfrew Co. of Bedford Park, Ontario, who sold him to John Richards, Bideford, P. E. I. Baron Kelvin is considered to be one of the best Clydesdales in America today and judging by his success in the prize ring and in breeding ranks the claim is justifiable. He was shown at the Toronto Industrial Exhibition in 1911 where he won first prize in his class and championship over all ages. Later he competed in the state of New York, against all breeds and again won the championship. At the Winter Fair, Ottawa, last January, he met and defeated the very best stallions in Canada. He sold at perhaps the highest price ever paid for a stallion in Canada, which shows that the breeders of P. E. Island are out for the right kind of stuff.

HORSES

Draught Horses were judged by John Bright of Myrtle Station, Ont.; and the Light Horses by D. Hughes Charles, of Montreal, both awarding the prizes without fear or favor.

The Heavy Draught Horses showed a steady improvement on former years; but despite a number of individuals in the Carriage class, they showed a decided falling off both in size and quality, and in some sections the judge was unable to award more than a second prize.

The aged Clyde class brought out the Champion Toronto winner of 1911, "Baron Kelvin" who won honors at Edinburgh and other places before his importation.

Another Scotch horse with great breeding was "Keppick Prince" son of "Scotland Yet," the noted Cawdor cup winner at Glasgow this year. This horse took first honors over two other beautiful types of Clydes "Labori Again," and "Caspar" owned by Messrs Lea & Clarke, and J. Morris respectively.

Some surprise was shown when "Prairie Jack" first prize winner in the roadster class 1911, took no award this year, and owing to lack of competition "Darkwood" owned by McAfee was handed out the blue ribbon.

During the Exhibition the Island Horse breeders decided to hold a Spring show at Charlottetown next year, and from the quality of the stock, and the grand entries made there this fall should be an unqualified success.

CATTLE

T. P. Cass had nearly all his own way in Shorthorns winning first in aged herd headed by his champion bull "Somerset" that also took first prize in the two-year-old class. The breeder's young herd went to a promising lot owned by Frances Saunders. Lea & Clarke's, Holsteins; and Roper Bros., Guernseys, that won so much distinction on the mainland attracted a lot of attention, the stalls being prettily decorated with their numerous and various prizewinnings.

The judge, Mr. W. F. Stephen conducted the milk test in a higly competitive class of milking beauties, amongst which was a former world's record cow.

As usual the judging competition for farmers sons attracted a lot of attention; by the keenness and intelligence shown by the boys interested in one of the most educative features of the show.

SHEEP.

The sheep classes were well filled, the prize winners in the main being those exhibiting with such success at St. John and Halifax.

Judge, Jno. Millar awarded the prizes in this class.

A. H. Boswall claimed all the red ribbons in Oxford Downs; H. H. Weatherbie all the seconds and thirds.

With Cotswolds, John Tweedy captured all the first and two seconds, Harry Tweedy getting the balance.

All the first prizes in Leicesters were taken by Albert Boswall senior. S. L. Boswall carrying off all seconds and thirds but four sections which went to S. C. Lane.

Albert Boswall gathered in all the red tickets in the Suffolk class, the blues and whites being evenly divided with Almon Boswall.

Cephas Nunn cleared up every prize in the Hampshire Down class except that for aged ram which fell to Oliver Nunn.

Lincoln red ribbons were carried off by Albert Boswall, who divided the second and third place winnings evenly with Ernest Lund.

SWINE.

The Island may well be proud of its pig breeders, and pork producers. The judge, Mr. J. B. Spencer, remarked on the splendid quality in all classes.

The 1911 champion bacon sow at Amherst was here, with her dam and litter, that was champion in 1910, shown by Wm. J. Gibson, who won all prizes in the Tamworth class but one section.

Peter Brodie's Berkshires that have done so much to improve the breed in the Province was to the front with a lot of quality.

The Chester Whites and Yorks were a worthy lot with the prizes very evenly divided.

POULTRY.

White Leghorns and Barred Plymouth Rocks were very much in evidence this year, and the pens contained some fine specimens.

There was a slight falling off in some other sections compared with former years, but the quality was very good expecially in geese.

Seth Jones, of Sussex, N. B., was again the judge.

AGRICULTURAL PRODUCTS.

Many sections in this class showed the result of the off season of 1912. Apples lacked color, and the straw in many of the sheaves revealed the state of the weather during harvest time. However, the turnips, mangels and potatoes were all up to the usual high standard found at Charlottetown. Fewer samples of timothy seed were in evidence than usual, but this product of the farm is still increasing; and it will only be a matter of a year or two when it will be exported in quantities. Garden produce and grains were very attractively displayed and were judged by S. J. Moore of Truro.

Prize Winners at the Prince Edward Island Exhibition.

Horses

THOROUGHBREDS.

Mare, 3 yrs.—1, A. Horne; 2, John Steward; 3, Robt. E. Longworth.

CARRIAGE HORSES.

Stallion, 4 yrs.—1, John Magee.
Stallion, 3 yrs.—1, Byrne Bros.
Stallion, 2 yrs.—1, Henry Gurney; 2, Duncan Robertson.
Filly, 3 yrs.—1, Albert Boswall; 2, Seymour Wood.
Filly, 2 yrs.—1, John Gillis; 2, Geo. L. Boswall; 3, Ira. D. Carr.
Filly, 1 yr.—1, Almon Boswall; 2, Lee Essory; 3, Guy Rodd.
Foal of 1912.—1, Almon Boswall; 2, Ray Horne; 3, John Steward.
Mare with foal.—1, John Cummings; 2, Wm. McEwen; 3, Almon Boswall.
Carriage mare or gelding.—1, W. S. McKie; 2, John Gillis; 3, G. A. Sharpe.
Carriage mare or gelding.—1, Henry Wood; 2, Chas. Chandler; 3, Wm. Bateman.
Champion mare.—1, Albert Boswall Sr.

SADDLE HORSES.

Gent's saddle horses.—3, Wm. Davies.
Ladies saddle horses.—1, Miss Lottie Boswall; 2, Ray Horne.
Brood mare and foal.—2, D. H. White; 3, H. H. Horne.

CLYDESDALES AND SHIRE HORSES.

Stallion, 4 yrs.—1, John Richards; 2, Geo. Dorkendorff.
Stallion, 3 yrs.—1, W. W. Crosby; 2, Lea & Clark; 3, J. P. Morris.
Stallion 2 yrs.—1, P. C. Brown; 2, John Tweedy; 3, Dr. Lockie.
Stallion, 1 yr.—1, John Richards; 2, Wm. A. Godfrey.
Filly, 3 yrs.—1, Edgar Heartz; 2, Alf. Steward; 3, Helen Crosby.
Filly, 2 yrs.—1, W. W. Crosby; 2, John P. Morris.
Filly, 1 yr.—1, W. W. Crosby; 2, John Morris.
Foal of 1912.—1, Wm. McRae; 2, H. Crosby; 3, Dan Taylor.
Mare and foal.—1, Wm. McRae.
Champion stallion.—1, John Richards.
Champion mare.—1, Wm. McRae.

DRAFT HORSES.

Filly, 3 yrs.—1, Lony Bros.
Filly, 2 yrs.—1, Lee Essory.
Filly, 1 yr.—1, A. A. McBeath.
Foal of 1912.—1, J. Stockman; 2, Benj. Rodd; 3, O. Saunders.
Mare and foal.—1, B. Rodd; 2, O. Saunders; 3, J. Stockman.
Pair of draft horses.—1, D. McMillan; 2, Roper Bros.
Draft mare or gelding.—1, C. Byranton; 2, Lony Bros.; 3, J. G. Hughes.

GENERAL PURPOSE.

Mare, 3 yrs.—1, Colin McDonald; 2, S. Prowse; 3, J. B. Roper.
Mare, 2 yrs.—1, J. W. Rodd; 2, R. Lilliphant; 3, R. L. Days.
Brood mare and foal.—1, Geo. Stewart; 2, Lee Sssory; 3, Hood & Sons.
Matched team, geldings or mares. 1, R. Lilliphant.

WALKING HORSES.

Mare or gelding, draft.—1, H. Crosby; 2, R. B. McMillan; 3, H. H. Horne.
Bank of Commerce Medal—John Richards.

SHORTHORNS.

Bull, 2 yrs.—1, Thos. P. Cass.
Bull, 1 yr.—1, A. A. McBeath; 2, W. Stead; 3, S. C. Lane.
Bull calf under 1 yr.—1, A. Boswall; 2, A. A. McBeath.
Bull and calf under 6 months.—1, Thos. P. Cass.
Cow in milk or calf 3 yrs.—1, H. F. Sanderson; 2, T. P. Cass; 3, D. Collings.
Cow in milk or calf 2 yrs.—1, T. P. Cass; 2 and 3, H. F. Sanderson.
Heifer, 1 yr.—1, H. F. Sanderson; 2, T. P. Cass; 3, D. Collings.
Heifer and calf under 1 yr.—1, T. P. Cass; 2, H. F. Sanderson.
Heifer calf under 6 months.—1, T. P. Cass; 2, H. F. Sanderson.
Champion bull.—1, T. P. Cass.
Champion female.—1, T. P. Cass.
Breeders' young herd.—1, H. F. Sanderson.
Aged herd.—1, T. P. Cass.

AYRSHIRES.

Bull, 3 yrs.—1, Easton Bros.; 2, C. Lund.
Bull, 1 yr.—1, Easton Bros.; 2, A. McRae & Sons.
Bull calf under 1 yr.—1, A. McRa & Sons; 2, Easton Bros.
Bull calf under 6 months.—1, C. H Robertson; 2, Easton Bros.
Cow in milk, 3 yrs.—1, A. McRae & Sons; 2 and 3, Easton Bros.
Cow in milk, 2 yrs.—1 and 3, Easton Bros.; 2, C. H. Robertson.
Heifer, 1 yr.—1, A. McRae; 2 and 3 Easton Bros.
Heifer calf under 1 yr.—1, E. A. McRae; 2, Easton Bros.
Heifer calf under 6 months.—1, Easton Bros.; 2, W. A. Millar.
Breeders young herd.—1, Easto Bros.
Aged herd.—1, Easton Bros.
Champion bull.—1, Easton Bros.
Champion female.—1, A. McRae & Sons.
Canadian Ayrshire Breeder' Ass'n SPECIALS.
4 animals either sex.—1, Easton
2 animals either sex.—1, A. McRae & Son.

JERSEYS.

Bull, 3 yrs.—1, Wm. Clark & Son.
Bull, 2 yrs.—1, Wm. Clark & Son
Bull, 1 yr.—1, S. Holyroid; 2, S. Warren.
Bull calf under 1 yr.—1, H. Horne.
Cow in milk, 3 yrs.—1 and 3, Wm. Clarke; 2, H. Horne.
Cow in milk, 2 yrs.—1 and 3, Wm. Clarke; 2, H. Horne.
Heifer, 1 yr.—1 and 2, Wm. Clarke; 3, S. Warren.
Heifer calf.—1 and 2, Wm. Clarke; 3, F. A. Calvin.
Aged herd Wm. Clarke.
Breeders young herd.—Wm. Clarke.
Champion Bull.—1, Wm. Clarke.
Champion female.—1, Wm. Clark.

GUERNSEYS.

All prizes were won by Rope Bros.

HOLSTEIN-FREISIANS

Bull, 3 yrs.—1, Lea & Clarke; 2, John Tweedy; 3, A. McDonald.
Bull, 1 yr.—1, John Tweedy; 2, P. Robertson.
Bull calf under 1 yr.—1, A. H. Boswall.
Bull calf under 6 months.—1, Lea & Clarke; 2, W. J. Gibson.
Cow in milk or calf 3 yrs.—1, 2 and 3, Lea & Clarke.
Cow in milk or calf 2 yrs.—1 and 3, Lea & Clarke; 2, E. Heartz.
Heifer, 1 yr.—1 and 2, Lea & Clarke; 3, E. Heartz.
Heifer under 1 yr.—1, Lea & Clarke; 2, P. Robertson.
Heifer calf under 6 months.—1, P. Robertson; 2, Lea & Clarke.
Aged herd.—1, Lea & Clarke.
Breeders young her.—1, Lea & Clarke.

SHORTHORN, HEREFORD, POLLED ANGUS OR GALLOWAY GRADES.

Cow, 4 yrs.—1, Belle View Farm; 2, R. Longworth; 3, S. C. Lane.
Cow in milk or calf 3 yrs.—1, V. McMillan; 2, R. L. Days.
Heifer, 2 yrs.—1, R. Longworth; 2, T. P. Cass; 3, A. H. Boswall.
Heifer, 1 yr.—1, A. Boswall Sr; 2, R. Longworth; 3, H. Crosby.
Heifer calf under 1 yr.—1, J. Praught; 2, A. H. Boswall.
Heifer calf under 6 months.—1, Al. Boswall; 2, T. P. Cass.

AYRSHIRE GRADES.

Cow, 4 yrs.—1, C. H. Robertson; 2, R. Stewart; 3, Wood & Son.
Cow in milk or calf 3 yrs.—1, A. McRae.
Heifer, 2 yrs.—1 and 3, A. McRae; 2, Easton Bros.
Heifer, 1 yr.—1 and 3, A. McRae; 2, H. McRae.
Heifer calf under 1 yr.—1, C. H. Robertson; 2, H. McRae.
Heifer calf under 6 months.—1, C. H. Robertson; 2, R. Stewart.

JERSEY OR GUERNSEY GRADES.

Cow, 4 yrs.—1, Wm. Clarke & Son; 2 and 3, Roper Bros.
Cow in milk or calf 3 yrs.—1, Roper Bros.; 2, Easton Bros.; 3, R. Stewart.
Heifer, 2 yrs.—1, Roper Bros.; 2, R. Stewart; 3, W. T. Stead.
Heifer, 1 yr.—1, A. McRae & Son; 2, F. A. Calvin; 3, J. Pierce.
Heifer calf under 1 yr.—1, John Pierce; 2, Roper Bros.
Heifer calf under 6 months.—1, Roper Bros.; 2, W. Stead.

Stadacona Lady Mary Stuart, Orange Lily 2nd, Flo's Jean, Morton Mains Lady Nelly and Grange Kelly

First Prize aged Ayrshire herd at the St. John Exhibition. Owned and exhibited by McIntyre Bros., Sussex, N. B.

The Cape Breton Island Exhibition.

After a lapse of twenty-six years the Cape Breton County Farmers' Association organized an exhibition at North Sydney in the fall of 1909.The results accomplished surpassed the most sanguine expectations of the promotors. In 1910 the exhibition was held at Sydney, and in 1911 North Sydney was again the scene of action, the results being very gratifying to the exhibitors, visitors and the management. Although larger premiums were paid year by year, the entries were more numerous and of higher quality and a steady increase in general interest and attendance left handsome balances in the treasurery.

This year an Exhibition Commission has been organized at Sydney, the eastern gateway of Canada, and with the characteristic enthusiasm of true Sydneyites they have gone forward to a successful culminatian with an institution that is destined to bring into prominence the agricultural resources of Cape Breton, the long wharf of the American Continent.

In other years the Cape Breton exhibition was open only to Cape Breton County exhibitors; this year and from hence forth the fair was and will be open to the four Cape Breton counties—Cape Breton, Inverness, Richmond and Victoria.

The association has purchased permanent exhibition grounds and have erected buildings which are fitting tributes to the energy of the management.

By working hand in hand with the Cape Breton County Farmers' Association the Sydney Exhibition Commission has the good will and support of the Cape Breton farmers.

S. P. Chaloner, the untiring Secretary of the Exhibition Commission and R. M. Jackson, Secretary of the County Farmers' Association were at the helm of affairs.. The McQueens, the Munns, the Johnstons, the Jacksons, the Moffats, D. R. Nicholson and various other members of the County Farmers' Association worked with a will and it was a pleasure to note the smoothness with which the various details in the respective departments over which they held sway were conducted.

The weather throughout the entire fair period, September 24th. to 28th. inclusive was, to say the least, delightful and throngs of visitors from city, town and farm flocked to the grounds until the turnstiles at the close of the fair registered an attendance of upwards of 27,000.

The reader, who is not acquainted with Cape Breton conditions will naturally ask: From whence came such a grand attendance? The reply is that from a town of 3,200 inhabitants in 1899, Sydney has risen to an estimated population of 25,000 in 1912 while within a radius of twelve miles no fewer than 75,000 souls inhabit the smaller towns of North Sydney, Sydney mines, Florence, Reserve, Dominion, Glace Bay and the other collieries operated by the Dominion Coal Company, to say nothing of a large population on the fertile areas of farm lands and the other towns that are scattered broadcast all over the four counties.

The person who inquires re the agricultural possibilities and the person who is inclined to think that an abundance of minerals embosomed in mountains high and valleys low constitute Cape Breton's principal resources could get their answer by sauntering on a tour of observation through the various Sydney exhibition buildings.

Encouraged by the best cash market for all agricultural products in eastern Canada the Cape Breton farmers are making rapid strides of progress on their naturally fertile lands, and a $7500 exhibition prize list is bound to lengthen their strides.

The prize list was so arranged that county sweepstakes prizes were offered in the various classes in addition to substantial prizes in the open inter county competitions.

Horses were judged by Mr. E. Watson, Hudson Heights, Que. who was well pleased with the quality of the exhibits.

Draft Horses.—In the draft horse class, H. A. Moffat's Clydesdale stallion, Baron Majestic, was the chief attraction. Baron Majestic is proving a boon to the Cape Breton horse industry. He is a well coupled, trappy mover and both he and his foals in the draft and general purpose classes were much admired. He had no competition in his class, he could have stood a lot of it. Baron Majestic met steel at the Maritime norse show in 1911 and came out of the fray with the championship honors, with a strong class in the ring.

D. R. Nicholson's Clyde mare with her foal by Baron Majestic had no competition in their respective classes but in the'Moffat special for best foal, sired by Baron Majestic, foals out of general purpose mares to the number of nine or ten came forward but the Nicholson foal carried off the "ten spot."

J. S. McLennan had the best draft mare, any age. R. B. McLean showed the only matched pair and a Nicholson horse was sandwiched in between horses shown by J. S. McLennan and Jas. Dunlop in the section for draft mare or gelding, 3 yrs. or older, Michael McSween had the second prize foal.

General Purposes Horses were out in strong numbers. E. J. Johnston had the best brood mare with a splendid type of Baron Majestic foal by her side. This mare captured the county sweepstakes prize for the best mare or gelding from Cape Breton County while the Richmond County honors in the same class went to a four year old mare shown by Geo. E. Bissett, St. Peters. John McQueen had no competition against his trim two-year-old. John Morley, Wood & McConnell and John McMullin came in for first, second and third prize honors in the three-year-old class. H. J. McLeod, Murdo McDonald and Rod McNeil had similar honors with their one-year-olds.

The honors in the foal class were captured in their respective order by E. J. Johnston, J. P. Redmond, Murdo McKenzie and Jas. McKenzie. The second and third prize brood mares were shown by R. Johnston and J. A. McCormack.

Carriage Horses.—Emery Wilkes, shown by Daniel Young was the only carriage stallion. John McQueen, J. T. Burchill and Wm. Andrews held the winners in the mare or gelding, 3 years or over, class. J. A. McCormack and Ira Hughes had no competition against their two-year-old and one-year-old respectively. Geo. L. Lund and J. C. McDonald held first and second winners with their brood mares with foals. John McQueen's mare won first with two of her progeny.

Roadsters.—The battle royal of the horse show was waged in the roadster class. The three-year-old stallion section was represented by three, good, standard breds, Royal Seal, Directum B. and Capt. McCuish winning the honors in the order mentioned for their respective owners, F. C. Redding, G. O. Purnes and A. F. McCuish. J. K. Hill's Colonel Snell, by Allie Snell captured the red ticket in the two-year-old stallion class from a stallion shown by P. Doherty as well as the Richmond County sweepstakes for best stallion, any age. Royal Seal captured the Cape Breton County sweepstakes prize for best stallion, any age. The other prizes in this class were awarded as follows;—

Mare or gelding, any breed, 3 yrs.—1, D. McRae; 2, W. Hood; 3, G. O. Purves; 4, J. H. McDonald.

Mare or gelding, any breed, 2 yrs.—1, H. A. Moffat; 2, Norman McLean; 3, W. S. Musgrave.

Mare or gelding, any breed, 1 yr.—1, Mrs. McKiegan; 2, W. L. Forman; 3, H. C. Musgrave; 4, 5, J. Webster Allen.

Brood mare with foal.—1, Robt. Johnston; 2, Alex McLeod; 3, James Hill.

Matched pair, in harness.—1, Robt. Johnston; 2, Alex McLeod; 3, W. L. Forman.

Brood mare and 2 of her progeny.—1, Robt. Johnston.

BARON MAJESTIC

Champion Clydesdale Stallion at the Sydney Exhibition. Baron Majestic was bred by C. R. H. Starr & Son, Port Williams. N. S., who exhibited him at the Maritime Horse Show, Amherst, N. S., in April 1911, where he won the Clyde Stallion Championship, in stiff competition, after which he was sold to his present owner, H. A. Moffatt, North Sydney, N. S.

CATTLE.

The cattle classes at the Cape Breton exhibition are steadily improving in point of quality and the number of pure breds is showing a decided gain. D. R. Nicholson and Ira Hughes showed fat cows, 3 years old and over and Jas. McKenzie had the only two-year-old fat heifer. C. H. Vail showed a yoke of aged working oxen. W. J. Reid, Instructor in Animal Husbandry, McDonald College, Que., placed the awards in the cattle classes to the utmost satisfaction of all concerned.

Holsteins were exhibited by D. R. Nicholson who captured the lion's share of the awards with a well fitted herd. The Port Hood Agricultural Society showed a two-year-old bull and captured the Inverness County sweepstakes prize for best bull, any age. Nicholson's aged bull, Bob Dorindo, had no competition in his class and captured the Cape Breton County sweepstakes for best Holstein bull. C. A. Nunn had the second prize senior bull calf and second prize dry cow, 4 years old. A. K. Jackson's cow came in for third money in the latter class. The other sections were well filled with good individuals from Nicholson's herd. Nicholson captured the first prize offered by R. H. Butts, M. P. P. for best herd pure bred cattle from any one farm in Cape Breton County.

Ayrshires.—South Bar and Salem Road Agricultural Societies were the only contestants in the aged bull section of the Ayrshire class. Their bulls were out in fine fittle and the first and second prizes were awarded in the order named. The South Bar bull is out of Annie Laurie the crack Ayrshire cow in the Truro College herd. He carried off the Cape Breton County Ayrshire bull sweepstakes prize. John H. Ross, of Margaree Harbor had no competition against his two-year-old bull, the only one from Inverness County.

D. J. McDougall, Christmas Island, showed a nice yearling bull while Hector McSween, Sydney, had the only bull calf. All prizes in the female sections with the exception of a first on yearling heifer which went to Peter H. Hawkins, Sydney, went to M. W. Ross & Son, Centerville. The second prize donated by R. H. Butts, M. P. P. for second best pure bred cattle exhibit was captured by Messrs Ross' Ayrshires.

Jerseys are increasing in numbers in Cape Breton. There were some very nice individuals in the ring, the most sensational winner being Ira Hughes's aged bull, that captured the County sweepstakes prize as well as the most coveted place in the cattle prize list—the male grand championship, all dairy breeds competing. Prize winners in the Jersey class were as follows:—

Bull, 3 years or over.—1, Ira Hughes; 2, North Sydney Agricultural Society.

Bull, over 2 years old and under 3 years.—1, W. Drysdale, Sydney; 2, Andrew McDonald, Meadows Road.

Bull, senior calf.—1, Donald Johnston, Leitches Creek; 2, Norman McLean, Grand Lake.

Bull, junior calf.—1, J. Webster Allen, North Sydney; 2, A. K. Jackson.

Cow, 4 years old.—1, D. R. Nicholson; 2, A. K. Jackson; 3, J. Webster Allen.

Dry cow, 4 years old.—1, A. K. Jackson.

Dry cow, 3 years old.—1, M. W. Ross & Son.

Heifer, over 2 years.—1, H. A. Moffat, North Sydney; 2, Mrs. H. A. Moffat.

Heifer, senior calf.—1 and 2, H. A. Moffat.

Heifer, junior calf.—1, D. R. Nicholson.

Best bull, Cape Breton County.—1, Ira Hughes.

Prize Winners at the Prince Edward Island Provincial Exhibition.

(Continued from page 6)

HOLSTEIN GRADES.

Cow, 4 yrs.—1, E. Heastz; 2, Lea & Clarke; 3, W. J. Gibson.

Heifer, 3 yrs.—1, Lea & Clarke; 2, E Heartz; 3, P. Robinson.

Heifer, 1 yr.—1, Lea & Clarke; 2, H. A. Robertson; 3, P. Robinson.

Heifer calf under 1 yr.—1, Lea & Clarke; 2, W. J. Gibson; 3, P. Horne.

Heifer calf under 6 months.—1 and 2, Lea & Clarke.

Heifer, 2 yrs.—1, Lea & Clarke; 2, H. A. Robertson; 3, P. Robinson.

SPECIAL PRIZES BY HOLSTEIN FREISIAN ASSOCIATION

All won by Lea & Clarke.

SPECIAL, DEPT. OF AGRICULTURE.

Farmer's son judging beef cattle.—1, Fred McRae; 2, Earl Ings; 3, W. W. Gibson; 4, Major McRae; 5, Leo Praught; 6, Geo. Godfrey.

Farmer's sons judging dairy cattle.—1, M. McRae; 2, Fred McRae; 3, W. W. Gibson; 4, Earl Ings; 5, Ernest Ings; 6, Howard Russell.

STEERS.

Pair of steers, 1 yr.—1, Heber Crosby; 2, Wood & Son.

Single steer, 1 yr.—1, 2, H. Crosby.

Pr. of steer calves of 1912.—1, S. C. Lane; 2, J. Praught.

MILK TEST.

Pure bred cow, 3 yrs.—1, Roper Bros; 2, Easton Bros.; 3, Lea & Clarke.

Pure bred heifer under 3 yrs.—1, Roper Bros; 2, C. H. Robertson.

Grade cow.—1, W. J. Gibson; 2, Roper Bros.; 3, Wm. Gregory.

Grade heifer.—1, Roper Bros.; 2, Andrew MacRae.

Holstein Ass'n cow.—1, 2 and 3, Lea & Clarke.

Sheep

SOUTHDOWNS.

Ram, 2 shears.—1, Cephas Nunn; 2, Oliver Saunders.

Ram, shearling.—1, O. Saunders; 2, C. Nunn.

Ram lamb.—1, C. Nunn; 2 and 3, O. Saunders.

Ewe, 2 shears.—1 and 2, C. Nunn; 3, O Saunders.

Ewe, shearling.—1 and 3, C. Nunn; 2, O. Saunders.

Ewe lamb.—1, C. Nunn; 2 and 3, O. Saunders.

Flock.—1, C. Nunn; 2 and 3, O. Saunders.

SHROPSHIRE DOWNS.

Ram, 2 shears.— 1, Geo. Boswall; 2, C. Nunn; 3, L. H. D. Foster.

Ram, shearling.—1, C. Nunn; 2 and 3, Geo. Boswall.

Ram lamb.—1 and 2, Geo. Boswall; 3, D. P. Irving.

Ewe, 2 shears.—1 and 2, Geo. Boswall; 3, C. Nunn.

Ewe, shearling.—1 and 2, Geo. Boswall; 3, C. Nunn.

Ewe lamb.—1 and 2, Geo. Boswall; 3, C. Nunn.

Flock.—1, Geo. Boswall; 2, C. Nunn.

DORSET HORNS.

Geo. L. Boswall claimed all first prizes on Dorsets. M. K. Boswall carried off the seconds except one in the ram lamb section.

LONG WOOL GRADES.

Ewe, 2 shears.—1, A. Boswall; 2, S. C. Lane; 3, S. L. Boswall.

Ewe, shearling.—1, S. S. Lane; 2, S. L. Boswall; 3, E. Lund.

Ewe lamb.—1, S. L. Boswall; 2 and 3, E. Lund.

Wether shearling.—1, A. Boswall; 2, Geo. L. Boswall.

Whether lamb.—1. S. L. Boswall; 2, S. C. Lane; 3, M. K. Boswall.

Fat ewe or wether.—1, S. L. Boswall; 2, S. C. Lane.

SHORT OR MEDIUM WOOL GRADES.

Ewe, 2 shears.—1, Albert Boswall; 2, O. Saunders; 3, Geof L. Boswall.

Ewe, shearling.—1 and 3, E Saunders; 2, O. Saunders.

Ewe lamb.—1, Geo. Boswall; 2, O. Saunders; 3, E. Saunders.

Wether shearling.—1, C. Nunn; 2, O. Saunders; 3, A. Boswall.

Wether lamb.—1, E. Saunders; 2, O. Saunders; 3, G. L. Boswall.

Best fat ewe or wether.—1, C. Nunn; 2, E. Saunders; 3, D. P. Irving.

Hewson special.—1, Geo. Boswall.

Humphrey special.—1, Geo. Boswall.

SWINE.

BERKSHIRES.

Boar, 2 yrs.—1, Wood & Son.

Boar, 1 yr.—1, Peter Brodie; 2, Roper Bros.

Boar over 6 months.—1, P. Brodie; 2, S. R. Ings.

Boar under 6 months.—1 and 3, W. J. Gibson; 2, Stewart Bros.

Sow, 2 yrs.—1, Roper Bros.; 2, W. J. Gibson; 3, P. Brodie.

Sow, 1 yr.—J. Burrigan; 2, P. Brodie; 3, Wood & Son.

Sow, 6 months.—1, P. Brodie; 2, Stewart Bros.

Sow under 6 months.—1, P. Brodie; 2 and 3, Stewart Bros.

Pair of pigs 3 months.—1, Stewart Bros.; 2, S. R. Ings; 3, P. Brodie.

CHESTER WHITES.

Boar, 2 yrs.—1, Wallace Stead; 2, T. W. Prowse.

Boar, 1 yr.—1, W. H. Cooke; 2, Geo. Crockett.

Boar over 6 months.—1, A. H. Boswall; 2, T. W. Prowse; 3, W. H. Cooke.

Boar under 6 months.—1, W. H. Court; 2, A. H. Boswall; 3, W. H. Cooke.

Sow, 2 yrs.—1, A. H. Boswall; 2, T. W. Prowse; 3, W. H. Cooke.

Sow, 1 yr.—1 and 2, T. W. Prowse.

Sow 6 months.—1, W. H. Cooke; 2, A. H. Boswall.

Sow under 6 months.—1, John Burrigan; 2, W. H. Court; 3, A. H. Boswall.

Pair of pigs 3 months.—1, W. H. Court; 2, A. H. Boswall; 3, H. H. Cooke.

Breeding Sow.—1, T. W. Prowse; 2, W. H. Cooke.

Sweepstake boar.—1, W. H. Cooke.

Sweepstake sow.—1, T. W. Prowse.

Pen.—1, T. W. Prowse.

EXPORT BACON HOGS.

2 pure bred hogs.—1, J. W. Callbeck; 2, W. J. Gibson; 3, Stewart Bros.

2 hogs cross or grade.—1, Geo. Crockett; 2, Jos. Praught.

Davies and Fraser's special.—1, Geo. Crockett; 2, W. J. Gibson; 3, P. Brodie.

Bank of Commerce Medal, best pen.—J. W. Callbeck.

White Queen

First Prize two-year-old Shorthorn heifer at the St. John Exhibition. Owned and exhibited by R. A. Snowball, Chatham, N. B.

Breeding sow.—1, Wood & Son; 2, S. R. Ings.

Sweepstake boar.—1, Stewart Bros.

Sweepstake sow.—1, P. Brodie.

Pen.—1, Stewart Bros.

R. E. Mutch Special.—1, Stewart Bros., 2, J. W. Callbeck.

YORKSHIRES.

Boar, 2 yrs.—1, J. W. Callbeck; 2, Stewart Bros.

Boar, 1 yr.—1, J. W. Callbeck; 2, Geo. Crockett.

Boar oper 6 months.—1, J. W. Callbeck; 2, Stewart Bros.; 3, A. A. McBeath.

Boar under 6 months.—1, J. W. Callbeck; 2, Wallace Stead;3, Geo. Crockett.

Sow, 2 yrs.—1 and 3, J. W. Callbeck; 2, Wallace Stead.

Sow, 1 yr.—1, J. W. Callbeck; 2, Stewart Bros.; 3, Geo. Crockett.

Sow, 6 months.—1, 2 and 3, J. W. Callbeck.

Sow under 6 months.—1and 2, Stewart Bros.; 3, J. W. Callbeck.

Pair of pigs, 3 months.—1, J. W. Callbeck; 2, Stewart Bros; 3, Geo. Crockett.

Breeding sow.—1, Stewart Bros.; 2, J. W. Callbeck; 3, Geo. Crockett.

Sweepstake boar.—1, J. W. Callbeck.

Sweepstake sow.—1, J. W. Callbeck.

Pen.—1, J. W. Callbeck.

Poultry

C-Cock, P-Pullet, Cr.-Cockerel, H-Hen.

Anconas, mottled.—1 C. 2 P. Cr., Geo. Callbeck; 1 H. 2 C. 1 P. Cr., E. J. Vessey; 3 Cr. P., John Whitlock.

Andalusian.—1 C., J. Holoran; 1 C. 2 P., Geo. Chilton; 1 P., W. H. Taylor.

Brahma, light or dark.—1 C. H. Cr. P. Geo. Peterson; 2 C. H., J. Btewart.

Cochin Buff.—1 C. H., Geo. Peterson.

Cochin a. o. v.—1 C., Geo. Peterson.

Dorking, a. variety.—1 C. H. Cr. and P., Neil McKinnon.

Hamburg S. S.—1 C. H. P. and Cr. 3 H., John Tweedy; 2 H., F. L. Haszard.

Hamburg, G. P.—1 C. and H., John Burke.

Hamburg, S. P.—1 C. 2 H. 1 and 3 Cr. and P., L. A. Haszard; 1 H. 2 C. Cr. and P., A. . Boswall.

Langshan black.—1 C. 2 H. 1 P. Cr. W. Williams; 1 H. 2 Cr. and P., A. Williams.

Leghorn, W. S. C.—1 C. Cr. P. 2 Cr John Whitlock; 1 H. 3 C., G. Cartier; 3 H. Cr. and P. 2 C., Geo. Chilton.

Leghorn Br. S. C.—1 C. P. Cr. John Whitlock; 2 and 3 H. C. Cr. P. Geo. Chilton.

Leghorn Br. or W. R. C.—1, H. C. P. Cr., G. Lf Simons.

Minorca Black S. C.—1, H. C., Chas. Pippy; 1and 2, Cr. and P. 2 and 3, C. and P., Wm. Cudmore.

Minorca Black R. C.—1, H. C. P. 2 Cr. 3 Cr., John Fraser; 1 Cr. 2 H., E. A. Cudmore.

Minorca Wh. S. C.—1 H. C., Gordon Carter; 2 H. C., Chas. Pippy; 1 P. 2 C. Cr., Byrne Bros.

Orpington Buff.—1 C. 2 H., E. S. Brown; 1 Cr. 2 H. P., L. A. Haszard; 2 C. 3 H., R. W. Jordan.

Orpington A. O. V.—1 C. 2 H., A. Williams; 1 Cr. P. H. 3 C., Henry Gurney; 2 C. 3 H., Nelson Whitlock.

Plymouth Rock Barred.—1 and 3 C. 2 H., L. H. D. Foster; 1 H. 2 C. Geo. Chilton; 1Cr., Heath Foster; 1 P. 2 Cr., Benj. Rodd; 2 P., A. H. McKinnon.

Plymouth Rock Wh.—1 C. P. 2 Cr. P. H., Geo. Callbeck; 1 H. Cr. 2C. John Ives.

Plymouth Rock Buff.—1 C. H. Cr. 2 P., L. A. Haszard; 2 C., Neil McKinnon; 1P. 2 Cr., L. H. D. Foster; 2 H. 3 C. H., Ena Foster.

Rhode Island Red S. C.—1 C. Cr. H. 2 H., L. A. Haszard; 1 H. 2 C. P., T. W. Prowse.

Rhode Island Red R. C.—1 C. H. Cr. P., W. A. Millar.

Spanish Black.—1 C. H., John Burke; 2 C. H., W. Duffy; 1 Cr. 2 H. P., Donald McWilliam; 1. P. 2 Cr., Geo. Chilton.

Wyandotte Silver.—1 C., Robt Hudson; 1 H. P. 2Cr., E. S. Brown; 1Cr. 2 C. H. P., John Fraser.

Wyandotte Wh.—1 C. H. 2 H., Ernest Weeks; 2 P. C. 1 Cr. 3 H., John Whitlock; 1 P. D. McKinnon.

Wyandotte Buff.—1 C. H. Cr. P., Robt Hudson.

Wyandotte A. O. V.—1 C. H. P., Fred Gregory; 1 C. and 2 P., Mrs. Wm. Gregory.

TURKEYS, GEESE,AND DUCKS.

Pair turkeys Bronze hatched 1912.—1, Albert Boswall; 2, Earl Boswall.

Geese Toulouse.—1, Almon Boswall.

Geese, Emden.—1 and 3, Mrs. A. Boswall; 2, Ernest Lund.

Geese, A. O. V.—1, Mrs. A. Boswall; 2, E. Lund.

Geese, Toulouse, hatched 1912.—1, Almon Boswall.

Geese Wh. B. and E. 1912.—1 and 2, Mrs. A. Boswall; 2, E. Lund.

Geese, A. O. V. of 1912.—1, Mrs. A. Boswall; 2, E. Lund.

Ducks, Rouen.—1, Albert Boswall Sr.; 2, Lile Boswall.

Ducks, Pekin.—1, Mrs. A. Boswall; 2, E. Lund.

Ducks, A. O. V. —1, Chas. Pippy.

Ducks, Rouen of 1912.—1, Lile Boswall; 2, Albert Boswall.

Ducks, Pekin of 1912.—1, Mrs. A. Boswall; 2, R. L. Days.

Ducks, A. O. V. of 1912.—1, Erl B. Boswall

Dairy Products

BUTTER, CHEESE, ETC.

Butter, box 28 lbs. creamery.—1, J. P. Simons; 2, Dunk River Dairy Co.

Butter, 2 firkins 20 lbs.—1, Miss E. Prowse; 2, Mrs. Geo. Auld; 3, Mrs. W. Darke.

Butter, 2 firkins 20 lbs. each.—1, J. P. Simons; 2, Dunk River Dairy Co.; 3, J. B. Vaubour.

Butter, crock 20 lbs.—1, Miss E. Prowse; 2, Mrs. Geo. Auld; 3, Mrs. A. H. Boswall.

5 lb. prints.—1, Mrs. L. H. Foster; 2, Miss D. Fraser; 3, H. H. Howard.

5 lbs. rolls.—1, Mrs. L. H. Foster; 2, Miss E. Prowse; 3, Miss D. Fraser.

5 lbs. prints, creamery.—1, Dunk River Dairy Co.; 2, J. P. Simons; 3, J. D. McRae.

Cheese, 2 dairy farm, 20 lbs. each.—1, Miss C. Drake.

(Continued on page 24)

One Man's Success With Sheep

A young man up in Conway, Mass, began farming a few years ago on an ordinary, rough, New England farm of 200 acres where he was born, with only his hands (and brains! and a debt of $3,000 and "with no kind of a show," writes Hollister Sage in Country Life in America. People laughed at him when he spoke of sheep. What could Herbert Lee do with sheep? Older men than he had tried them and failed. But he had made a study of the subject. He saw his opportunity. He believed he could make winter lambs pay, and pay well. His townsmen smiled. "How can Herbert get lambs to feed, in November, when nature decreed that they should be born in April? How could the little, tender things be kept from freezing in our December and January weather? Aircastles!"

Mr. Lee had run up against the great bugbear of farm life, the scarcity of good help. He reasoned that if eight sheep can be kept where one cow or steer will live, and there is no milking to be done night and morning, no milk to make up or to run with, to creamery or railroad, less help will be necessary. Also that if lambs sold at the holidays will bring twice or three times as much as when put on the market in summer, it will pay to make the effort in winter when comparatively idle, and time is plentiful. He decided that he would study sheep keeping at first hand and at home, and bought eight ewes. This is the equivalent of one cow. If a beginner in dairying will buy a cow, care for her himself and observe her closely, while reading everything available on dairying, he will presently know something about cows. Mr. Lee did this with eight sheep. And he learned much faster than he expected to. He has no facilities for sheep keeping—just the old barns on the ancestral farm. His first pens for lambs he made on the barn floor by hanging up blankets, and with so few, he had to provide some heat in the bitterest nights. This he did with lanterns, and raised eight beautiful lambs weighing nearly sixty pounds each, for which he received $100 about January. Here was encouragement of a substantial nature, and he decided that he would do some more, and accordingly increased his flock, did the work, put up with inconveniences and hardships, and continued to learn. It wasn't all smooth sailing, there were many setbacks and discouragements and times when everything seemed to go wrong, but he kept a clear brain and did not forget the cause and cure for reverses.

The larger flock paid well, and the lambs and wool kept the interest account settled and began to gnaw into the mortgage. This is the sort of thing which will give a man a thrill, no matter what people say. Unlike some successful flockmasters, Mr. Lee did not try to raise ewes to increase the flock. He struck out straight from the shoulder on the basis of cash, the same as if he were handling stocks and bonds instead of sheep and lambs. If a lamb would bring $12 in January or February at two months old, where was the sense in raising it when he could go out and buy a ewe in the spring when grass was plentiful and cheap and pay only $3.50 to $5 for it? And so the game was played and won each year, a goodly flock of fine-wool ewes being driven home from some near or distant farm, where "sheep do not pay" to increase the flock in spring, the old ewes fattened and turned into mutton, the fleeces sold, and the manure spread on the land. It was with intense gratification that this manager noted how the mowings were growing more and more productive each year, and the pastures greener, richer, and able to support more stock; how the recurring drouths affected them less and less, and the corn and other crops became more thrifty and abundant. All this he counted among his chief assets.

One single "extravagance" as his friends noted it, was his persistence in buying thoroughbred sires of the Southdown breed to head his flock each year, for that "blood will tell" was one of his foundation ideas in the industry. To spend $100 for a single sheep seemed like folly to most sheep men, but Mr. Lee had a weakness in this direction. Strangely he doesn't get over it, either. His experience only entrenches him more deeply in his eccentricity. His fine wool ewes he is sure are the best of mothers for winter lambs and take good care of twins, of which many arrive. Their wool is in demand, the fleeces weigh eight to twelve pounds each, and for several years have returned him $500 annually in cash. He says that one thing he particularly likes about sheep is the fact that they bring in money in good lump sums and not in driblets; that small amounts get away for all sorts of things and excuses, but that when the commission man hands him a check for $500 to $1,000 (once he got a roll of $1,5000 at one payment! he can put it in the bank. For several years now he has been able to drop $500 a year into the savings bank and not miss it, for besides supporting his family, he paid off his indebtedness in five years, and has cleared his mowings of stone very largely and put money into other improvements—better buildings and modern machinery—and has bought 350 acres to add to the farm, which is paid for. A mile and a half of new net fence was put up last year. Last winter he kept 400 sheep through, besides selling 125 lambs before March, realizing $10 and $12 per head. His aim is to make each one weigh up to the standard of sixty pounds in sixty days from birth.

The buildings in use are the same that have always occupied the ground but the interiors have been reconstructed, adding sheep features that experience has proved essential. The chief department of importance which the evolution has brought in is an enclosed shed under one side of the hay barn. It opens to the east and south, and was originally an earth-floored, wet, and semi-useless place. One of the tenets of Mr. Lee's faith in sheep is founded on the principle that they may be kept, the same as poultry, without fancy buildings and appurtenances. This shed was transformed into a wonderful place by a few poles from the woods, laid on stones for the mowings for piers, and covered with second-hand boards, which raised the floor 18 inches from the ground. Then the front was boarded up with the same old lumber, places roughly left to put in windows when the severest weather set in, and the floor covered one foot deep with forest leaves. The windows are opened between spells of hard weather, for sheep carry overcoats of the best pure wool, and will Rough feed racks for hay, with tight troughs in them for grain, and a water trough through which spring water runs the year round, are the principal dining-room equipments. At one side of this large pen, which will hold 300 sheep, is another forming an L and of about the same size. In the angle between the two is the bottom of a huge hay mow, containing at a rough guess, 300 tons of fragrant green hay.

The Economical Value of Bran

As a material which forms part of the ration for live stock bran has a two-fold value—it is a food of great excellence, and it is a laxative which enables the farmers and others who keep stock to use it in conjunction with such concentrated foods as beans peas, and decorticated cotton cake, all of which have somewhat of a binding action. Bran is therefore seldom used for cows which are feeding upon grass or forage crops. As a food bran has a three-fold value—it is rich in carbohydrates and minerals, although it is not customary to deal with the food from this point of view, in view of its value in the last-named materials, yet they are of great importance. A food containing lime and phosphoric acid in liberal quantities is not only essential to cows, whose milk provides these materials—and especially that used for cheese-making—but it is important for stock of all kinds, and especially growing stock, both lime and phosphorus being present in the bones. There are two kinds of bran, if we may take the liberty of drawing an imaginary line between the coarser and the finer samples—which, in truth, are found in various gradations—but the best is more particularly rich in starchy matter, is more floury and sweeter on the tongue, and possesses a more delightful aroma. In the coarser bran the waste material is greater, by which we mean the fibrous matter which is indigestible, and which in consequence reduces the feeding matter in the food—so much so, indeed, that it makes a considerable difference in the money value, however little difference there may be in the cost.

Farmers have been led to regard the starchy matter of foods as of less value than it really is in comparison with the albuminoids, but there is no doubt that we pay too much attention to the albuminoid constituents of all foods. Starch is practically the motive power, although this term applies more directly to the sugar. Thus carbohydrates heat the body and provide for the expenditure of energy, force, or movement, and for the production of a portion of the fat—possibly a large proportion—while the albuminoids are required simply for the maintenance of the nitrogenous portion of the carcase and the production of the casein of milk, or, in the case of fattening stock, of the muscular tissue, flesh and various organs of the body which contain nitrogen. Thus the part played by the albuminoids, if highly important and essential, is much smaller than that played by the carbohydrates, which are in consequence required in much larger quantity. It is true that the albuminoids in bran and similar foods can be also employed in the maintenance of heat, but at greater cost, not only in the purchase of the food, but at the expense of the animal.

Bran is of great value to stock of all kinds in time of sickness, when an appetizing laxative food is required. It is for this reason that bran mashes are employed, but it is a great mistake to employ them too frequently, owing to the large quantity of albuminoids bran contains. Where stock consume albuminoids which are not required by the body their organization is impaired by dealing with the excess; great strain is thrown upon the liver and kidneys, as in the case of man consuming too rich a meat diet. Good bran contains about 60 per cent. of digestible nutritious matter, about one-fifth being albuminoids. At £4 10s. to £5 per ton it is a food of moderate price, and may be consistently employed in mixing with a ration which consists of roots, chaff, bean meal and maize meal, or, in place of beans, decorticated cotton cake.

Most farmers prefer bran which is the produce of British stone mills, regarding roller-milled bran as too dry and impoverished a material. Imported brans are frequently of this character, and partake more of the outer husk than of the layers of the wheat berry, of which good bran is usually composed.

Salt For Stock

Physiologists differ in opinion as to whether salt (sodium chloride! is necessary to the welfare of stock, but experience points to a supply being very desirable, if not absolutely necessary. Apparently the theorists base their idea that salt is not an essential on the fact that vegetable food is naturally poor in sodium salts, and that the chief salt provided for the herbivora is potassium, which in their ordinary diet largely predominates over sodium; but they forget, or ignore, the fact that animals, especially vegetable feeders, in a state of nature, instinctively travel many miles to saline springs or incrustations or beds of salt, and that domesticated animals invariably avail themselves of the opportunity of taking it when offered. Bunge explains the desire shown by the herbivora for common salt as being due to the large amount of potassium salts consumed with their food, the effct of potassium salts in the blood being to withdraw sodium salts from the system, and states that when the proportion of potassium exceeds a certain ratio the animal instinct seeks for sodium. It may be also noted that sodium chloride is the only inorganic salt taken separately by the human subject in addition to that already existing in the food. The assumption, then, is a fair one that, except in the case of pigs and poultry, the regular or infrequent use of salt is essential for the maintenance of health.

Concerning its medicinal value, there is less difference of opinion. Small doses are restorative, stomachic and antiseptic; larger doses are cathartic and emetic. For vigorous adult cattle and sheep common salt is a purgative, resembling in its effects Epsom and Glauber salts, and frequently conjoined with them, as being more quickly absorbed. In bygone days a purgative dose of salt (½ lb. to 1 lb.) used to be greatly esteemed by farmers as a remedy for red water in cows. In cases of animals suffering from indigestion and irregular appetite, small and repeated doses are conjoined with gentian, ginger, and other vegetable tonics and stomachics with useful results.

PARASITES.

A lump of rock salt in the manger of the horse harbouring worms will often do more to expel the parasites, particularly the common round worm and keep the animal free, than large doses of vermicide medicine, usually considered more potent, a result attributable to its making the intestinal canal distasteful or uninhabitable. In the treatment of fluke disease, or liver "rot" in sheep, so far as it is successful, salt always plays an important part, and we are inclined to think that less would be heard of diseases associated with parasites—to which no inconsiderable proportion of the disease of stock, especially sheep, is due— if salt were more freely supplied. It is undoubtedly a powerful vermicide— nothing in the shape of a worm can tolerate it, and, as it is highly destructive to parasite life during certain stages of their existence outside the bodies of to render pasture safe from "rot", "gid," "husk," "tapeworm" and their natural hosts, salt dowing tends other parasitic diseases.

As some animals, like some men, seem to require a larger quantity of salt than others, and as the situation and the kind of food probably influences individual requirements, it is better to provide rock salt to lick than to mix a fixed quantity with the food, which may result in an excess in some cases or a deficiency in others.—Pateley Bridge.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishers, Limited,
Sussex, N. B.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

DATES OF ISSUE.

October 8-22
November 5-19

AN INVITATION TO YOU

About the only way a man can really get ahead is to mingle with people. We may read our books and papers and find out a great many things. We may read of how Bill Jones did this and Sam Fox did that many years ago. But we want to know how Bill Jones and Sam Fox are doing those things now.

Our school systems would not be worth a cent if our children could not mingle and express their ideas. Just because some book tells a child that two and two are four is no reason that the child will believe it. The teacher has to show the child how two and two make four. She has to exchange ideas with her pupils and have them give their ideas.

We have passed out of that school and are out in the first, second, third, fourth, fifth, etc., grades of the school of life. If we were to be left alone—away from other human influences—our minds would soon become stagnant. None of us want to become that way. We want to mingle. We want to visit our neighbors and talk things over with them about farm topics. We want to know the best way to make hens lay. We want to know the best ways of fattening hogs.

But perhaps our neighbors have the same methods that we have and we want to get the ideas of other neighbors. We might go to the different agricultural colleges and find out how these things are done, but perhaps we are too far away and cannot take the time to go.

In the columns of The Maritime Farmer Dairy ideas are exchanged every month. This is your farm paper. It is edlted with the idea of service. If we fall below the idea of service we will get out of business. We want to make this paper a part of the farm life of every man in the Maritime Provinces. We want the city man to read it and get the ideas of the farmer. We want the farmer to get the ideas of the city man. And we want farmers to get the ideas of other farmers.

We want our paper to be The Meeting House of Maritime farmers. The columns are open to you for your discussions. We are interested in everything for the betterment of farms and farm life. If you want to know about things ask your questions through this paper. Some one surely will answer you. Give your ideas and let others give theirs. Make this paper your meeting house and get acquainted.

"No, But We Have Something Just as Good"

"You're rather a young man to be left in charge of a drug shop," said the old gentleman. Have you any diploma?"

"Why, er-er-no, sir," replied the clerk, "but we have a preparation of our own that is just as good."

That "something just as good" is one of the bugbears of commerce.

It is a common method of foisting any-old-thing on the customer who asks for a particular article—and it is, in many cases, a thoroughly reprensible practice.

Usually this "something just as good" is offered as a substitute for an advertised article. In that way the storekeeper who "substitutes" turns the other fellow's expenditure of money to his own account.

It may be of course, that this "something just as good" is what the substitutor claims it to be—but usually it is not—or the substitution would come out into the open and advertise it, thus creating a legitimate demand for his product, on the articles own merit.

When the substitutor offers you "something just as good" he goes on the theory, usually, that this is the first time you have asked for the other article—and that in such circumstance you have no means of knowing whether the substitute is "as good."

Now if this product is not equal in quality to the article you asked for he has killed your faith in an advertised commodity—which is an economic crime, for he negatives a beneficial force of the most importance to you.

Don't accept substitutes.

You are taking a chance when you do.

If you call for a brand which you see advertised in THE MARITIME FARMER and the tradesman offers you something "just as good," dont take the substitute—go to the store that keeps what our advertisers are spending money to establish your faith in.

TAKE A VACATION

Farmers are quite liable to work year after year without taking a vacation. Of course we are amid the city people's vacation scenes much of our time, We are surrounded by the beauty and tranquility of nature while we carry on our life work. But in order to appreciate our happy surroundings to their fullest measure we must have an occasional change.

Though a day spent among the sights of a large city may prove tiresome, yet its benefits are often commensurately great. For when we return home we take up our work again with fresh vigor and keener insight. A trip to the state fair or to a grange convention may cause us more anxiety than would the same time spent on the farm. Yet this added effort, this breaking away from routine life, this new experience broadens our outlook upon life, develops new possibilities and latent faculties within us, deepens our sympathies, and altogether makes us more complete.

We should all have our play spells now and then. They are essentials in making our lives a success. The man or woman who can enjoy an innocent laugh and frolic is rarely morbid and melancholy. Through the disappointments and setbacks, so frequent in each of our lives, the quality of cheerful optimism is a powerful influence for happiness and success. We should all cultivate the ability to play, the capacity to have innocent fun, the faculty of enjoying ourselves.

Take a vacation. Let the world run itself as it must when you are dead.

SUCCESS WITH SHEEP

In various parts of Canada the interest in sheep raising is taking on new life. The work of the Sheep Commission has borne much fruit. Especially in the Maritime Provinces are there excellent opportunities for money making on the old farms.

On another page of this issue will be found an interesting story, which tells how one young man with little money and little experience made good on an old New England farm. Conditions in many parts of the Maritime Provinces are exactly similar. Let no young man discourage because of a big mortgage, opposition of friends and lack of experience. These will all give place to the metal that rings true. Note how it paid young Lee to pay $100.00 for a pure bred sire.

The article in question should interest many of our readers as at the present season the Dominion Live Stock Department is making an effort to encourage sheep raising in the Maritime Provinces by offering a number of pure bred sires and grade ewes at auction sale in central locations throughout our provinces by the sea.

POWER FOR THE FARM.

No subject is of more importance to the modern farmer than the matter of power. Hand labor is the most expensive kind, and in all lines of industry the greatest minds have striven to substitute mechanical energy for it wherever possible. Horse or mule power is also expensive because of the great amount of lost time during which these animals must be fed and cared for. The past quarter of a century has seen great development in the use of mechanical energy on farms, but nothing compared to what the present generation of farmers are likely to behold. We begin in this issue of Farm and Home a series of articles on the subject of farm power, prepared by an expert engineer, that is one of the most valuable expositions of the subject ever presented. It means a saving of much money to every farmer to carefully study this subject.

EDITORIAL NOTES

A good road, is a friend of the farmer. A mile of good road in his community is a bright spot in his life. It is an aid of education, religion and all things that help make the farm home life better.

The application of business principles to farming is proving that farming is after all the greatest business of them all, the main business from which all others branch.

Some Factors to be Considered in Purchasing Feed for Farm Animals.

Three factors stand out prominently in successful dairy production: First, the man; second, the cow; and third, the feed. It is only a phase of the latter subject that I am to discuss here.

We need to realize in order to comprehend the feeding problem in dairy-production that the dairy cow is an animated machine that has for her mission the conversion of feed into milk. Cow machines vary immensely in their efficiency. If we are to realize the most out of our feeds, we must, as a matter of course, see that they are fed to efficient cows.

Just what happens to the feed after it is consumed by the cow is a debatable question. As Ex-Governor Hoard, of Wisconsin, says, the inside of the cow is a dark place, and no man has yet been able to fathom all the mysteries wrapped up in the inside workings of her body.

MILK A GUIDE TO FEEDING.

There is, however, one fundamental principle that applies to cow machines as well as to all other machines, viz., that there must be in the feed ample and a properly proportioned supply of the raw materials that go to make up the finished product. What does the dairy cow need? If we analyze the product she manufactures, milk, we will get our cue. On an average, whole milk contains approximately the following ingredients:

Water ..... 87.22 per cent.
Ash ....71 per cent.
Casein and albumen 3.50 per cent.
Sugar ....4.88 per cent.
Fat ....3.69 per cent.

It stands to reason that the dairy cow in manufacturing this product must have the raw material, out of which the ingredients mentioned are formed, and must have it in sufficient quantity and in the right proportion. In addition to this, she must first of all be supplied with sufficient food material for the maintenance of her own body.

The first step in supplying the needs of our dairy cow is the analyzing of the different feed stuffs, and then submitting them to the chemical laboratory of the cow's stomach, and see how much and in what proportion the various feeding stuffs will supply the desired ingredients. In studying these feed stuffs there are several important factors to be considered.

DIGESTIBILITY OF FEEDS.

The total composition of a feeding stuff gives very little idea of its feeding value. Only that portion of the feed which can be digested and assimilated can in any way serve the animal for maintenance, growth or productive purposes. The disposition of the energy values in feeds is illustrated in the following table, constructed by H. P. Armsby, and published in the "Cyclopedia of American Agriculture."

ENERGY PER HUNDRED POUNDS.

	Clover hay.	Corn meal
Total energy	172,100 Cals.	170,900 Cals.
Loses in dung	73,600 Cals.	15,500 Cals.
Losses in urine	11,500 Cals.	6,500 Cals.
Losses in marsh gas	12,300 Cals.	15,900 Cals.
Total loss	97,400 Cals.	38,100 Cals.
Remainder	74,700 Cals.	132,800 Cals.

...This table takes the energy contained in the protein, carbohydrates, and other extracts and places them under the name of calories. (A calorie represents the amount of energy required to raise one pound of water four degrees F. in temperature.) It will be noticed from this table that clover hay contains more calories a cwt. than does corn meal, but it will also be noticed that the losses in the case of clover hay are much greater than in the case of corn meal, and that the remainder of the energy available for the use of the animal in its digestive and assimilative processes is much greater in corn meal.

The digestibility of a feed is a vital point in measuring its value, as it is the only part of the feed that can be used in the nourishment of animals. An animal hard at work needs to be fed plenty of grain in order to furnish the maximum pounds of nutrients that it is able to handle.

Many authorities measure the value of feed by its total digestible nutrients. This has been proved not to be entirely correct, for although a feed is digestible, it may contain more bulk, require a large amodnt of energy in chewing, in secreting digestive juices, and in warming up extra water for a suitable solvent. This is called by some, "the facility of digestion."

At the Connecticut Experiment Station (Storrs) an experiment was carried on with two 1,000 pound cows fed on a maintenance ration of 6½ lbs. of corn meal containing 4½ lbs. of digestible nutrients. The same cows required for maintenance 13½ lbs. of mixed hay containing 7.1 lbs. of digestible nutrients. In this instance one pound of digestible nutrients in corn was equal to 1.67 lbs. in mixed hay. Another experiment with pigs showed that 230 lbs. of digestible nutrients in skimmilk were required to produce 100 lbs. of gain. With skimmilk and shorts there were required 258 lbs. of digestible nutrients, and with shorts, 294 lbs.

MILK EASIEST TO DIGEST

All things considered, milk would rank first in facility of digestion, followed by concentrates, and roughage last. With roughage the facility of digestion is greater with early cut than late cut hay. It is greater with silage than corn stover.

An experiment with horses by Zunts and Hagerman, of Germany, shows the nutritive value of different feeding stuffs as follows:

Feeding Stuff.	Dry Matter.	Total digestible nutrients	Labor expended in chewing and digestion.	True nutritive value in terms of nutrients.
Medium hay (aver.quality)	85	39	21	18
Alfalfa hay cut first of bloom	84	45	22	23
Red clover hay	84	41	24	17
Winter wheat straw	86	18	30	—12
Oats (medium quality)	87	61	12	49
Maize	87	78	8	70
Field Beans..	86	72	11	61
Peas	86	69	10	59
Linseed cake	88	69	13	56
Potatoes	25	23	3	20
Carrots.....	15	11	2	9

It will be noticed from this table that 39 per cent. of the nutrients of medium hay are digestible, 21 per cent. of its nutrients are used up in chewing and digestion, leaving only 13 per cent as representing the net nutritive value. In a similar manner alfalfa hay has a net nutritive value of 23 per cent, clover hay 17 per cent. Wheat straw, however, required more energy in chewing and digesting than it contained in its digestible nutrients, making the net nutritive value, 12 per cent. less than nothing. It will be noticed that the grain contains a much higher percentage of net nutritive value.

ABOUT FEEDING STANDARDS.

To furnish a finished animal product the animal must be supplied with the right kind and right quantity of raw material. The standards that have been adopted as a result of numerous experiments indicate how much protein, carbohydrates and ether extract they need under various conditions and circumstances. While these standards are by no means absolute they serve our purpose as guides.

Our farm feeds usually conatin ample quantities of carbohydrates and ether extract, but where alfalfa and clover are not grown in large quantities, there is a likelihood of being a deficiency in protein, and when buying concentrated feeds, we usually buy them, not for the carbohydrates, but for the protein.

Before purchasing these we need to settle whether we need protein nutrients or total nutrients. If it is the former, we will select some nitrogenous roughage, as alfalfa, clover, or cow pea hay, and for grain, oil meal, linseed meal, gluten meal, or other highly nitrogenous feeds. The selection of these feeds and the grouping of them to make what is known as a balanced ration has been agitated through our institutes and the agricultural press, and are now familiar to all leading stock breeders. For properly balancing our live stock rations, we cannot put too much emphasis on the value of alfalfa and clover as abundant sources of digestible nitrogenous nutrients. 6

PALATABILITY.

The relish with which an animal eats its feed has much to do with the effect of that feed on the body. It regulates the amount eaten, and when properly assimilated the more the animal eats, the larger amount of product it turns out. By supplying an animal with food that it eats readily, it will help it to eat its other food better and in larger amounts. A palatable food stimulates the digestive juices and the supposed benefit of many of our stock foods rests in the palatability that they may impart to other foods. It is important to preserve this quality as far as possible in all feeds.

Hay should be so cured that the animals are anxious for it. Greediness of appetite is a great factor in economical production of live stock products. Any feed that will so regulate the animal as to keep it in good health and condition will add much to the final results. Linseed meal, corn silage and roots are all examples of feeds that are greatly relished by our live stock.

VARIETY.

Variety is very closely related to palatability. It helps to keep the appetite keen and the animal healthy and vigorous. By having several feeds, one can supplement the other as one may be deficient in ash, and this deficiency made up by the other. Recent experiments show that ash plays a very important part in the nutrition of farm animals. It is also known that the digestible protein in one feed does not necessarily possess the same nutritive value as the digestible protein in another feed.

By feeding a variety, one will make up where the other falls down, and the feeder can feel reasonably sure that he is giving his animals sufficient nutrients, even though we do not in our present knowledge, know the exact function of these nutrients.—Prof. D. H. Otis, University of Wisconsin.

Why I Spread Manure in Winter.

There are so many good reasons why manure should be hauled to the field daily and spread that it is always a wonder to me that more of my neighbors do not adopt the system which I have practised for years so successfully. I was visiting a farmer recently in an adjoining county who was famed for getting his work done promptly and with a minimum of help. With three horses and one man besides himself last spring he put in 25 acres of grain and 25 acres of corn.

"How did you do it?" I asked.

"By distributing the work over the whole year and not trying to do it all in a few days in the spring," was his answer.

Just then we happened to be going around the corner of the barn, and I saw the litter carrier run out of the stable and dump itself directly into the manure spreader. Some time later the hired man was seen hitching the team to the spreader and starting off for the field.

"You see," said my neighbor, "that when spring opens up, the manure will not only be in the field, but it will be spread as well, and we will be ready to start right ahead plowing the ground for corn instead of making a great big rush to get two or three hundred loads of manure drawn out to the field and spread in a very limited time."

I have found since I adopted the system of hauling out manure daily that I can get my spring work done one week ahead of what I previously did. At the same time, the fertility of the manure is conserved when applied directly to the land. Any of the soluble ingredients which are washed out into the soil are there ready to assist the crop growth next spring.

The fermentation in the manure heap, which I believe causes a great deal of loss before the manure ever reaches the field at all, is avoided. Institute lecturers have told us that this fermentation is due to the life activities of small plants called bacteria, and that these plants cannot work except in warm temperatures. When manure is spread directly it is frozen, and there being no chance to here, the bacteria are not able to work.

REASONS FOR HAULING DIRECT.

Hauling out the manure is good exercise for the horses. To be kept in the best condition horses should get a little exercise every day of the year, and as the manure on our farm is hauled out every day but Sunday, this work answers requirements nicely.

I have been told that this system cannot be followed on hilly farms as too much of the fertilizing ingredients would be washed away. Personally I do not believe that they would be washed very far, but had I a hilly farm, I would at least haul the manure out and le it where it would be convenient next spring.

Storing Seed Potatoes.

Seed potatoes in storage have three very definite requirements. They must be kept in a cool place well ventilated and dark. That the potatoes be kept cool is most important. The best temperature is from 33 to 35 degrees. If the temperature falls below 32 degrees there is danger of freezing, although it takes a slightly lower temperature to freeze potatoes than water. Good ventilation is necessary in order to prevent the spread of rot, and it is well to keep the potatoes dark, so they will not start to sprout at any time. A cool, dark, well ventilated cellar fairly dry is the best place to store seed potatoes on the ordinary farm. As spring comes in, seed potatoes should not be allowed to send out the long, pale, spindly shoots so often seen. This may be prevented by keeping the potatoes cool and dark. Some of the eastern growers, three or four weeks before planting time, spread their seed potatoes out in the light at a temperature of 60 to 70 degrees, and here allow them to develop sprouts a half to an inch long. These are strong, stubby little sprouts, that are not broken off in planting. It is said this process both hastens the maturity of the crop and increases the the yield.—B. H. Thorne, Hayne County, O.

HORTICULTURE.

The English Pomeroy Walnut

Owners of country estates and orchardists throughout the United States are just now devoting more attention to the culture of the English or Persian walnut than to any other industry. In fact, horticulturalists everywhere are tremendously interested in the propagation of this delicious fruit, both from a commercial and a aesthetic point of view.

For many years the English walnut has been cultivated with more than ordinary success in California, but only very recently has a sufficiently hardy variety been found to withstand the severe winters of the northern, eastern and south-eastern states. The circumstances pertaining to the discovery of an unusually harnut, may be related as follows:

The late Norman Pomeroy of Lockport, N. Y., while attending the Centennial exposition in Philadelphia in 1876, noticed a species of tree totally new to him. On investigation, he found it to be an English walnut tree of surprising beauty. It was the fall of the year and the ground underneath the tree was covered with nuts. These proved to be equal, if not superior, to the taste, to any of the imported varieties with which Mr. Pomeroy was familiar.

Being thoroughly versed in arbor culture, Mr. Pomeroy propagated young trees from this acclimated variety, feeling certain that from these he would ultimately obtain an English walnut of superior hardiness, capable of resisting the rigors of almost any climate.

He planted these young trees about his residence in Niagara County, N. Y., in the spring of 1877 and they grew steadily, making surprising growths each year until now they stand fully 50 feet high, with a spread to their branches of 40 to 45 feet, and yielding nuts of the finest quality and in great abundance. During the 35 years of growth where the temperature has frequently descended far below (ero, they have not had a single setback, maturing even earlier than the black walnut or the oak.

The elder Pomeroy's remarkable success has attracted the attention of nut cdlturists, horticulturists and progressive farmers in all parts of this country and in Europe. Nut specialists from California came east and examined the Pomeroy trees, and were well satisfied that a hardy variety for the colder states had at last been found.

Realizing the value of his father's discovery, Mr. E. C. Pomeroy, a few years ago, set out several orchards of the variety which had thriven so well, and all these trees are now in a fine state of healthy growth, and are known by nut growers all over the country. Only the other day a prominent physican in Atlantic City, just returned from a tour of Austria, told Mr. Pomeroy of the fame which his orchards enjoyed abroad. As an instance of this, the doctor mentioned the name of an Austrian nut grower, who declared the Pomeroy nut to be the very best variety in the world. These nuts do not become rancid in warm weather, having been kept for several years in perfect condition, without cold storage.

So profitable has the culture of the English walnut in the Eastern and Northern states become, that owners of farms and suburban tracts are beginning to set out large orchards, in preparation for the immense demand that is already being shown for this most edible of all nuts.

It is only a few years ago that the cultivation of the English walnuts for the market started in California, and today they are shipped from that state in car and train loads. To show, however, that the supply does not begin to meet the demand in this country, it may be stated that the United States consumes more than 50,000,000 pounds of English walnuts a year, and that about 27,000,000 pounds of these have to be imported every year. And when it is known that the price is steadily advancing, it will very readily be seen that the possibilities of commercial success are unusually great.

In California the nut industry is rivaling that of the orange; and even now, there are more dollars worth of nuts shipped from the state per year than there are of oranges. This statement is meant to include all varieties of nuts, although the English walnut figures largest in the proportion.

As to planting and cultivating, English walnut trees seem to require no particular soil, but should not be set out where it is low and wet. The trees should be planted 40 to 50 feet apart each way. A cultivated crop, such as corn or potatoes, with small fruit trees for fillers, can be made to yield an income for the brief period, compatatively, before the walnuts begin to bear. The pruning should be done between fall and spring, only such branches as would interfere with cultivation being removed.

In planting on the lawn the ground about the base of the tree should be kept spaded for three feet in circumference, but after the first year some well-rooted manure should be worked into the soil around the tree. No cultivating should be done after the first of August, as it would encourage further growth, and from then until winter the annual growth of wood is ripening and hardening.

No more beautiful shade tree is known than the English walnut. They make comparatively no litter, have a pure white bark, very closely resembling that of the white birch, and bear a heavy foliage with a rich, glossy leaf. They are almost immune from insect pests, a certain alkali sap which they possess serving to drive away the parasites which are so ruinous to the chestnut and nearly all other fruit trees.

In the English walnut at its best, the male and female blossoms mature at the same time, insuring perfect fertilization. Under favorable circumstances the trees will bear nuts three to five years from transplanting and increase in yield yearly. As a food, nuts are becoming less a luxury and more a staple article of diet. Their value is being recognized and they are being used more and more as a substitute for meat, one pound of walnut meat being said to equal eight pounds of steak, in nutriment.

In transplantation, most growers have found that two to four-year-old trees are most readily transplanted. At this age most of their growth has been in roots, and removal causes them to throw out additional roots, and thus give increased vigor to the tree. Then again, the smaller the tree, the more safely may it be packed and shipped to its destination.

The eastern grower has many advantages over his rival of the West. First of all, there is the consideration of freight charges, which on a carload from California amounts to such a sum that added to the cost of the nut, naturally increases the price per pound several cents over the variety grown in the East and placed in an Eastern market.

A California grower of English walnuts who recently visited an orchard in western New York declared the specimens which he saw there to be "the very finest I have ever seen." "You have a better flavored nut and you have proved beyond a doubt that the variety is thrifty and hardy," were his exact words. This same grower said that his few acres of young California trees gave him in 1911 a crop which he sold for $10,000.

The After Care of Strawberries

After the strawberry crop is gathered the plants will require special cultural attention if they are to remain for the production of berries the succeeding year. The limited cultivation possible while the crop is developing in the spring is not sufficient to keep down weeds, so that under ordinary conditions these are present in a liberal number and generous size, and demand removal by the time one can get to them after the harvest. Old plants that have spent their energy will only obstruct the chances of the patch for another season. These need to be cut out with the weeds. The soil stirred but little and packed hard by the repeated trampings of the pickers, is in a poor state to begin the growth of new plants and ripen another crop of berries. Deep and frequent cultivation is the only way to put this soil in condition, and if it lacks in the elements of fertility there should be added and worked into the soil a quantity of well-rotted barnyard manure, or commercial fertilizers if the former is lacking, or both, to replenish the plant food taken out by the last crop. After this has been done the old crowns will send out runners in every direction. If these are permitted to establish themselves at random it would be but a short time till all trace of the old rows is obliterated. The prevention lies in training the new plants into rows corresponding to those occupied by the old plants. This is done by following a special method of culture. Run a one-horse plow about six inches from the centre of each row on both sides, throwing the soil away from the row, thus leaving an undisturbed portion one foot wide. With a hoe the weeds are removed and the runners pulled around so that the plants developing from them will be on the narrow strip unplowed. This confines them to the row and permits cultivation to the end of the season. In the cultivation that follows a rolling cutter fastened to the side of the cultivator will sever all new runners that attempt to grow into the spaces between the rows and thus keep the spaces clean. This stirring of the soil provides conditions for the development of sturdy plants.

Parasites Attack Caterpillar Pest.

According to Mr. R. W. Shepherd pomological expert, Como, the farmers who have taken care of their orchards will make money this year, and the prospects for crops generally are good, and there will be no caterpillar pest next season. Mr. Shepherd sized the situation up as a full crop of early apples, a fair crop of Fameuse, with McIntosh Red amost a failure. The apples are free from fungous growths, owing to favorable weather, and are of fine size

That there is no prospect of a tent caterpillar plague next spring, is attributed to a parasite attacking the caterpillars. He had examined thousands of the cocoons spun by the caterpillars, and found that in almost every instance they were barren, the caterpillars having failed to form chrysales. Any great rush of caterpillars was generally followed by a murderous parasite.

Apples Wanted.

A large fruit importer of Buenos Ayres, desires to be placed in communication with shippers of Canadian apples; c.i.f. quotations are required, for fruit in lots of 1,000 barrels, and boxes in similar quantities. In each of these cases, further particulars may be obtained from the Department of Trade and Commerce, Ottawa. Mention inquiry No. 246.

Dr. Morse's Indian Root Pills

are made according to a formula in use nearly a century ago among the Indians, and learned from them by Dr. Morse. Though repeated attempts have been made, by physicians and chemists, it has been found impossible to improve the formula or the pills. Dr. Morse's Indian Root Pills are a household remedy throughout the world for Constipation and all Kidney and Liver troubles. They act promptly and effectively, and 49

NEW CENTURY WASHING MACHINE

The Washer of the Present and the Future

Scientists tell us that some day no person will do hard manual labor—machines will do it all. The first great step has already been accomplished, as far as household work is concerned. The New Century Washer, not only takes all the hard manual labor away from washing, but it washes clothes better than such work has ever been done before. The water tap furnishes the power, the New Century does nearly all the rest.

Washing-machines are not new but the New Century is. The other kinds did *some* of the work, the New Century does almost *all* the work. The others gave trouble, the New Century saves trouble. The difference is in the patented and exclusive features of the New Century. Ask your dealer about them or send to us for full information.

CUMMER-DOWSWELL, LIMITED
HAMILTON, ONTARIO

If you have young children you have perhaps noticed that disorders of the stomach are their most common ailment. To correct this you will find Chamberlain's Stomach and Liver Tablets excellent. They are easy and pleasant to take, and mild and gentle in effect. For sale by all dealers.

Apple Scab and Grading of Apples.

Our correspondents almost everywhere report that apple scab is very prevalent this season. Undoubtedly there will be more than the usual tempation to brand as "No. 1" apples not strictly up to the grade. The reputation of Canadian apples has suffered in the past on account of the fraudently and carelessly packed fruit of a comparatively few dealers and growers, working a great hardship to those who grow clean fruit and pack it honestly.

Special attention is drawn, therefore, to Section 321 (b) (111) of the Inspection and Sale Act, Part 9, which provides that No. 1 fruit shall "include no culls and "consist of well grown specimens of one variety, sound, of not less than medium size "and of good colour for the variety, of normal shape and not less than 90 per cent. free from scab, worm holes, bruises and other defects, and properly packed."

An increased staff of fruit in spectors will be on duty this season both at shipping points and at the point of distribution, and every provision is being made to examine as large a quantity of fruit as possible. Fruit for local markets must conform to the law as well as that for export.

Copies of the Inspection and Sale Act, Part 9, (dealing with fruit and fruit packages) can be obtained on application to the Fruit Division, Ottawa.—A. McNeil, Chief Fruit Division, Ottawa.

Effect of Sawdust on Plants.

There is in Great Britain a general belief among farmers and gardeners that farmyard or stable manure made with sawdust as litter is injurious to plants, or at least is not so valuable as that made with straw. This belief is apparently aslo widespread among gardeners in America, and in order to ascertain if there is any real foundation for it, experiments were begun in 1908, and continued on a large scale for three years with flowering plants grown in greenhouses. Comparisons were made between (1) cow manure made with sawdust as litter; (2) cow manure made with straw or chopped corn stalks as litter; (3) cow manure free from litter of any kind, the cows being on a cement floor without bedding.

The manure was collected and left in a heap until some fermentation had taken place. This broke down the strawy litter considerably but the sawdust had quite a fresh appearance when it was applied. The same amounts of the different manures were used, and they were all thoroughly worked into the soil. The plants tested were roses, carnations, chrysanthemums, and sweet peas. In no case could any harmful effect of the sawdust be detected, and in fact, taking the average of the three years the manure containing it gave slightly the largest number of blooms. For other reasons, however, it was concluded that for the particular circumstance manure without litter of any kind was the best.—Journal of the Board of agriculture.

Paying Apple Varieties

"The older orchards of this country have grown up in connection with general farming, and very few men have kept any records of their trees. Further, the age of profitable bearing has come down probably five years in the last decade, by reason of intensive cultivation, and modern methods of pruning. Where in our early experience we pruned to make good appearing large trees, we now prune to shorten in and to induce bud growth in bearing wood to get apples. I really do not know what variety is paying best. Gravenstein, Ribston, Stark, Ben Davis and Salome make up the bulk of my crop. The best market apple of the bunch, the King, is, I think, the least profitable of these, and I would say, in twenty years, the Baldwin has been the most profitable. In planting a commercial orchard, I would use these varieties named above, adding for fillers the Wagener. My apples in the past five years in the Berwick Co-Operative Association have averaged me as follows:—

Kings, $2.7 ; Ribstons, $2.45; Baldwins, $2.62; Stark, $2.57; Spy, $2.96; G. Russet, $2.99; Gravenstein, $8.70; Blenheim, $2.62. These prices are for No. 1 stock, while No. 2's were 50cts. less. We furnished the barrels. This company shipped 40,000 barrels last season.—S. C. Parker, Berwick, N. S. in Farmers' Magazine.

Protection is cheaper than feed

MAKE your live stock comfortable this winter and your profits will show an increase. When you put up a new house, barn, chicken house or farm building you want a durable roof that is not going to leak—one that retards fire. You will get this kind of a roof if you use

Certain-teed Rubber Roofing

Quality Certified Durability Guaranteed
Comes in Shingles or Rolls

D you have to feed your chickens additional corn to keep them warm in winter? You can make your chicken house cozy, dry and warm by using *Certain-teed* Rubber Roofing on the sides as well as the roof. *Certain-teed* Roofing is made from best materials—that is why we guarantee it for 15 years—but it lasts much longer.

Valuable Book B-U-5 "How to Build for Less Money FREE

You do not have to wade through a maze of complicated directions

to lay *Certain-teed* Rubber Roofing—hammer and nails only necessary, just the thing for that chicken house or pig shelter that you want to erect quickly and yet have it light, durable and inexpensive. *Certain-teed* Rubber Roofing is more durable than shingles or metal and costs less

Certain-teed Rubber Roofing is sold throughout the provinces of Canada by local dealers and is distributed by wholesale jobbers in St. Johns, Halifax, Quebec, Montreal, Ottawa, Toronto, London, Winnipeg, Calgary, Saskatoon, Edmonton, Regina, Moose Jaw, Brandon, Vancouver, Victoria.

The market for all linesof produce is holding fairly good. There is a tendency in some lines toward a decline. The potato market is in a peculiar condition. Buyers are a little shy because of stock not showing keeping quality. The crop is a good one, when all sections are considered. Our neighbors in Northern Maine and Ontario, have a big yield. But with all this we are looking for fair prices after the first of the year. Our market has broadened considerably in the past two or three years. If Ontario or the United States do not require our surplus, the West Indies can be counted on to furnish us with a reasonable sure outlet. The time has passed when the grower of good potatoes can be caught with stock he cannot dispose of at a reasonable margin. Turnips and other root crops have not yet come on the market in any quantities. At this season there is rather too much produce forced on the market. The growers in the river sections have to get what they have to dispose off to market while navagation is open. We would strongly advise men who have railway communication, not to be too anxious to market their produce. This market at best is only a small one and every advantage is taken of an over supply.

Poultry has hardly maintained the place it should have, considering the quality of the stock offered. Poultry raising in New Brunswick shows signs of development. If the growth and quality are maintained, outside markets will have to be secured, otherwise prices will decline to a point where the raising of chickens will be unprofitable. There is another side to the poultry business that shows a brighter prospect. Eggs are high, higher than they have been for a number of years at this time and they are going to stay. Prince Edward Island gave this market a few hundred cases a few weeks ago and there was joy in the consumer's heart for a short season, as prices went down two cents a dozen, but some of the stock was not up to sample and New Brunswick production is again

Order Your Thresher At Once from The Sussex Manufacturing Co., Ltd.

THE threshing season will soon be at its best and you will want a Thresher in a hurry. We have ready for shipment, Two, Four and Eight Horse Power separators. Either of these machines can be supplied with Tailings Elevator, Bagger and equipped with Trucks. Every machine is given a thorough testing before leaving the factory and is fully guaranteed.

Four Horse Thresher with Tailings Elevator.

Are you thinking of buying a Root Pulper or Farmer's Feed Boiler this season ? If you have not one, you certainly should have. We have a large stock and you can have circulars on same for the asking.

We also have, for the farming trade, Hay Presses, Wood Cutters, Garden Seeders, Grain Grinders, Rubber Belting, etc. Write at once,

THE SUSSEX MANUFACTURING COMPANY LIMITED, SUSSEX, N. B.

Built To Give Lasting Service

NO cream separator in the world is made from finer materials than the STANDARD. For instance, the Gear Spindles are made from a special grade of tool steel, ground and polished—a steel so hard and wear-resistent that tools are made from it, for drilling through ordinary steel. This special tool steel costs five times as much as steel in ordinary separators, but ten ordinary spindles wear out before one STANDARD spindle.

The STANDARDS' Discs are made of steel, heavily and smoothly tinned. Stand on one and test its strength in comparison with alluminum or tinned iron discs.

The Bowl Bottom is made of special steel forging. If the STANDARD'S bowl falls on the floor it won't bend or break.

Standard

Not the Only Reason

In fact, every part of the STANDARD cream separator is built to give lasting service. But that's not the only reason you have for selecting the Standard cream separator. There are, for instance, several features that add greatly to the convenience and satisfaction of owning a STANDARD.

For example, there is the Wide Open Bowl, so easy to get at and wash. No tubes to clog up, either. Then there is the disc holder on which the discs are all washed together in about one minute. The discs are numbered so that they cannot be put together wrong.

Then, too, the STANDARD Bowl doesnt leak. That's because the bowl shell fits tight without screwing down on top of a rubber ring, causing wear on the rubber and allowing the milk to leak through when the bowl is revolving.

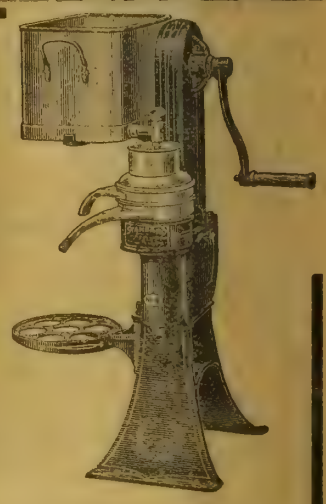
Another good feature is the Interchangeable Clutch. When you stop the crank the gears all stop and the bowl runs down of its own accord and without wear. The Interchangeable Clutch also enables you to "pump" the handle and start the STANDARD quickly and easily.

Other Big Features

Other big features of the STANDARD, such as the Self-Oiling System—The Centre Balanced Bowl—The Liberal Space Between Disc Edges and Bowl for Accumulation of Impurities—The High Crank Shaft—The Low Supply Can—The Enclosed Dust-Proof Gearing, were emphasized in previous advertisements.

So why go further. You've already learned enough to know that the Standard is the convenient and efficient machine, and is built to last long. In fact, tests go to show that the STANDARD should give 25 years of service.

One test given the STANDARD was equal to skimming 100 pounds of milk every day for six years. At the completion ef the test, there was no wear visible on the working parts. The STANDARD was easily good for 20 years of service after the test.



Write for Booklets

We take it for granted you are interested in this test. And we would like to send you our booklet describing it fully. Also booklets showing construction of the STANDARD and containing records of skimming tests. Send us your name and address promptly. The booklets will be mailed to you by return mail.

FOR SALE

A well matured Guernsey bull, a handsome fellow and gentle as an old cow. A dandy sire, very active and dependable. His breeding will satisfy the most exacting, he's in fine condition as he has been well cared for. Somebody will get a great bargain as he will be sold for only a small p. c. above what he would bring on the market for beef. The figure at which he is held will put him on the cars at St. John. Full particulars given on enquiry. SARAH E. MOSES SMITH, Woodward Cove, Grand Manan.

in demand at an advance.

Fruits of all kinds are plentiful and of excellent quality. Our fruit growers are now producing a fine line or I should say, those men who are making a study of this particular branch, York and Carleton counties are leading in fruit culture. G. C. Cosser, at Lower Gagetown, is making a distinct success of fruit growing. He has already shipped a quantity of apples to England, where his stock has taken a place among the high grade fruit. The right variety of fruit carefully and honestly packed soon put him in the market right. This applies, not only to fruit, but all lines of produce.

Dairy products are firming up. There has been no radical advance, but a steady gradual stiffening of prices. St. John milk dealers are agitating an advance of one cent per quart to consumers. In fact, we understand this advance is to be tried out at once. West-side dealers are asking and receiving 8c per quart, we hear to-day. We might say in connection with these comments, that we do not know of a business which will stand more reformation than the retail milk business as now conducted in the city of St. John.— G. W. Hoegg.

A Council of War.

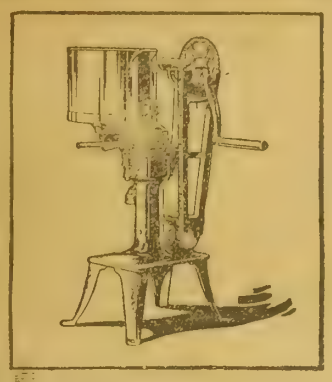
Editor Maritime Farmer:

The question which is being most seriously discussed among the fruit growers of the Annapolis Valley at the present time is what regulations shall they ask the Government to pass in regard to future importation of nursery stock into the Province. As has been quite extensively advertised, from two to three per cent. of the nursery stock shipped into Nova Scotia during the past year or more has been found to be infested with living San Jose scale. During the past summer the Department of Agriculture has spent thousands of dollars endeavoring to eradicate this invasion of the scale. Assuming that it may be possible to eradicate what scale has already gained entrance to the Province, the fruit growers are now interested in preventing any more importation of this dangerous pest.

With this in view, a public meeting of fruit growers will be held at the Kentville Court House on Thursday, Oct. 24th at 2 o'clock at which the fruit growers and others interested will be given an opportunity of presenting their views to the Government with data upon which to pass regulations upon this important matter.—M. Cumming.

Now Importing Cattle.

Both Canadian and Mexican cattle are being imported under present conditions. Mexican are mainly thin cattle for maturing purposes, but Canadians are beef, all ready for the butcher. Several consignments from Toronto, Ont., have reached Buffalo this week, and speculators gathering them have secured handsome profits. Ontario cattlemen find their usual export outlet at this season closed, owing to the relative cheapness of Argentine beef in Great Britain, but Toronto is $1 per cwt. lower than Buffalo, and several heavy shipments are expected to cross the Niagara frontier in consequence. Cattle selling at $7 in Toronto are easily worth $8 at Chicago or Buffalo, and the duty, intended to be prohibitory, has ceased, temporarily at least, to be a barrier. Only the Mexican insurrection has prevented 25,000 Mexican cattle from crossing the Rio Grande weekly this summer. Most of the have been siezed by the revolutionists, and gathering on the open range under present conditions is impossible.—Live Stock World, Chicago.



IHC
Cream Separators Have Trouble-Proof Neck Bearings

GRANTING that a cream separator is a money making necessity on every farm where three or more cows are kept, there are two points to make sure of when you purchase your machine—close skimming and long life.

There is very little skimming difference between separators when new but there is a tremendous difference in the length of service they will give. The difference is due to design and mechanical construction. To take one example of mechanical efficiency

IHC Cream Separators Dairymaid and Bluebell

have trouble proof, self aligning, bowl spindle bearings. The bowl spindle bearing or neck bearing is an extremely important part of the separator mechanism. Its business is to reduce to the lowest possible point the vibration of a heavy bowl whirling at the rate of 6,000 or more revolutions per minute. A rigid bearing in such a place is impossible. To make a flexible bearing capable of withstanding the terrific strain requires the most accurate balance of strength, firmness, and elasticity. In I H C cream separators this balance is acquired by the use of one spring. There is only one wearing part, a phosphor bronze bushing. The entire bearing is protected from dirt or milk by steel cases. There is but one adjustment and that easy to make.

Go to the I H C local agent who handles these machines and ask him to show you how successfully this bearing meets all the difficulties imposed upon it. He will also show you many other reasons why I H C cream separators, made in four sizes, are the best. Get catalogues and full information from him, or write the nearest branch house.

LIVE STOCK.

Maggots and Sheep.

August and September are probably the two worst months of the season for fly attacks on sheep. Prevention is better than cure, and shepherds attending sheep at present should be careful in keeping them scrupulously clean. Fly attacks will occur at times in the best-managed flocks, but with less virulency. Keeping sheep should be properly dipped at least twice a year with a reliable mixture early in summer and late in autumn. It is sometimes desirable in the depth of winter to dip sheep if they are badly infested with vermin. They settle and thrive so much better that the small outlay for dipping is amply repaid. Fresh weather should be chosen, and the cold air taken from the dip by adding hot water occasiooally, which will generally prevent any ill-effects fram the operation. Every sheep should be submerged for one full minute, otherwise the most efficacious dip will prove ineffectual. Frequently both labor and cost are litefally thrown away by entrusting this important operation to careless and incompetent men who may consider it a dirty job, and the sooner over the better. In dipping in this careless fashion the sheep are no sooner into the pool than they are out again, and when carrying a rough coat of wool in the autumn and winter they are never wet to the skin at all. If a thing is worth doing at all it is worth doing well, and it will pay any owner of sheep to give the operation of dipping a close personal supervision, standing with watch in hand to see that both sheep and dip get justice. Frequent dipping, however, will not prevent fly attacks in their season for more than a week or two after the operation. The atmosphere exhausts the offensive smell, and its resisting powers become neutralized. Light warm showers and bright intervening blinks of sunshine or thick dewy mornings with sunshine during the height of the day are the weather conditions most favorable to fly attacks. Scour in sheep renders them very susceptible to attack; indeed, there are probably more attacks from this cause than from all other causes combined, hence the necessity of cleanliness. Whenever scour is observed in a sheep it should be caught and thoroughly cleaned. All the soiled fringes of wool should be carefully shorn away, gnd the parts cleaned and dried. A handy pocket bottle should be kept by shepherds constantly during the season, for the development of fly attacks is the work of a few hours. A very good bottle is one part of Cuff's oil to twenty parts of water. This should be lightly sprinkled over the discoloured parts and rubbed well in with the hand. Other dressings may be necessary if the maggots have developed to any great extent. Fly attacks are also traceable to starlings. Opinion is divided as to whether these birds are the friends or the enemies of sheep owners. Possibly they may be both at the same time. They pick large numbers of keds from the sheep when they crawl to the surface of the wool in bright sunshine, and are extremely useful in this way. On the other hand, they are a frequent cause of fly attacks, baecause when picking the parasites from the backs of the sheep they drop their excrement on the wool, which is at once selected as a cluster spot for a fly deposit. It is not unusual to see hundreds of those bright active birds perched on the heads and backs of sheep, and in the fly seasons numbers of sheep are "struck," although the weather is not damp with desultory bursts of sunshine nor any scour apparent in the sheep, demonstrating fully tnat it is to the peculiarly foetid nature of the excrement of starlings that the pest is attributable. When the fly-blow is allowed to develop into maggots before being touched it entails an enormous amount of suffering on the poor animal as well as loss to the owner. Such carelessness is almost unpardonable in an attendant. Sometimes sheep are eaten through the bowels by maggots, and death, of course ensues. Such cases are indescribable and revolting to humanity. In cases where the skin and flesh of the animal are broken the maggots should be dislodged by means of gently scraping with the back of a pen knife and Cuff oil rubbed well into and about the affected parts. Sheep should never be permitted to become infested to such a degree, as the indications of maggots are generally apparent even to an ordinary observer, When attacked sheep display much restlessness. They will frequently shake their tails, turn round, and scratch with their teeth, run forward with the head extended and squat down suddenly. They will repeat this uneasy jerking hour after hour with short intervales of rest, and not infrequently they isolate themselves from the fiock and lie in an obscure and hidden corner of the field.—Farm and Home, England.

To Ensure Good Chewing.

The cow, sheep and animals that chew the cud have four stomachs and a very perfect arrangement for grinding their food.

Grain should be fed with roughage, as then it goes into the first stomach and will be rechewed. If the grain is eaten alone it is apt to go to the third stomach and so miss the rechewing.

To make sure that the feed is thoroughly chewed, feed it with roughage. The best way is to cut the hay or straw, mix the grain feed with it, then it will go through the whole grinding process.

Loss in Weight of Fat Cattle

Cattle lose in weight on their way to the slaughter-house. This loss should be calculated as exactly as possible by the owner, so that on consulting the quotations of the slaughter-houses he may be able to ascertain the real worth of his cattle.

The above work endeavors to determine the amount of this loss.

Messrs. Herter and Wilsdorf asked the exhibitors in the 35 th Berlin Cattle show to give them the exact weights of the animals before they were sent to Berlin. On their being again weighed when they arrived, it was found that 25 calves had lost on an average 5.16 per cent., and 238 full-grown animals 5.47 per cent.

At the 36th Berlin Cattle Show, 1910, more exact details were obtained.

The losses in weight on the journey showed great individual differences, and did not appear to depend alone on the time involved. Differences of age and sex, of biological and physiological condition, perhaps also of food, were doubtless the other determining factors.

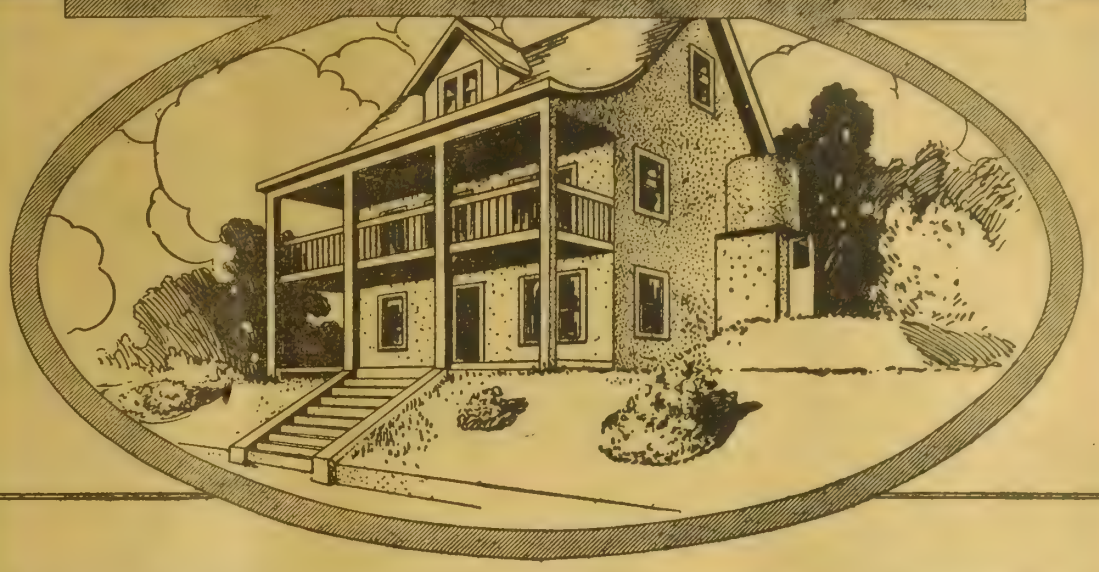
The following shows the average results obtained:

Forty-two calves, up to 4½ months old, weighed an average of 3.33 cwts. each, lost 4.2 per cent. weight during transport over 167¾ miles of railway, making 23.60 miles of railway travel lose 2.2 lbs. weight in each animal. Eleven bulls aged 3½ years and up weighed 18.77 cwts. before a railway travel of 148½ miles, which lost them 4.5 per cent. of their weight, 3.47 miles of railway travel causing 2.2 pounds of loss to each bull. Twenty-seven cows aged 3½ years and up and weighing 14.34 cwts. travelled 138 miles with a loss during the trip of 4.9 per cent. of their weight, 3.85 miles of railway causing 2.2 pounds loss. Eighteen young bulls under 3½ years and weighing 17.05 cwts. lost 5.5 per cent. of their weight in travelling by rail 159 miles, a loss of 2.2 pounds for each 3.10 miles carried. Eight cows from 2½ to 3½ years of age and weighing 12.55 cwts., lost 5.9 per cent. of their weight in travelling 204½ miles, a loss of 2.2 pounds for each 5.40 miles carried. Fifty steers aged 3½ years and up and weighing 15.69 cwts. lost 6.1 per cent. in travelling 210½ miles, a loss of 2.2 pounds in weight for each 4.28 miles carried. Forty-three heifers and steers under 3½ years and weighing 11.68 cwts. lost 6.5 per cent. weight in travelling 248½ miles, a loss of 2.2 pounds for each 6.46 miles carried. One hundred and forty-five steers from 2½ to 3½ years old weighed an average of 13.42 cwts., and lost 7.3 per cent. in travelling 192 miles, making the loss of 2.2 pounds cover but each 3.85 miles of travel.

Trans-Atlantic Cattle Trade Dwindling

That the export trade in beef cattle from Canada and the United States to Great Britain has been rapidly falling off is made evident by figures from the Deptford Foreign Cattle Market. This is one of the British coast markets established for the reception and slaughter of imported animals, and for years it has received supplies only from Canada and the United States. In 1907 the number of cattle received was 184,971, but this dwindled down to just under 100,000 in 1811, and for the first half of this year the total was only 21,547 head. This reduction, however, must, in all fairness, be partly attributed to the disturbed industrial conditions in the shipping trade. But at the same time the situation has became so serious that the committee in charge have been casting about to know how to meet the financial losses of the market through lack of business, and they have had to advise the taking of severe radical steps in order to make the market pay its way.—The Nor' West Farmer.

Write for the "Concrete Book"



IN Canada, where the winters are long and cold, houses must be solid and substantial. No "gingerbread frills," such as distinguish California bungalows, can be permitted. Canadian homes should be built to defy wind and cold, to keep warm inside when it's thirty below out-doors.

IT is because Concrete, of all materials, best withstands wind, water and cold, that it is fast becoming popular with Canadian home-builders. Concrete houses are warm in winter, requiring less coal for heating; they are cool in summer. A Concrete house never needs repairs; because, instead of decaying, it actually grows stronger with time and exposure to the elements.

VERY attractive architectural effects may be obtained with Concrete, especially for houses in the country, where the rough concrete surface harmonizes with its surroundings.

SINCE it never requires repairs, the first cost of a concrete residence is its last cost; and it is cheaper, for this reason, than any other kind of home.

NOT only is Concrete the best material for house-building. It may also be used in scores of other ways around the home and on the farm. For each of these purposes it is the best material known.

IF you haven't investigated the use of Concrete around the home and on the farm, write now for our free book, which tells all about the mixing and placing of Concrete, and describes hundreds of practical uses for it. Just say "Send me your book" in a letter or on a post card, and the book will be sent you absolutely free.

THE HORSE.

The Nose Bag and Wisdom.

Now this is no argument that a horse knows more than a man, but—

A farmer sent his hired man to town with a load of hay. The hired man was provided with nose-bags to feed oats to his team. One of the bags had straps so short that when the man fastened them the horse's nose was shoved too deep down into the bag, and the horse, (without check-rein, thank, goodness!) deliberately hooked the end of the wagon-tongue into the mouth of the bag, and tore the bag loose from his head, and ate the oats from the ground.

The straps of the second nose-bag were so long that the hungry horse could not get at the oats at all, so he kept tossing his head, thus throwing the oats into his open mouth.

Here are two horses which knew more than their driver.

A man was plowing. He had fastened the reins across his shoulders in the usual fashion, leaving both hands free to guide the plow. But the reins were all skew-gee on his shoulders, and kept pulling his horses "gee," whilst he yelled "haw"—and this man reported to the owner of the horses: "Them horses are dum fools!"

All right!

When a collar hurts, the average horse winces upon being asked to throw his weight into the collar. Later, he becomes what we foolishly call balky, perhaps— and finally he fights like an army mule when someone tries to put a collar on him. That's knowing something!

I am personally acquainted with a horse which simply hates a certain blacksmith who once upon a time nailed a bad-fitting pair of shoes to his feet and inflicted sore feet upon this horse for all time to come.

There are men in this world of ours cruel enough to fasten a horse with a heavy rope in a stall and then beat the horse WITH A CHAIN. But such men have "bad luck," and forever afterward if the horse which has received this sort of dicipline hears a chain rattle he will bolt in terror, whether hitched to a mowing-machine, a carriage with children in it or a heavy wagon loaded with produce. This is either horse sense or horse revenge.

A fine horse doesn't know so much as an inferior dog, but a horse has some sense. Perhaps it would remember this we would get along better with the motive power on the farm. Some wise men resort to flattery to gain the good will of horses.

A Need for Good Horses.

The farmer who breeds or buys a lot of ewes does so primarily with a view to raising lambs and, in the second place, to converting the ewes, when they cease to be desirable as breeders, into mutton and wool.

He who owns cows uses them first for dairy and breeding purposes, and as soon as they cease profitably to "fill the bill" in those respects, converts them into beef, or sells them as they are.

But how often does the owner appear quite unable to see any use for the most valuable individual animal on his farm, possibly a well-bred mare? He sees no value in her other than as an item in his cultivating machinery. Possibly it may strike him that he would like a colt by her, but he often fears, through ignorance, to endanger her usefulness or her health if he puts her to the additional labors of maternity. He does not know that, if properly used, he adds to her value in both these respects. He has not studied the matter, perhaps.

If, however, after consulting his neighbors, he determines to try for a colt, he knows no better than to mate her with the nearest and cheapest stallion that comes handy, without paying any special attention to that stallion's breeding or fitness of crossing with his pet mare.

I remember when once upon a time I was standing at his stable door in a small Illinois town, talking to a man who had several stallions, a well appearing farmer drove up with a nicely bred and impressive-looking Clydesdale mare hitched to the back of his wagon. While he and the horseman went into the stable, I looked the mare over and thought to myself; why, here's a man who owns a little gold mine. I wonder if he knows it? Curious to get this query answered, I followed them into the stablestable, somewhat, as I thought to the disgust of the horseman, who, however, said nothing; and I heard the following conversation:

Horseman—"Well, it's all the same to me which you use, but here's the hoss I should recommend. He's a Clydesdale, same as your mare, and he has all the points she is short of. I paid a long price for him two years ago; he's just six now; and as she is about two-thirds bred, and a good one, she one, she will be apt to throw you a colt you may be proud of. He comes rather high—I always get fifty dollars for his services, but as you are a neighbor and as I would like to have a colt by him in the neighborhood that would do him justice, I'll give you the chance for twenty-five dollars. He'll cost you less to rear than a scrub and pay you well."

Farmer.—"That is more than I can give just now. I was told you could give me the service of a good horse for ten dollars."

Horseman—"Well, yes; I have a mighty good hoss you can use at ten dollars cash down, and you can bring the mare back if needed. Joe," to his stable man, "bring out Greg Eagle. He is getting a little old, and though he's a thoroughbred Percheron I got him cheap because the importer was hard up. He has done me good service at my other place in Indiana."

So Grey Ragle came out, a good-looking. lively chap, full of fire and glee. I put him down as at least twenty years old and wondered much to myself, if the prosposed union came off, what sort of a baby would come to bless the maternal instincts of the mare from the "land o' cakes.' The bargain was concluded, but what the results of this too typical example of injudicious horse-breeding were I never knew. But I do know that the method followed was not the best to pursue if one desires to reap a share of the rich harvest to be found in the breeding of farm and draft horses. John P. Ross, in Farm and Fireside.

Sick headache is caused by a disordered stomach. Take Chamberlain's Tablets and correct that and the headaches will disappear. For sale by all dealers.

Use of Scales in Feeding.

The best and practically the only way one can tell whether his animals are making proper gains or not is by the use of scales.

A friend of mine who gave me the data used here tried this on a colt last year. The colt weighed 130 lbs. when foaled and was weighed every week for the first six months, with the following results: Three and three-fourths pounds average daily gain first month, three and one-fourth pounds average daily gain the second month, three pounds average daily gain the fifth and sixth months.

At ten months the colt weighed 870 pounds and had made a daily gain of about two and one-fourth pounds, which is very good for a grade Percheron.

The colt was allowed all the whole oats and bran it would clean up until five months old. Her mother was worked nearly every day, and the colt sucked four times a day from eight o'clock in the morning to five o'clock in the afternoon. At night both mare and colt were turned out to pasture.

The winter ration consisted of a mixture of five pounds of whole oats, two pounds of shelled corn, and five quarts of skim-milk daily. A small amount of silage and mixed hay for roughage were also fed.

From the observations made by this man it will be seen that the average farm colt should make a daily gain of at least two pounds per day. Also, that good colts can be raised when the mares are working. From previous experience in using scales in feeding, this farmer says that a colt should weigh at ten months one half of its weight at maturity.—W. A. Dopke.

Horsemen Attention!

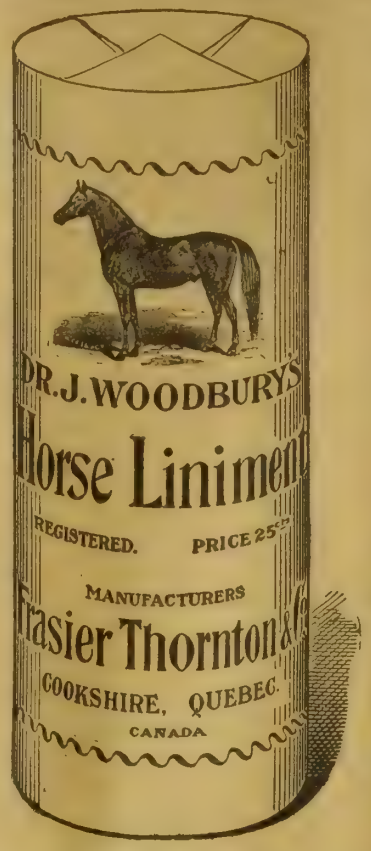
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distempr, Glanders, Spavins, Pink Ey, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

Demand

DR. J. Woodbury's

Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

ABSORBINE

Cures Strained, Puffy Ankles, Lymphangitis, Poll Evil, Fistula, Boils, Sores, Wire Cuts, Bruises, Swellings, Lameness, and allays Pain quickly without Blistering, removing the hair, or laying the horse up. Pleasant to use. $2.00 per bottle, delivered. Describe your case for special instructions and Book 5 E free.

Before After

ABSORBINE, J.R., liniment for mankind. For Strains, Painful, Knotted, Swollen Veins, Milk Leg, Gout. Price $1.00 per bottle at dealers or delivered. W. F. YOUNG, P.D.F., 124 Lymans Bldg., Montreal, Ca.

POULTRY.

The Improvement of Poultry for Market Purposes.

J. P. Laundry, Poultry Manager and Lecturer at the Nova Scotia Agricultural College, writes:

"I am enclosing herewith a copy of an address by J. J. Ferguson, Swift & Company, before the International Association of Instructors and Investigators of Poultry Husbandry, Agricultural College, Michigan, June 27, 1912. It explains conditions very well and such as we have them here in the poultry and egg trade. I would be pleased to see this paper reproduced in your poultry columns. We are organizing an egg circle at Southern Nova Scotia to try out the plan."

"During the last ten years the population of this country increased practically twenty per cent. whereas the supply of meat producing animals showed practically no increase. The ranches and ranges of the great West have been broken up to meet the encroachment of the homesteader and small farmer, consequently, the plains country will not furnish any considerable portion of our meat food supply until the primary stage of grain growing has been passed and the farmers of the West engaged in live stock production. There is, therefore, no reasonable possibility that for years to come the production of meat foods may overtake the demand.

The poultry business offers an immediate, profitable source of supply, as poultry can be raised almost anywhere in the United States. The original investment is small, returns come quickly and with proper care and feeding returns are larger in proportion to the capital invested than in any other line of live stock operation.

There is no danger of the poultry business being over-done. In 1911 production of the American hen was valued at over $620,000,000. This enormous production was readily absorbed; in fact, was not equal to the demand as shown by the steady advance in prices for poultry and eggs during the season of heavy consumption.

In 1899 the average price of eggs for the year was 11.15c per dozen; in 1909 the average price was 19.7c with a steady demand for everything offered.

A dozen years ago the handling of poultry and eggs in a commercial way was carried on without much system. About that time some of the meat packers entered the field with equipment to handle the product in a systematic and sanitary manner. No other feature of a commercial food supply has shown such a scientific development with such beneficial results affecting both producer and consumer.

The price which the poultry man receives and the price which the consumer pays for poultry and eggs depends entirely upon the supply and demand and the relative quality of the produce. The chief difficulty in the way of general improvement in quality lies with the small producer; not in other words, the farmer who is educated to the necessity of taking the same care with poultry and eggs he devotes to cattle and hogs. With most farmers poultry and eggs are by-products of a business usually left to the care of the small boy or the women on the farm.

To furnish products of prime quality farmers must feed their birds properly and market eggs as fresh as possible. Each additional day of age does not add to the selling price or eating quality of an egg. Side-road egg buyers and country storekeepers are responsible for much of the deterioration in the quality of market eggs.

Swift & Comuany have in successful operation a large number of Branch Houses through which poultry and eggs are received practically direct from the farmers. By this close contact the farmer learns to breed, feed and finish the kind of birds which suit the market and are the most profitable to him.

The quality of commercial poultry and eggs depends primarily upon the producer. Between him and the consumer come a chain of buyers, handlers and the ultimate retailer. Such firms as ours, having well equipped cold storage plants for receiving and storing poultry and eggs, refrigerator cars in which to ship to distributing points and cold storage Branch Houses in hundreds of cities and towns, are in the best possible position to effect the distribution of these products with a minimum loss in quality between the poultry yard and the consumer's table. There has been a tremendous improvement in the quality of poultry and eggs on the market since the meat packers entered the produce business and applied their organization and experience to the systematic sanitary handling of these important food supplies.

Under the ordinary system of handling poultry and eggs there are too many middlemen between the producer and the consumer.

Many middlemen have not modern equipment to handle these products—as a result, there is often serious deterioration in quality.

Under our system of Branch Poultry Houses located in good territory dressed poultry and eggs are moved to storage or to the retailer in the shortest possible time, under the most sanitary conditions.

While in some cases it may be possible and desirable for the farmer or poultry man to furnish dressed poultry and eggs direct to high grade customers in cities and towns, this trade will always remain but a fraction of the total volume of business handled over the country. There is a steadily growing disinclination on the part of the high-grade city customer to bother with trade direct from the country, the preference being to concentrate as far as possible purchase of food supplies in one place. The bulk of distribution must always be made through retail meat and provision stores where housewives can purchase practically all food supplies with the greatest economy of time and effort.

The Experiment Stations, Schools of Poultry Instruction and Poultry Journals are doing splendid work, but a large part of it is done for the poultry fancier, breeder and professional exhibitor of purebred poultry. This class of poultrymen have but little to do with the great commercial poultry interests of the country, and Experiment Stations might well devote more time and effort to reaching the average farmer who looks to poultry and eggs as a source of steadily increasing revenue.

In conclusion Swift & Company's system of handling poultry and eggs was explained and a cordial invitation issued to the Instructors present to visit Swift & Company's Plant and Branch Poultry Houses and study the system in detail. The invitation was most enthusiastically received, several of the Instructors present announcing their intention to visit some of the Swift Plants during vacation this summer.

Gombault's Caustic Balsam

The Worlds Greatest and Surest Veterinary Remedy

HAS IMITATORS BUT NO COMPETITORS!

SAFE, SPEEDY AND POSITIVE.

Supersedes All Cautery or Firing. Invaluable as a CURE for

Poultry Houses.

There isn't even a nail missing in the description of the three poultry houses given in a bulletin, No. 132, "Farm Poultry Houses," just issued by the Iowa Agricultural Experiment Station at Ames.

Every detail and every step of construction is made clear by photographs showing the exterior and interior alike, and by builder's drawings showing the method of construction throughout, and by bills of materials that include every item needed.

Three types of houses are described, two movable and one stationary. The "A" shaped movable house may be built at a cost of $39.00. The "Iowa Colony House," used first at the Iowa Poultry farm at the station, costs about $58.00. The stationary house is larger than either and may be built for about $173.00 or $180.00, depending on whether lumber and concrete or hollow tile and concrete are used.

The Iowa Agricultural Experiment Station will send these bulletins on request.

Lameness in Ducks.

When ducks become lame from no apparent cause it is usually due to their sleeping quarters being damp. Ducks are easily affected in the feet and legs by dampness and cold. They will remain in the water for hours, but they are then exercising. When they return to their quarters they require a dry place. The most successful persons with ducks provide board floors, which are littered deeply with cut straw or hay, which are regularly moved as soon as it becomes in the least degree damp or filthy. By carefully attending to the ducks in this respect there will be fewer cases of lameness among them.

A Few Doses of VIGORA Succeeded in Curing His Horses

MR. J. B. MORIN:—
I, the undersigned, Henri Talbot, carter, declare that I bought VIGORA for my horse which was troubled with breathing. A few bottles of this remedy cured it immediately and my horse is now well.
HENRI TALBOT, carter, Quebec.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

EACH HAS A MISSION.

There's never a rose in all the world!
But makes some green spray sweeter;
There's never a wind in all the sky!
But makes some bird wing fleeter;
There's never a star but brings to Heaven
Some silver radiance tender;
And never a rosy cloud but helps
To crown the sunset splendor;
No robin but may thrill some heart
His dawnlight gladly voicing.
God gives us all some small, sweet way
To set the world rejoicing.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

"And my dear boy," cried my mother, coming to the elbow-chair in which I was, and caressing me, "my own little Davy! Is it to be hinted to me that I am wanting in affection for my precious treasure, the dearest little fellow that ever was!"

"Nobody never went and hinted no such a thing," said Peggotty.

"You did Peggotty;" returned my mother; "You know you did. What else was it possible to infer from what you said, you unkind creature, when you know as well as I do, that on his account only last quarter I wouldn't buy myself a new parasol, though the old green one is frayed frayed the whole way up, and the fringe is perfectly mangy? You know it is, Peggotty; you can't deny it." Then, turning affectionately to me, with her cheek against mine, "Am I a naughty mama to you, Davy? Am I a nasty, cruel, selfish, bad mama? Say I am, my child; say 'yes" dear boy, and Peggotty will love you; and Peggotty's love is a great deal better than mine, Davy. I don't love you at all, do I?"

At this, we all fell a-crying together. I think I was the loudest of the party, but I am sure we were all sincere about it. I was quite heart-broken myself, and am afraid that in the first transports of wounded tenderness I called Peggotty a "Beast." That honest creature was in deep affliction, I remember, and must have become quite buttonless on the occasion; for a little volley of those explosives went off, when, after having made it up with my mother, she kneeled down by the elbow chair, and made it up with me.

We went to bed greatly dejected. My sobs kept waking me, for a long time; and when one very strong sob quite hoisted me up in bed, I found my mother sitting on the coverlet, and leaning over me. I fell asleep in her arms, after that, and slept soundly.

Whether it was the following Sunday when I saw the gentleman again, or whether there was any greater lapse of time before he re'appeared, I cannot recall. I don't profess to be clear about dates. But there he was, in church, and he walked home with us afterwards. He came in, too, to look at a famous geranium we had, in the parlor window. It did not appear to me that he took much notice of it, but before he went he asked my mother to give him a bit of the blossom. She begged him to choose it for himself, but he refused to do that—I could not understand why—so she plucked it for him, and gave it into his hand. He said he would never, never, part with it any more; and I thought he must be quite a fool not to know that it would fall to pieces in a day or two.

Peggotty began to be less with us, of an evening, than she had always been. My mother defrrred to her very much--more than usual, it occurred to me—and we were all three excellent friends; still we were different from what we used to be, and were not so comfortable among ourselves. Sometimes I fancied that Peggotty perhaps objected to my mother's wearing all the pretty dresses she had in her drawers, or to be going so often to visit at the neighbors; but I couldn't, to my satisfaction, make out how it was.

Gradually, I became used to seeing the gentleman with the black whiskers. I liked him no better than at first, and had the same uneasy jealously of him; but if I had any reason for it beyond a child's instinctive dislike, and a general idea that Peggotty and I could make much of my mother without any help, it certainly was not the reason that I might have found if I had been older. No such thing came to my mind, or near it. I could observe, in little pieces, as it were; but as to making a net of a number of these pieces, and catching anybody in it, that was, as yet, beyond me.

One autumn morning I was with my mother in the front garden, when Mr. Murdstone—I knew him by that name now—came by, on horseback. He reined up his horse to salute my mother, and said he was going to Lowestoft to see some friends who were there with a yacht, and merrily proposed to take me on the saddle before him if I would like the ride.

The air was so clear and pleasant, and the horse seemed to like the idea of the saddle so much himself, as he stood snorting and pawing at the garden gate, that I had a great desire to go. So I was sent upstairs to Peggotty to be made spruce; and, in the meantime Mr. Murdstone dismounted, and, with his horse's bridle drawn over his arm, walked slowly up and down on the outer side of the sweet brier fence, while my mother walked slowly up and down on the inner, to keep him company. I recollect Peggotty and I peeping out at them from my little window; I recollect how closely they seemed to be examining the sweetbriar between them, as they strolled along; and how, from being in a perfectly angelic temper, Peggotty turned cross in a moment, and brushed my hair the wrong way, excessively hard.

Mr. Murdstone and I were soon off, and trotting along on the green turf by the side of the road. He held me quite easily with one arm, and I don't think I was restless usually; but I could not make up my mind to sit in front of him without turning my head sometimes, and looking up in his face. He had that kind of shallow black eye—I want a better word to express an eye that has no depth in it to be looked into—which, when it is abstracted, seems, from some peculiarity of light, to be disfigured, for a moment at a time, by a cast. Several times when I glanced at him, I observed that appearance with a sort of awe, and wondered what he was thinking about so closely. His hair and whiskers were blacker and thicker, looked at so near, than even I had given them credit for being. A squareness about the lower part of his face, and the dotted indication of the strong black beard he shaved close every day, reminded me of the wax-work that had travelled into our neighborhood some half-a-year before. This, his regular eye brows, and the rich white, and black, and brown, of his complexion—confound his complexion, and his memory!—made me think of him, in spite of my misgivings, a very handsome man. I have no doubt that my poor dear mother thought him so too.

We went to a hotel by the sea, where two gentlemen were smoking cigars in a room by themselves. Each of them was lying on at least four chairs, and had a large rough jacket on. In a corner was a heap of coats and boot-cloaks, and a flag, all bundled up together.

They both rolled on their feet, in an untidy sort of manner, when we came in, and said, "Halloa, Murdstone! We thought you were dead!"

"Not yet," said Mr, Murdstone.

"And who's this shaver?" said one of the gentleman, taking hold of me.

"That's Davy," returned Mr. Murdstone.

"Davy who?" said the gentleman. "Jones?"

"Copperfield," said Mr. Murdstone.

"What! Bewitching Mrs. Copperfield's incumbrance?" cried the gentleman. "The pretty little widow?"

"Quinion," said Mr. Murdstone, "take care, if you please. Somebody's sharp."

"Who is?" asked the gentleman, laughing.

I looked up, quickly; being curious to know.

"Only Brooks of Sheffield," said Mr. Murdstone.

I was quite relieved to find that it was only Brooks of Sheffield; for, at first, I really thought it was I.

There seemed to be something very comical in the reputation of Mr. Brooks of Sheffield, for both the gentlemen laughed heartily when he was mentioned, and Mr. Murdstone was a good deal amused also. After some laughing, the gentleman whom he had called Quinion said:

And what is the opinion of Brooks of Sheffield, in reference to the projected business?"

"Why, I don't know that Brooks understands much about it at present," replied Mr. Murdstone; "but he is not generally favorable, I believe."

There was more laughter at this, and Mr. Quinion said he would ring the bell for some sherry in which to drink to Brooks. This he did; and when the wine came, he made me have a little, with a biscuit, and before I drank it, stand up and say, "Confusion to Brooks of Sheffield!" the toast was received with great applause, and such hearty laughter that it made me laugh too; at which they laughed the more. In short, we quite enjoyed ourselves.

We walked about on the cliff after that, and sat on the grass, and looked at things through a telescope—I could make out nothing myself when it was put to my eye, but I pretended I could—and then we went back to the hotel to an early dinner. All the time we were out, the two gentlemen smoked incessantly—which, I thought, if I might judge from the smell of their rough coats, they must have been doing, ever since the coats had first come home from the tailor's. I must not forget that we went on board the yacht, where they all three descended into the cabin, and were busy with some papers. I saw them quite hard at work, when I looked down through the open skylight. They left me, during this time, with a very nice man, with a very large head of red hair and a very small shiny hat upon it, who had got a cross-barred shirt or waistcoat on, with "Skylark" in capital letters across the chest. I thought it was his name; and that he lived on board ship and hadn't a street-door to put his name on, he put it there instead; but when I called him Mr. Skylark, he said it meant the vessel.

I observed all day that Mr. Murdstone was graver and steadier than the two gentlemen. They were very gay and careless. They joked freely with one another, but seldom with him. It appeared to me that he was more clever and cold than they were, and that they regarded him with something of my own feeling. I remarked that, once or twice, when Mr. Quinion was talking, he looked at Mr. Murdstone sideways, as if to make sure of his not being displeased; and that once when Mr. Passnidge (the other gentleman) was in high spirits, he trod upon his foot, and gave him a secret caution with his eyes, to observe Mr. Murdstone, who was sitting stern and silent. Nor do I recollect that Mr. Murdstone laughed at all that day, except at the Sheffield joke—and that, by the by, was his own.

We went home early in the evening. It was a very fine evening, and my mother and he had another stroll by the sweetbriar, while I was sent in to get my tea. When he was gone, my mother asked me all about the day I had had, and what they had said and done. I mentioned what they had said about her, and she laughed, and told me they were impudent fellows who talked nonsense—but I knew it pleased her. I knew it quite as well as I know it now. I took the opportunity of asking if she was at all acquainted with Mr. Brooks of Sheffield,-but she answered no, only she supposed he must be a manufacturer in the knife and fork way.

Can I say of her face—altered as I have reason to remember it, perished as I know it is—that it is gone, when here it comes before me at this instant, as distinct as any face that I may choose to look on in a crowded street? Can I say of her innocent and girlish beauty, that it faded, and was no more, when its breath falls on my cheek now, as it fell that night? Can I say she ever changed, when my remembrance brings her back to life, thus only; and, truer to its loving youth that I have been, or man ever is, still holds fast what it cherished then?

I write of her just as she was when I had gone to bed after this talk, and she came to bid me good night. She kneeled down playfully by the side of the bed, and laying her chin on her hands, and laughing, said:

"What was it they said, Davy? Tell me again. I can't believe it."

"Bewitching—" I began.

My mother put her hands upon my lips to stop me.

"It was never bewitching," she said, laughing. "It never could have been bewitching, Davy. Now I know it wasn't!"

"Yes it was. Bewitching Mrs. Copperfield," I repeated stoutly. "And pretty."

"No, no, it was never pretty. Not

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

pretty," interposed my mother, laying her fingers on my lips again.

"Yes it was. Pretty little widow."

"What foolish, impudent creatures!" cried my mother, laughing adventurous proposition that I am about to mention; but it was probably about two months afterwards.

We were sitting as before, one evening (when my mother was out as before), in company with the stocking and the yard measure, and the bit of wax, and the box with St. Paul's on the lid, and the crocodile book, when Peggotty, after looking at me several times, and opening her mouth as if she were going to speak, without doing it—which I thought was merely gaping, or I should have been rather alarmed—said coaxingly:

"Master Davy, how should you like to go along with me and spend a fortnight at my brother's at Yarmouth? Wouldn't that be a treat?"

"Is your brother an agreeable man, Peggotty?" I inquired provisionally.

"Oh, what an agreeable man he is!" cried Peggotty, holding up her hands. "Then there's the sea; and the boats and ships; and the fishermen; and the beach; and Am to play with—"

Peggotty meant her nephew Ham, mentioned in my first chapter; but she spoke of him as a morsel of English Grammar.

I was flushed by her summary of delights, and replied that it would indeed be a treat, but what would my mother say?

"Why then I'll as good as bet a guinea," said Peggotty, intent upon my face, "that she'll let us go. I'll ask her, if you like, as soon as ever she comes home. There now!"

"But what's she to do while we are away?" said I, putting my small elbows on the table to argue the point. "She can't live by herself."

If Peggotty were looking for a hole, all of a sudden, in the heel of that stocking, it must have been a very little one indeed, and not worth darning.

"I say! Peggotty! She can't live by herself, you know."

"Oh bless you!" said Peggotty, you know? She's going to stay for looking at me again at last. "Don't a fortnight with Mrs. Grayper. Mrs. Grayper's going to have a lot of company."

Oh! If that was it, I was quite ready to go. I waited, in the utmost impatience, until my mother came from Mrs. Grayper's (for it was that identical neighbor,) to ascertain if we could get leave to carry out this great idea. Without being nearly so much surprised as I expected, my mother entered into it readily; and it was all arranged that night, and my board and lodging during the visit were to be paid for.

The day soon came for our going. It was such an early day that it came soon, even to me, who was in a fever of expectation, and half afraid that an earthquake or a fiery mountain, or some other great convulsion of nature, might interpose or stop our expedition. We were to go in a carrier's cart, which departed in the morning after breakfast. I would have given any money to have been allowed to wrap myself up over night and sleep in my hat and boots.

It touches me nearly now, although I tell it lightly, to recollect how eager I was to leave my happy home to think how little I suspected what I did leave for ever. I am glad to recollect that when the carrier's cart was at the gate, and my mother stood there kissing me, a grateful fondness for her and the old place I had never turned my back upon before made me cry. I am glad to know that my mother cried too, and that I felt her heart beat against mine.

I am glad to recollect that when the carrier began to move, my mother ran out at the gate, and called to him to stop, that she might kiss me once more. I am glad to dwell upon the earnestness and love with which she lifted up her face to mine, and did so.

As we left her standing in the road, Mr. Murdstone came up to where she was, and seemed to expostulate with her for being so moved. I was looking back round the awning of the cart, and wondered what business it was of his. Peggotty, who was looking back on the other side, seemed anything but satisfied; as the face she brought back in the cart donated.

I sat looking at Peggotty for some time, in a reverie on this stupendous case; whether, if she were employed to lose me like the boy in the fairy tale, I should be able to track my way back home again by the buttons she would shed.

CHAPTER III.

I have a change.

The carrier's horse was the laziest horse in the world, I should hope, and shuffled along, with his head down, as if he liked to keep people waiting to whom the packages were directed. I fancied, indeed, that he sometimes chuckled audibly over this reflection, but the carrier said he was only troubled with a cough.

The carrier had a way of keeping his head down, like the horse, and of dropping sleepily forward as he drove, with one of his arms on each of his knees. I say "drove," but it struck me that the cart would have gone to Yarmouth quite as well without him, for the horse did all that; and as to conversation, he had no idea of it but whistling.

Peggotty had a basket of refreshments on her knee, which would have lasted us out handsomely, if we had been going to London by the same conveyance. We ate a good deal, and slept a good deal. Peggotty always went to sleep with her chin upon the handle of her basket, her hold of which never relaxed, and I could not have believed unless I had heard her do it, that one defenceless woman could have snored so much.

We made so many deviations up and down lanes, and were such a long time delivering a bedstead at a public house, and calling at other places, that I was quite tired and very glad, when we saw Yarmouth. It looked rather spongy and soppy, I thought, as I carried my eye over the great dull waste that lay across the river; and I could not help wondering, if the world were really as round as my geography-book said, how any part of it came to be so flat. But I reflected that Yarmouth might be situated at one of the poles; which would account for it.

As we drew a little nearer, and saw the whole adjacent prospect lying a straight low line under the sky, I hinted to Peggotty that a mound or so might have improved it; and also that if the land had been a little more separated from the sea, and the town and the tide had not been quite so mixed up, like toast and water, it would have been nicer. But Peggotty said, with greater emphasis than usual, that we must take things as we found them, and that, for her part, she was proud to call herself a Yarmouth Bloater.

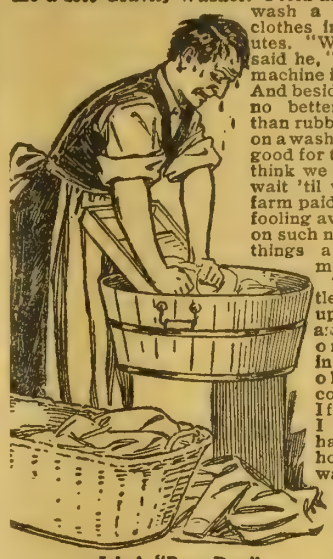
When we got into the street (which was strange enough to me), and smelt the fish, and pitch, and oakum, and tar, and saw the sailors walking about, and the carts jingling up and down over the stones, I felt that I

He Bought Her a 1900 Washer

ONE OF OUR READERS TELLS HOW HER HUSBAND LEARNED

What Washday Means to a Woman

DEAR EDITOR:—Most men have no realization of what "wash-day" means to a woman. My husband is one of the best men that ever lived, but he laughed when I asked him one day to get me a 1900 Gravity Washer. I told him it would wash a tubful of clothes in six minutes. "Why, wife," said he, "a washing machine is a luxury. And besides, there's no better exercise than rubbing clothes on a washboard. It's good for the back. I think we had better wait 'til we get the farm paid for before fooling away money on such new-fangled things as washing machines."



John's "Busy Day"

That settled it. I gave up the idea and kept right on washing in the same old way. I confess that I felt hurt, but I knew John had no notion how hard it was to do the washing for a family of five—three of them little tots. I am not very strong, and the washing, with all my other work, finally got the better of me. I had quite a sick spell, and after things had gone at sixes and sevens for nearly two weeks, I suggested to John that he had better do the washing. We couldn't hire a girl for love or money, and the situation was desperate.

So one morning he started it. My, what a commotion there was in the kitchen! From my bedroom I occasionally caught glimpses of poor John struggling with that mountain of dirty clothes.

If ever a man had all the "exercise" he wanted, my husband was that man! Couldn't help feeling sorry for him, and yet it made me laugh, for I remembered how he made fun of me when I hinted so strongly for a 1900 Gravity Washer. When he finally got the clothes done and on the line, he was just about "all in."

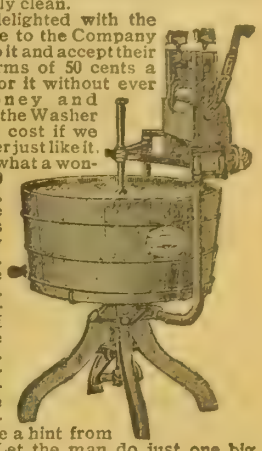
That evening John came to my room, and said kind of sheepishly—"What's the name of the firm that makes those washers you were telling me about?" I looked up their advertisement and found the following address:

G. V. MORRIS Manager
The 1900 Washer Co.,
357 Yonge St., Toronto, Can.

That's all he said, but he lost no time in sending for their Free Washer Book. The book came in due time and with it an offer to send the 1900 Gravity Washer on thirty days' free trial. My husband jumped at the chance to try the Washer without having to spend a cent. "We'll have four weeks' use of the Washer anyway, even if we don't decide to keep it," he said! So he told the Company to send on the Washer.

It was sent promptly, all charges paid, and the 1900 Washer Company offered to let us pay for it in little easy payments. The next week I felt well enough to use it. It is the nicest Washer I ever saw, and it almost runs itself. Takes only six minutes to wash a tubful, and the garments come out spotlessly clean.

We were all delighted with the Washer, and wrote to the Company that we would keep it and accept their easy payment terms of 50 cents a week. We paid for it without ever missing the money and wouldn't part with the Washer for five times its cost if we couldn't get another just like it.



If women knew what a wonderful help the 1900 Gravity Washer is, not one would be without it. It saves work and worry and doctor's bills. Takes away all the dread of wash-day. I feel like a different woman since I have quit the use of the washboard. And if any woman's husband objects to buying one of these labor-saving machines, take a hint from my experience. Let the man do just one big washing by hand-rubbing on the old-fashioned washboard, and he will be only too glad to get you a 1900 Gravity Washer.

Anybody can get one on free trial, by first writing for the Washer Book.

Excuse me for writing such a long letter, but I hope, Mr. Editor, you will print it for the benefit of the women readers of your valuable paper.

Sincerely yours, MRS. J. H. SMITH.

A Range should be a permanent investment and guaranteed as such. The "Pandora" is fearlessly guaranteed by dealers as well as by the makers, simply because they know that it will give utter satisfaction. Can you wonder that so many people buy

had done so busy a place an injustice; and said as much to Peggotty, who heard my expressions of delight with great complacency, and told me it was well known (I suppose to those who had the good fortune to be born Bloaters) that Yarmouth was, upon the whole, the finest place in the unioerse.

"Here's my Am!" screamed Peggotty, "growed out of knowledge!"

He was waiting for us, in fact, at the public-house; and asked me how I found myself, like an old acquaintance. I did not feel, at first, that I knew him as well as he knew me, because he had never come into our house since the night I was born, and naturally he had the advantage of me. But our intimacy was much advanced by his taking me on his back to carry me home. He was now, a huge, strong fellow of six feet high, broad in proportion, and round shouldered; but with a simpering boy's face and curly light hair that gave him quite a sheepish look. He was dressed in a canvass jacket, and a pair of such very stiff trousers that they would have stood quite as well alone, without any legs in them. And you couldn't so properly have said he wore a hat, as that he was covered in a top, like an old building, with something pitchy.

Ham carrying me on his back and a small box of ours under his arm, and Peggotty carrying another small box of ours, we turned down lanes bestrewn with bits of chips, and little hillocks of sand, and went past gasworks, rope-walks, boat-builders' yards, ship-wrights' yards, ship-breakers' yards, caulkers' yards, figgers' lofts, smiths' forges, and a great litter of such places, until we came out upon the dull waste I had already seen at a distance; when Ham said,

"Yon's our house Mas'r Davy!"

I looked in all directions, as far as I could stare over the wilderness, and away at the sea, and away at the river, but no house could I make out. There was a black barge, or some other superannuated boat, not far off. high and dry on the ground, with an iron funnel sticking out of it for a chimney and smoking very cosily; but nothing else in the way of a habitation that was visible to me.

"That's not it," said I. "That ship-looking thing?"

"That's it, Mas'r Davy," returned Ham.

If it had been Aladdin's palace, roc's egg and all, I suppose I could not have been more charmed with the romantic idea of living in it. There was a delightful door cut in the side, and it was roofed in, and there were little windows in it, but the wonderful charm of it was, that it was a real boat which had no doubt been upon the water hundreds of times, and which had never been intended to be lived in, on dry land. That was the captivation of it to me. If it had ever been meant to be lived in, I might have thought it small, or inconvenient, or lonely; but never having been designed for any such use, it became a perfect abode.

It was beautifully clean inside, and as tidy as possible. There was a table, and a Dutch clock, and a chest of drawers, and on the chest of drawers there was a tea-tray with a painting on it of a lady with a parasol, taking a walk with a military-looking child who was trundling a hoop. The tray was kept from tumbling down by a bible; and the tray, if it had tumbled down, would have smashed a quantity of cups and saucers and a teapot that were grouped around the book. On the walls there were some common colored pictures, framed and glazed, of scripture subjects; such as I have never seen since in the hands of peddlers, without seeing the whole interior of Peggotty's brother's house again, at one view. Abraham in red going to sacrifice Isaac in blue, and Daniel in yellow cast into a den of green lions, were the most prominent of these. Over the little mantle-shelf, was a picture of the Sarah Jane lugger, built at Sunderland; with a real little wooden stern stuck on it; a work of art, combining composition with carpentry, which I considered to be one of the most enviable possessions that the world could afford. There were some hooks in the beams of the ceiling, the use of which I did not divine then; and some lockers and boxes and conveniences of that sort, which served for seats and eked out the the chairs.

(Continued in next issue)

Flour and Breadmaking.

(Continued from last issue)

METHODS OF MAKING BREAD.

There are various methods of making bread in the home. A few of the methods and their uses are discussed below.

1. The ferment, sponge and dough method is one of the most common methods in use, consisting of a ferment, sponge and dough stage. (a) Ferment: A thin batter made up of potato or plain water, a little sugar and enough flour to make a pour batter, placed in a temperature of from 70 to 80 debrees F., until it is light and spongy. This method is best suited to the use of dry compressed yeast, which is in a dry dormant state, and needs the food, moisture, and warmth to bring it into a healthy, vigorous ferment. (b) Sponge: At the stage the sugar, salt, shortening and sufficient liquid to make the desired amount of bread is added to the ferment, and flour added to make a thick batter, and this sponge is allowed to rise from 8 to 10 hours. (c) Dough. The dough is then added by the addition of all the flour needed to make the mass of the desired consistency.

2. Sponge and dough, probably the most widely used in the home, and the best adapted to the uses of the soft and hard flours. Sponge may be made with hard Manitoba flour and fermented from 6 to 10 hours. The hard flours take a much longer time to ripen, hence the reason for giving them the longer time in the sponge. Potato water and a little mashed potato improves this sponge. This is a desirable method where the home-made yeast is used, or the moist compressed yeast. The dough is made from this sponge with either hard or soft flour, either giving good results when properly used. The soft flour gives a loaf of very close texture, but a characteristic sweet flavour that is very much liked by some people, and can only be obtained when Ontario winter wheat flour is used.

3. Offhand dough is that method in which the dough is made direct without any preceding stages of ferment and sponge, and it is the best method to use when it is desirable to make bread in a short time. Because of the short fermentation period, it is necessary to use a much

Replace Your Out-of-doors Closet

WITH A TWEED SANITARY CLOSET and get rid of the thousand and one dangers and troubles of the old fashioned out-house.

The "Tweed" Closet is easily installed indoors and requires no sewer, no plumbing and no flushing system.

"TWEED" CLOSET
Sanitary and Odorless

can be placed in the cellar or in any suitable room in the house.

The use of the "Tweed" Chemical—a liquid disinfectant and deordorizer—keeps the closet absolutely odorless. For ventilation the "Tweed" is connected by a pipe to a chimney hole or stove pipe.

The "Tweed" Closet was awarded a Diploma at Ottawa Exhibition 1911.

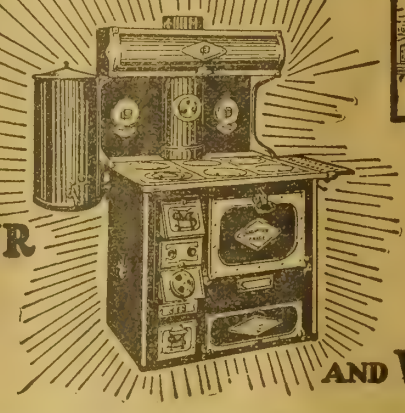
DIRECT FROM FACTORY TO KITCHEN

SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.



$41.00 TO $49.00

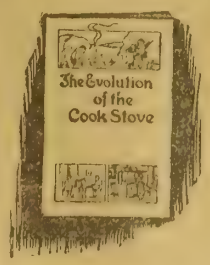
AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price

Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of tough, strong, malleable iron and the best blue polished steel—materials which will not warp, crack or break.

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it saves over 30% of fuel, burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41, or to any station in the four Western Provinces for $49—$5 to be sent with order and balance to be paid when the Range is delivered at your station. If not convenient to pay cash we will arrange to accept your note.

When writing it will be a distinct favor to us if you will mention this paper. 7

Try this Thirsty Flour

A *very* thirsty flour. Absorbs a lot of water.
Because it contains so much *gluten.*
Manitoba wheat is wonderfully rich in *sturdy* gluten.
And, think of it, FIVE ROSES is milled *exclusively* from the very *cream* of the Manitoba wheat berries.
So FIVE ROSES must be awfully thirsty, don't you see.
In your mixing bowl it greedily absorbs *more* water.
So you get *more* loaves than usual without using more flour. You use *less.*
Your flour lasts *longer,* doesn't it?
Less trips to your dealer.
That's how FIVE ROSES saves money.
Actually saves YOU money.
Use this *economical* flour.

Five Roses Flour

Not Bleached — LAKE OF THE WOODS MILLING COMPANY LIMITED KEEWATIN TRADE MARK REGISTERED — Not Blended

LAKE OF THE WOODS MILLING COMPANY, LIMITED MONTREAL

larger amount of yeast in proportion to the amount of liquid, and flavour must to some extent be sacrificed, but, if rightly manipulated, this method makes very nice bread and one in which a good grade of soft flour may be used. It is also a good method to follow in winter when there is no means of controlling temperature. The following recipes, typical of each process, are used in our flour testing laboratories with satisfactory results.

The beginner is advised to start with the first method and become thoroughly familiar with its successful use before proceeding to the others. She is also urged to use a thermometer in order to become sensitive to correct temperature as soon as possible. After these typical recipes are followed the beginner should be able to follow the variations of any good cook book.

The following are the detailed directions for making bread by each of the above methods. When the recipe does not provide sufficient materials to make the desired quantity of bread, the amount of the various ingredients may be halved, doubled or portion remains the same.

1. FERMENT, SPONGE AND DOUGH METHOD.

1 dry yeast cake.
2 quarts liquid.
2 level tablespoons salt.
2 level tablespoons sugar.
2 level table spoons lard.
Flour.

Preparation of ferment. Put a pint of water at a temperature of about 90 degrees F. into a bowl, drop the dry yeast cake into it and soak for half an hour, then stir in enough flour to make a thin batter, add one tablespoon sugar, and beat with a dover beater until well mixed and full of bubbles. Stand in a temperature of 70 degrees to 80 degrees F. until light, which will take from four to five hours.

Preparation of sponge. When the ferment is ready, put the rest of the sugar, salt and lard into a kneading-pan, bring the rest of the liquid to 90 degrees F. and add it to the ingredients in the pan. Add enough strong flour to make a batter that will beat without spattering; add the ferment and beat until it looks smooth and elastic. This will probable take 15 or 20 minutes. Cover closely, and keep at a temperature of 70 degrees F., until light and spongy. This will take from 9 to 10 hours.

Preparation of dough. When the sponge is ready stir in strong flour until too stiff to use the spoon, then mix in more with a stiff-bladed knife, or the hand, until the dough no longer sticks to the fingers. Turn the dough out on the moulding board to knead, leaving the pan quite clean. The dough should knead without flour being put on the board or hands; if it proves sticky return it to the pan and mix in moreflour, remembering that while too slack a dough makes coarse textured bread, too stiff a dough makes slow-rising bread which will dry out quickly. Knead lightly until the mass is elastic and velvety, the surface covered with a film of tiny bubbles, and cut with a sharp knife shows the inside full of fine even bubbles and free from lumps or unmixed portions. Grease the kneading-pan lightly with lard, warm both pan and cover if they are cold, put in the dough, cover closely, and keep at a temperature of 80 degrees F. until rather more than doubled in volume, or until a gentle slap with the tips of the fingers causes it to fall in. This will take from 2 to 3 hours.

Knead lightly in the pan for a minute to get rid of the larger bubbles and return to rise a second time until double in volume. This will take from 1 to 2 hours.

Divide into loaves that will half fill the bread tins. Knead each piece only enough to get rid of large bubbles and smooth the surface, and put it into a greased tin. Keep at a temperature of 70 degrees to 80 degrees F. until doubled in volume, when they should have a bold, nicely rounded appearance.

Bake an hour in an oven about 350 degrees F. When done, the loaves should give a hollow sound when tapped on the bottom.

When baked remove at once from the pan, and stand on edge or across the top of the pans, that the air may get to all parts and cool it quickly.

VARIATIONS.

1. The above calls for strong flour. Soft flour may be used for the dough stage, but must be kneaded down before it has quite doubled in volume each time. It is not advisable to use soft flour for the ferment and sponge stages, as it does not stand the long fermentation.

2. Home-made yeast may be used instead of the dry yeast. Use one cup home-made yeast and only 3½ pints of liquid.

3. The liquid may be part milk (scalded) and part water. The latter may be potato water; i.e., water in which two or three potatoes have been boiled, removed and finely mashed and returned to the liquid.

4. The potato water may form the liquid for the ferment stage, and the mashed potatoes added when the sponge is made. Potatoes give that silkiness of texture so much desired by good breadmakers.

5. If the dough is kept covered while rising it will not form a crust. If it seems inclined to form a crust, moisten it with warm milk and water. A crust is to be avoided as it makes a streak through the loaf if kneaded in at the early stage, and an unsightly crust on the baked loaf if allowed to form in the last stages.

6. The second rising of the dough may be omitted, although the extra rising makes the loaf a rather finer texture.

7. The bread-mixer may be used to knead the dough after it is known exactly how much flour the liquid will need to make dough of the right stiffness.

Questions Re Alfalfa.

Editor Maritime Farmer:—

Kindly answer a few questions, in regard to Alfalfa, through your valuable paper. I have a small patch which was sown late in the summer, and notwithstanding the dry weather it has grown fairly well. Would it be advisable to cut it or let it die down? Should I cover it over like strawberries for the winter, and, if so, what would be the most suitable covering.

It is from sample seed which was advertised through your paper.—J. G. Reed, Sumb. Co., N. S.

Ans.—1. It would be unwise to cut it at this late date in the season. Even a luxuriant growth will be sufficiently wilted by the frosts of an average fall to prevent any smothering of the roots.

2. Only experimentally would we advise any covering for winter protection. A plant for forage purposes that needs such treatment is not practical. We noticed where some covering had been applied last winter that there was a greater percentage of plants killed. The character of the winter will have a great deal to do with it. In the case noted last winter the snow covering was thin and during the thaw periods the straw covering became filled with ice; obviously this was the cause of the smothering. Try a liberal and uniform dressing of manure on a section of the patch.

By all means treat sections of your patch differently. It is wonderful what ideas a farmer can glean from sound experimental work under his own conditions.—C. W. McD.

Alfalfa Gives Bright Yolks.

It has often been noticed by poultrymen that the yolks of eggs laid during the winter months are not as well colored as those laid in summer.

It was believed by some that this was due to a lack of green food, and in order to test the correctness of this belief, a series of experiments were carried on at the Utah Experiment Station by Prof. James Dryden, now of the Oregon Agricultural College, during the winter of 1904. The fowls in the test were divided into a number of different pens, being fed several different rations, some with corn as the principal grain, and others with wheat as the main part of the ration, but all being fed sugar-beets as a source of green food. The corn fed was a mixture of white and yellow, the white predominating, but did not seem to affect the color of the yolk, as all the pens at the beginning of the experiment were laying eggs with pale yolks.

Gradually dry alfalfa leaves were added to the food of several of the pens in addition to the ration they were already getting, including the sugar beets. Two weeks after the alfalfa was first fed, a test for color was made, and the yolks from the alfalfa-fed pens were found to have a uniformly rich color, while those from the other pens, which were fed no alfalfa, continued to be very pale in color. One pen was fed skim milk in place of meat-scraps, but this did not seem to affect the color of the yolk. The results of this test show that it is not merely a matter of having plenty of green food, but of having plenty of the right kind of green feed, if a bright colored yolk is desired.

When you have a cold you want the best medicine obtainable so as to cure it with as little delay as possible, Here is a druggist's opinion. "I have sold Chamberlain's Cough Remedy for fifteen years," says Enos Lollar, of Saratoga, Ind., "and consider it the best on the market." For sale by all dealers.

For New Vitality Send Me The FREE COUPON

There is to-day no excuse for any man remaining weak. The vital, manly man is admired by all men as well as all women; there is an influence about him no one can resist; he knows no fear; he knows no weakness; he knows no result of debility. It is this same VITALITY which carries our young soldiers to war without thought of death. Vitality, reader, is what you MUST have if you would enjoy a life of health, strength and manly vigor. I can give you this same life and vitality; if I can do for you what I am doing for thousands of others I can put the vigor of youth into your blood and nerves; I can make you feel young again and keep you feeling young; I can drive away all dibility, weakness and despondency. You will laugh at trouble, you will tackle obstacles with the vim to win, just as all other hearty vital men may do. I don't ask you to use drugs. I ask no change in your present mode of living; just cease all dissipation and then use my HEALTH BELT. All else will come. My Health Belt with suspensory attachment is the greatest nature cure and VITALITY supply that the world has ever known or probably ever will know. Nothing is taken for granted: you feel better immediately, at once, from the first time used. Worn all night, while you sleep, it pours a great stream of Vitality and energy into your weakened system: it is a wonder-working giant of power; made as I now make it, I am getting results of which no man ever dreamed. Just think, over ten thousand men applied to me during the month of February. I am now sending great shipments of my Health Belt to every part of the civilized world. There is a reason, I am curing; I am giving men back their lost strength. It makes you feel ambitious, full of vim; you awaken mornings sparkling with bright, clear-eyed, clear-brained health; the weakness has all disappeared from your back; you are "just feeling fine." Special attachments to my Health Belt cure rheumatism, kidney, liver and stomach trouble.

Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man, young or old, who would be strong in manly vigor. It is a word of hope, a carefully written, interesting booklet, which should be in everyone's possession. Therefore, send to-day. If in or near the city, call at my office.

Truss Torture

Once Thought Necessary, but Now Your Search for Relief Is Ended.

Wonderful Method Retains Rupture Without Knife, Danger or Pain.

J. Y. EGAN, Specialist of Toronto

Old-fashioned truss torture is no longer necessary. Galling, slipping trusses and barbarous methods of treating rupture are done away with by the wonderful invention of a specialist who has devoted fifty years to this one affliction. The marvelous new EGAN "CURATRUS" gives to the ruptured instant relief, rest and security where all others fail. It stops all irritation and restores every part to its natural position as soon as it is used and for all time and old style trusses are thrown away.

"EGAN'S CURATRUS" cures are absolutely without operation and the cost is small.

Multitudes of cured men, women and children testify. Also endorsed by many physicians.

Where others fail is where I have my greatest success. Nothing complicated, no pain or irritation, but just a natural retentive method.

Immediate relief guaranteed. No fakes or lies —just straight business. Do not lay this aside, or delay, but tear off free coupon now.

Free Consultation Coupon.

This coupon, upon presentation to J. Y. Egan, rupture specialist, 331 West King Street, Toronto, who will visit the towns (on dates mentioned below) will entitle bearer to free consultation and examination of samples. Ask at hotel office for number of my room. Note dates.

How to Destroy Them.

The common little red ant, which makes tiny hills on our walks and in the grass, can be hestroyed by pouring a little gasoline in each hole. Half a teacupful to a teacupful will suffice for from three to six hills. Do not be afraid to use plenty of gasoline, in order to reach the queen or queens which lay the eggs. This liquid, however, will kill grass or plants where it comes in direct contact with them.

The large mounds out of doors, each of which is occupied by hundreds of ants can be easily treated with bisulphide of carbon. Make eight or ten holes with a cane or croquet stick, about eight inches deep, in each mound. Into each hole pour a good tablespoonful of bisulphide of carbon, closing each hole with earth, and then throw a couple of wet burlap sacks over the hills, leaving them over night. One might have to do this twice, or until the queens are killed.

While ants, when seen climbing up apple trees, or shrubbery and plants, generally do not directly injure the plants, since they are for the most part alter the lice, which give up to them in response to their caresses, some honey dew, of which ants are very fond; nevertheless the black ant sometimes girdles and kills shrubs like the lilac and snowball. When ants are found at this work, we first have recourse to strong tobacco water to see whether we can drive them away. If they still persist in eating the bark, we advise uncovering the crown and larger roots, mixing up arsenate of lead with a little water, and applying it as thick whitewash to these parts. Arsenate of lead is a poison, which, however, applied in that way, would not injure the bush.

Should Turnip Leaves be Left in Field.

Practice differs in regard to the utilisation of the turnip leaves. Some farmers leave them in the field, and plough them in for the benefit of the following crop; others, and probably by far the larger number, carry them off with the bulbs to be used as food for cattle. The latter, perhaps, is the easiest way, but an important question is: Which method is the more profitable?

A 17 ton crop of turnips contains in its leaves 50 lb. of nitrogen, 5 lb. of phosphorus (equal to 25 lb. phosphateof lime), and 33 lb. of potassium, which would be equal to £1 13s. 6d. value in artificial manure.

To test the actual manurial value of turnip leaves, twenty plots were set aside, ten of these having the leaves carried off, while in the other ten plots the leaves were left on the ground. These plots were sown with oats, and, during growth, the difference in favor of leaving the leaves on the ground was very evident.

Ten different trials were made of each system, beacuse the previous manuring had not been quite identical, and this probably accounts for the increases not being uniform, but the general increase is quite obvious, amounting on the average, to 19 cwt. straw and 2 qr. extra grain.

The weight of leaves of a 17-ton crop is about 3 tons per acre. It is difficult to place a value on unmarketable, hall-decaying material, but, putting turnips at 8s, per ton, it would not be an over estimate to put the leaves at 4s per ton. Even, however, at this high price the leavers of the 17-ton crop would have a value of only 12s. for leeding purposes, but for manurial purposes, as has been mentioned, its value, as compared with the same contents in artificial manure, is £1 13s. 6d.; while the value of the increase of crop, putting

Professor H. H. Dean Prepares a Course On "Dairying"

HERE is a Course of Education that will appeal to every progressive farmer. It is the experience and knowledge of the most successful dairymen in various parts of the world put into such a clear and simple form that it may be readily understood and applied with profit by Canadian farmers.

This course is the crowning achievement of Professor Dean's life —the result of twenty-two years' experience as a teacher, scientist, investigator and practical dairyman. Prof. Dean is one of the most eminent dairy professors in the world, being professor of dairying at Ontario Agricultural College, Guelph.

World's Leading Dairy Farms Visited

Much of the material for the course was gathered from visits to the leading dairy farms of the world in England, Scotland, Holland, and the islands of Guernsey and Jersey. There is but one other way to obtain this information. That is, to go abroad yourself and visit these model dairy farms. It would be well worth your while, too, but it would cost you a thousand dollars or more.

Among other things, this course explains the marvelously efficient methods pursued by the "Model Farm" of North Holland where the finest Holsteins are kept.

Two Breeding Systems

This course on "Dairying" also tells about two widely different, yet successful, systems of breeding for milk-producing cows as followed on two Guernsey farms for over forty years. Canadian dairymen should certainly have this information.

But to go into full particulars about this course is impossible in this space. To state the matter briefly, it covers almost everything from the origin and development of dairy cattle and the various breeds to modern dairy stock management. The subjects of "Feeding" and "Breeding" are alone worth many dollars to the man who will apply what he learns.

5-Year Subscriptions Free

The Course aims to meet two classes of readers: *First*—Those who are interested in dairying, but who do not care to answer the examination questions. *Second*—Those who will write on the examination questions at the close of the course. Five year subscriptions to "Canadian Farm" will be given free to the subscriber residing in the Maritime Provinces who makes the highest marks, to the one residing in Ontario and Quebec, and to the one residing in the Western Provinces. You have as good a chance as anyone to win a five years' subscription.

This course is a gift that the Publishers of "Canadian Farm" are making to their subscribers. It cost considerable, more than you imagine, to secure the rights to print this notable series of articles in "Canadian Farm." It is the biggest thing that any agricultural publication has ever pulled off.

Each week for ten weeks, this series of articles will be continued in "Canadian Farm." Each article will be well illustrated and intensely interesting.

Can You Answer These?

Just as an experiment see if you can answer the following questions. Then you will have some idea as to whether there is anything in the course for you to learn.

1. What is the general outlook for immediate improvement in dairy cattle in Canada?
2. What are the three main theories relating to origin of species?
3. What is the limit of milk production in a dairy cow?
4. What are the strong and weak points of the Ayrshire breed? The Jersey? The Holstein?
5. What is the reason for the high percentage of butter fat in Jerseys' milk?
6. What is the "upward principle" in breeding? (This principle is more important than heredity.)
7. Why is it important to look out for "sports" and "mutants" among cows? How would you discover them, there being no noticeable difference in appearance?
8. What is Nutritive Ratio? Why is it so vastly important for dairying purposes? What are the German, American and O.A.C. Tables of Nutritive Ratio?
9. What is a correct balanced ration for a cow giving 60 lbs. of milk daily?
10. What do the terms "Record of Performance" and "Record of Merit" mean as applied to dairy cattle?
11. What is one satisfactory system of ventilating a dairy?

You will be able to answer these questions and scores of others when you've completed the course—read the series of articles faithfully. Just think how largely you will increase your knowledge. Knowledge is power—power to make larger profits.

Mail the Coupon

Fill in coupon below. Enclose with it 25c. for a three months' subscription, or $1 for a year's subscription. You will receive the entire series of articles in the three months' subscription.

Other notable articles of interest to progressive farmers will also appear in "Canadian Farm" during the next twelve months. After you've read a couple of issues of this bright, newsy, informative publication you'll quickly decide to take it permanently.

But the main thing is to send the coupon in right now, so as to get the "Dairying Course" right from the start. Address the envelope to

straw at 40s. her ton and grain at 16s. per qr., is; Straw, £1 18s.; and grain, £1 12s. Total, £3 10.

It thus appears evident that it is much more profitable to leave the leaves on the ground than to cart them home for cattle food.

There is a general complaint of the oat crop after turnips being unsatisfactory. The above results go far to show that this unsatisfactory feature would disappear if the turnip leaves were left on the field, and covered up as early as practicable, and if the soil was not put in a bad mechanical state by carting on it, and working it in a wet condition.—Mark Lane Express.

How Bones are Collected in Arabia.

The advance in the value of bones has caused their collection in out-of-the-way places of the world to be carried on with greater activity. Thus it is reported that the trade in bones from Arabia is increasing. The bones are shipped to Germany, France and England. Some parcels even find their way to America.

The bones collected in the Somali district of Arabia are of two classes. Those gathered from the surface being clean and white, while those dug out of the ground are more or less yellow.

The native Arab traders buy the bones from the poor women of the district, paying about 33s. per English ton, and the bones are then loaded on camels for transport to the nearest place. A camel can carry a load of 336 lbs. The bones are then bought by the merchants who ship them. Merchants have sometimes tried to deal direct with the poor women who collect the bones, but have found it a far more costly system, as the women prefer to deal with the Arab traders, and the traders do not make inquiries as to the origin of the merchandise.

Seed Potato Selection.

Many farmers even yet postpone the selection of their seed potatoes until the time they are wanted for use. Those of the progressive and wide-awake order however, now follow a different plan. It is far better to make the selection at the time of harvesting. Some plants will produce seven or eight good-sized, perfectly formed tubers. Other hills have to show one or two large potatoes, with perhaps eight or ten unsaleable ones. Now if the selection is made from the bins, the good sized potatoes from the latter hills, with their inherent tendency to reproduce many little ones, are as likely to be chosen as the good ones are. It is then obviously better to choose the seed potatoes from the hills at harvesting time. There is no reason why this policy if continued for some years should not result in an average harvest of seven or eight pounds of large well-formed tubers to the hill.

Phosphate of Lime Necessary for Bone Culture.

It may be taken as an axiom that pastures and hay land poor in phosphate of lime cannot support stock in a healthy condition. A striking example of this fact has been supplied by a district in France where the soil was naturally lacking in phosphate. For a long period up to about the year 1880 the cattle in the district of Gaetnais were decimated by bone diseases. Efforts were made to improve their condition by giving them doses of phosphate, powdered bones, and similar materials as a medicine, although without any marked success, and it was not until the use of phosphoric fertilizers became general in the locality that any marked diminution in the disease could be observed.

Before 1880 the cattle, according to records, did not average more than 800 lb. in weight, and furnished only about 3 pints of milk, whereas at the present time the weight of the cattle frequently exceeds 1,000 lbs., and the milk yield has increased to 4¼ pints.

Formerly the cattle presented to the eye an appearance of lassitude and indolence, and the mortality sometimes amounted to 15 per cent. on a farm.

Now their appearance denotes strength and activity, and the mortality has declined to 2 per cent.

These changed conditions are ascribed in the report, from which we have taken the details to the regular application to the pastures and hay lands of phosphoric fertilizers, which have enabled the soil to produce forage more abundant and richer in phosphate of lime.

Get Busy With a Baler

IF you have clover, timothy, prairie grass, or alfalfa, it will pay you to bale it. Loose hay takes barn space. You cannot sell it easily and you cannot ship it at all. It is the hay that is baled which is in demand in the high-priced city markets. This is the hay upon which you make your profits.

The difference between what it costs to bale hay and the increase you get in price per ton, gives you a bigger margin of profit on your work than anything else you do on a farm. You can bale easily from 8 to 16 tons a day and under certain conditions, several tons more. Baled hay can be made as much a big cash crop to you as your wheat, corn, or oats. All you need is the right kind of hay press. There is money in owning an

I H C Hay Press

An I H C pull power press in either one or two-horse style, or an I H C motor press with a 3, 4, or 6-horse power I H C engine, will do the work required on any farm cheaper, quicker, and with less attention than any other hay press so far designed.

It has taken years of field testing to make these presses the best that you can buy. They are that now. The horse power presses have greater capacity than any other horse press of equal size. They are lighter draft and easier on the horses. The step-over is the lowest and narrowest made. They have an adjustable bale tension, which insures compact bales. They are equipped with a roller tucker to turn in all straggling ends, thus making each bale neat in appearance.

I H C motor presses consist of a bale chamber and an I H C engine mounted on substantial trucks. The bale chamber of the motor press corresponds in size to the bale chamber of the horse press—14x18 inches, 16x18 inches, and 17x22 inches. No time is lost in setting up the machine. It can be moved easily from place to place, backed to the stack or barn, and started to work at once. The engine does not need a man to watch it and there is no danger from sparks. When not baling hay, the engine can be detached. Two extra wheels, an axle, and a belt pulley are furnished, so that with a little adjusting, you have a regular portable I H C engine ready for business 365 days each year. You can operate a small thresher or corn shredder, saw wood, shell corn, grind feed, pump water, generate electricity, or run a cream separator. You thus purchase two useful machines in one. There is profit in the hay press and unlimited work in the engine.

Hay time is drawing near. Be prepared for it. Drop in and see an I H C local agent in your town, or write the nearest branch house for a catalogue.

In Handling the Bull.

Do not permit the animal to run with the herd.

Give him plenty of exercise. A yard in which he can move about and a cover under which he can go for shelter is a good plan, arranging this so it will not be necessary to go inside to take care of him.

Do not feed him so he becomes fat, but simply keep him in good physical condition.

Give him feeds that are rather rich in protein, as carbonaceous foods are not conducive to vigor or efficient service.

The tread power is a splendid thing to force a bull to take the exercise needed to keep him in good physical condition.

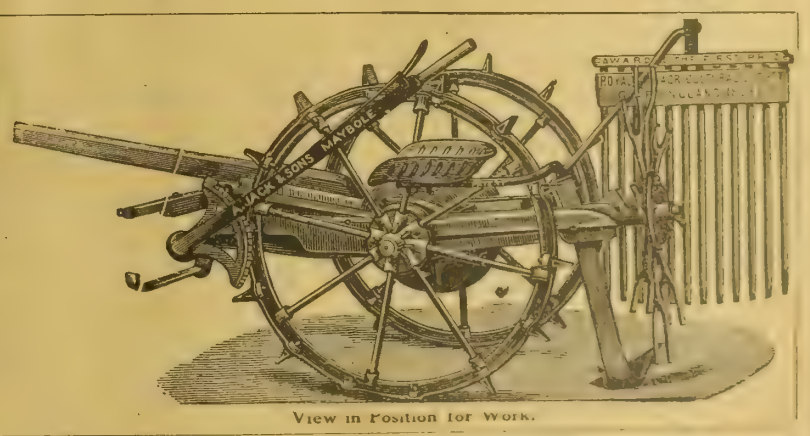
Here is a woman who speaks from personal knowledge and long experience, viz., Mrs. P. H. Brogan, of Wilson, Pa., who says, "I know from experience that Chamberlain's Cough Remedy is superior to any other. For croup there is nothing that excels it." For sale by all dealers.

The World's Best Potato Digger

Jack's Royal First Prize New Patent

CALEDONIAN POTATO DIGGER

Fitted With Ball and Roller Bearings



View in Position for Work.

THE NEW PATENT CALEDONIAN POTATO RAISER holds the record as the Most Perfect Potato Raiser in the World. Awarded the First Prize of £20 at the latest great field trials of THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND, at Leicester, EXCELLING IN ALL POINTS in competition with all the leading manufacturers, and AGAIN AWARDED THE FIRST PRIZE at the NORWEGIAN GOVERNMENT FIELD TRIALS, near Christana (leading Foreign and English Machines competing). WAS TROUBLED WITH HIS HEART

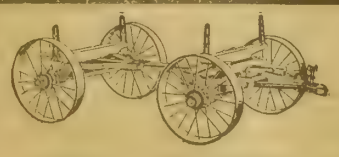
HAD TO GIVE UP WORK

Mr. Alfred Male, Eloida, Ont., writes: "I was troubled with my heart for two or three years. I thought sometimes that I would die. I went to the doctor, and he said he could not do anything for me. I had to give up work. My wife persuaded me to try Milburn's Heart and Nerve Pills. The first box relieved me, so I kept on until I had taken seven boxes, and they cured me. I would not be without them on any account, as they are worth their weight in gold. I advise my friends and neighbors who are troubled with heart or nerve trouble to try them."

To any of those suffering from heart or nerve trouble we can recommend our Milburn's Heart and Nerve Pills with the greatest confidence.

Price 50 cents per box, or 3 boxes for $1.25. If your dealer does not have them in stock, send direct to The T. Milburn Co., Limited, Toronto, Ont.



BUY A WAGON YOU CAN DEPEND ON

For convenience, strength and durability, get a T-A Handy Farm Wagon. Designed especially for farm work, will give everlasting service under the roughest usage to which a wagon can be put. And besides—it is easy on horses.

T-A Handy Farm Wagons and Wide Tire Steel Wheels

Carefully and strongly built of the highest grade material, these T-A Wide-Tire Steel Wheels will carry 25 to 50 per cent. heavier loads without the least danger of breaking down or getting stuck.

We will be pleased to send you descriptive catalogue. Write for it.

The Value of Black Muck on the Farm

The black muck subject has attracted some public attention lately, and different opinions have been expressed as to its value, many of which were mere speculations, and misleading ones at that. Inasmuch as New Brunswick possesses very large quantities of black muck, I ask the privilege, through the columns of The Times, to give the farmers the benefit of twenty years of scientific research and practical experience.

Different mucks vary much in value, especially in the possession of the essential fertilizing elements. That may in part, account for the different opinions of its merits.

The following is the analysis of the deposits on my own place, which I have been experimenting with:

	Per cent.
Nitrogen as ammonia (N.H.3)	—2.03
Organic matter	...73.87

We therefore see that one ton of muck, dry, would contain 40.06 lbs. of ammonia. Its equivalent in nitrogen (available plant food) 33.43 lbs. worth fifteen cents per lb. is tqual to $5.01 per dried ton. About five tons wet would be required to make one ton dry.

The average mucks contain about 75 per cent. water. As the analysis does not show a complete fertilizer, but would require the additions of potash and phospharic acid, to keep up a balanced fertility of the soil, we must account for its good results in another way.

First: The organic matter loosens the soil, puts it in good mechanical condition, enables the moisture to freely circulate and carry food to the plants, and retains moisture in dry sandy soils.

Second: Its use in a dry state in the stable is almost indispensable, for used as bedding and in the trough behind the cattle, it absorbs and retains all the liquid, which is the best part of the manure. This liquid runs to waste in the majority of stables.

In order to better understand its value in this connection, it is necessary to examine the ordinary methods of handling barn manure, and see if the essential elements are finding their way back to the soil, to produce future crops.

LOSSES IN MANURE.

It has been demonstrated by experiments (Bulletin 56, Cornell University Agricultural Experimental Station), that 50 per cent. of the total constituents in farm manures is liable to lost by ill-regulated fermentation and leaching.

It is estimated that if but one-tenth of the present waste could be avoided the total amount of constituents that may thus be saved, would be more than equivalent to the amounts now purchased in the form of commercial fertilizers. Farmers, wake up, and stop the leaks.

I have proved to my satisfaction that not only 10 per cent, but 90 per cent. of the waste occurring in this way may be avoided by the use of black muck and a little land plaster.

No crop will grow without nitrogen, and it is the most expensive fertilizer we buy. We are told that 80 per cent. of the air is nitrogen, but not available to all crops. Crops are divided into two classes, called nitrogen collectors and nitrogen consumers. The latter class must take it from the ground by the roots or starve. The former collects it from the air and stores it in the ground to feed the latter. Clover is one of the principal collectors, and wherever muck is used we get clover.

It is estimated that there is $10,000,000 worth of nitrogen over every acre of land; this is collectable by clover and we are thus able to get the most expensive plant food free.

I think it should be clear to any man that black muck is one of New Brunswick's greatest assets. Even the mucks contain no direct plant foods are available as absorbents and for their physical effect upon the soil.

Lime is not a plant food, yet we get wonderful effects by its use on damp acid soil. Anything that will improve the physical condition of the soil and produce better crops is valuable.—D. MacDougall.

Gas engine "ignition" is the production at the proper instant within the engine cylinder, of an electric spark whereby the charge is ignited. Without good ignition the best engine will not run satisfactorily.

Batteries are commonly used for producing the spark. These wear out in time and require renewal. When the engine begins to miss, and there is plenty of fuel and oil, it is reasonable to suspect the ignition and the batteries should be the first thing examined.

The latest types of engines have built-in engine timed magnetoes, and batteries are unnecessary, the care and expense incidental to their upkeep is being eliminated, as the magneto is an actual part of the engine that furnishes current as long as the engine runs. So the engine furnishes its own electricity and the magneto wears as long as the engine.

As a comparison of the cost of doing work by mechanical and animal power, it is estimated that on the basis of one cent per kilowatt hour, and the use of 10 horsepower hours to plow one acre, the fuel cost for the mechanical power is under 20c. while the cost of the equivalent horse power would be $1.00.

Magneto ignition instead of the troublesome battery, has removed the last objection to the use of the gas engine on the farm.

The "MONARCH" Does all the Hard Work on Your Farm

Why not Get One This Fall?

THE easily-moved "Monarch" will do your farm chores—give you an easier winter than you ever enjoyed. Get one, like thousands of live, economical, wise farmers. All sizes from 1 1-2 to 35 horse power.

This is the "King of Farm Engines" for economy and long wear. Easy to start even at 30 below zero. Made with gasoline gauge, speed regulator, etc., like automobile engines. Just learn how good it is. Water-cooled and air-cooled types. Send for catalogue and folder.

Confederation Life Building, Toronto, Canada.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and **I** will send you the treatment for your case, entirely free, in plain wrapper, by return mail. **I** will also send you **free of cost**, my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** of **Daughters, I** will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, **I** can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - WINDSOR, Ont.

The Cape Breton Island Exhibition.

(Continued from page 7.)

Guernseys.—The vicinity of the Sydneys is becoming a veritable hot bed for Guernseys and some fine individuals were found in the ring.

Bull, 3 years old and over.—1, Little Bras D'or Agricultural Society; 2, Georges River Agricultural Society; 3, Murdo McKenzie, Coxheath.

Bull, 2 years old.—1, G. O. Purves, North Sydney.

Bull, senior calf.—1, R. M, Jackson, Jacksonville.

Bull, junior calf.—1, Murdo McKenzie; 2, R. M. Jackson.

Cow, over 3 years and under 4 years—1, Murdo McKenzie; 2, R. M. Jackson.

Heifer, 2 years old.—1, E. J. Johnston, George's River; 2, R. M. Jackson.

Heifer, over 1 year.—1, R. M. Jackson.

Heifer, senior calf.—1, E. J. Johnston.

Best bull, any age, Cape Breton County.—1, Little Bras D'or Agricultural Society.

The Grade Classes had strong competition in every section. Jersey Grades and Guernsey Grades competing in one class and Ayrshire Grades and Holstein Grades in another class. The number included some useful, milky looking cows and promising young heifers. The best grade herd, Victoria County, was shown by J. C. McDonald, while D. R. Nicholson's grade Holsteins was the best Cape Breton County grade herd. Nicholson also captured the Cape Breton County prize for best herd of grade heifers, under 3 years, bred and owned by exhibitor.

A. K. Jackson and H. A. Moffat had the second and third prize herds of grade cows, while similar honors on herd of heifers, bred by exhibitor went to E. J. Johnston and H. A. Moffat. Nicholson had the best grade cow, any age, as well as the best purebred cow, any age or breed.

Following is a list of awards in the Grade Classes:

GRADE JERSEYS AND GUERNSEYS.

Cow, 4 years old and upwards—1, D. R. Nicholson; 2 and 6, Ira Hughes; 3, A. K. Jackson; 4, H. A. Moffat; 5, E. J. Johnson; 7, Duncan McLeod, 8, Dan McRae.

Dry Cow, 4 years and upwards—1, Ira Hughes; 2, M. R. Gillis; 3, A. K. Jackson; 4 and 5, Murdo McKenzie.

Cow, 3 years old—1, A. K. Jackson 2, J. Webster Allen; 3, H. C. Musgrove; 4, R. M. Jackson; 5, James McKenzie.

Cow, 2 years old—1, E. J. Johnston; 2, Jas. McKenzie; 3, M. P. Gillis.

Heifer, 2 years old—1, Jas. C. McDonald; 2, Thos. C. Hart; 3, J. A. McCormack.

Heifer, senior, yearling—1 and 5, Jas. McKenzie; 2, Dan A. McAdam; 3, M. P. Gillis; 4, H. A. Moffat.

Heifer, junior yearling—1, E. J. Johnston; 2, Andrew McDonald; 3, Henry J. Boutilier; 4, Thos. C. Hart; 5, H. C. Musgrave.

Heifer, senior calf—1 and 4, George D. Oland; 2, Jas. McKenzie; 3, John McMullin.

Heifer, junior calf—1, Dan Young; 2 and 3, E. J. Johnston; 4, Jas. McKenzie; 5, Geo. D. Oland.

GRADE AYRSHIRES AND GRADE HOLSTEINS.

Cow, 4 years and over—1 and 4, A. K. Jackson; 2 and 3, D. R. Nicholson; 5, H. A. Moffat.

Dry Cow, 4 years old—1, 3 and 4, D. R. Nicholson; 2, C. A. Munn; 5, G. D. Oland.

Cow, 3 years old—1, H. A. Moffat; 2 and 3, M. P. Gillis.

Dry Cow, 3 years old—1 and 2, D. R. Nicholson; 3, H. A. Moffat; 4, M. W. Ross & Son; 5, Dan McRae.

Cow, 2 years old—1 and 3, D. R. Nicholson; 2 M. W. Ross & Son; 4, H. A. Moffat; 5, A. K. Jackson.

Heifer, 2 years old—1, W. Drysdale; 2, A. F. McNeil; 3, D. R. Eicholson.

Heifer, senior yearling—1, H. A. Moffat; 2, 3 and 4, D. R. Nicholson.

Heifer, junior yearling—1 and 2, J. S. McLennan; 3 and 5, H. A. Moffat; 4, D. R. Nicholson.

Heifer, senior calf—1, H. A. Moffat; 2, C. A. Munn; 3, A. K. Jackson; 4, and 5, Murdo McKenzie.

Heifer, junior calf—1 and 4, G. D. Oland; 2, H. A. Moffat; 3, D. R. Nicholson.

Sheep

were judged by M. H. Parlee, Lower were judged by M. H. Parlee, Lr. Millstream, N. B. The competition in the sheep classes was not so keen as the extent of the sheep breeding industry in Cape Breton would warrant. There are some large flocks of high grade and not a few pure bred sheep to be found in the four counties. The sheep were all brought out in a thrifty field condition, without any extra fitting or trimming and showed that the breeders are selecting robust strains for their foundation flocks. We look for lively competition in the sheep classes at Sydney in future years.

Prizes were awarded as follows:

LEICESTERS.

Ram, 2 years or over—1, John McLean.

Ram, over 1 year and under 2 yrs.—1, Nelson Beaton.

SOUTHDOWNS.

Ram, 2 years or over—1, Neil McDonald; 2, W. M. Hill.

SHROPSHIRES.

Ram, 2 years old or over—1 George's River Agricultural Society.

Ram, 1 year old—1, E. J. Johnson.

Ram Lamb—1, John P. Harvey; 2 and 3, Neil McDonald.

Ewe, 2 years old—1, John P. Harvey; 2, Neil McDonald.

Ewe Lamb—1, John P. Harvey.

OXFORDS.

All prizes awarded in this class went to E. J. Johnston, George's River, without competition.

ANY OTHER PURE BREED

First prizes on aged and shearling Zulu Rams were awarded in their class to Prof. Bell, Beinn Breath, Baddeck. These rams are speckled black and white, have four horns, one pair coiled and another pair straight or curved. Their origin is supposed to trace back to Jacob's speckled flock of Biblical fame. The reader can acquaint himself with their history by reading Genesis 30th chapter.

GRADES, (Long Wool.)

Ewe, 2 years or older—1, Allen Boutilier.

Ewe, over one year old—1, 2 and 3, Allen Boutilier.

Ewe Lamb—1, Albert Ferguson; 2 and 3, Allen Boutilier.

Pen—1, Allen Boutilier.

GRADES, (Medium Wool.)

Ewe, 2 years or older—1, E. J. Johnston; 2, John P. Harvey; 3, John McMullin.

Ewe, over 1 year—1, George's River Agricultural Society; 2, E. J. Johnston.

Ewe Lamb—1, John P. Harvey; 2, John McMullin.

COMMON SHEEP.

Ewe, 2 years old and over—1, George's River Agricultural Society; 2, Neil McDonald; 3, W. M. Hill.

Ewe Lamb—1, Neil McDonald; 2 and 3, Nelson Beaton.

FAT SHEEP.

Fat Ewe.—I, Neil McDonald; 2, Albert Ferguson.

Fat Wether—1, W. M. Hill.

Fat Ewe Lamb—1, John P. Harvey.

Fat Wether Lamb—1, John McMullin; 2 and 3, E. J. Johnston.

Special prizes donated by Hon. Senator McDonald, Glace Bay, for :

Best Yearling Ram—1, E. J. Johnston; 2, Nelson Beaton.

Best Yearling Ewe—1, E. J. Johnston; 2, Allen Boutilier.

Swine

Berkshires, Yorkshires, Chester Whites and their Grades made up the Swine Classes at Sydney. M. H. Parlee placed the awards. With the exception of first prize on sow, 1 year old or over, which was captured by R. M. Jackson, all the other prizes awarded in this class went to a good lot of black and whites, owned by D. R. Nicholson, who captured with them the Cape Breton County Sweepstakes prize for best purebred

ORDER FROM OUR MAIL ORDER DEPARTMENT

New Style Book FOR 1912-1913 FREE ON REQUEST

Have you received your copy? If not send your name and address on a post card to-day.

THERE'S A DIFFERENCE in the garments our new Fall and Winter Style Book portrays to what you find shown elsewhere. That newness and exclusiveness of style, that attention to detail, which, combined with the high quality of the cloth and expert workmanship which our garments possess, assure one of entire satisfaction as to style, fit and wear.

We do not cater only to women and children but also give particular attention to MEN'S APPAREL. See our special "WINTER OUTFIT" offer.

IT COSTS NO MORE TO BUY GOODWIN'S GOODS, and our absolute guarantee protects you against any possible loss.

REMEMBER, WE PREPAY CHARGES ANYWHERE IN CANADA.

boar and three females. The prizes in the other sections were awarded as follows:

YORKSHIRES.

Boar, over 1 year old—1, A. K. Jackson.

Boar, under 1 year old—1, D. R. Nicholson.

Sow, 1 year old or over—1, John McQueen; 2, Eldridge Hill; 3, Ira Hughes.

Sow, over 6 months—1 and 2, Murdo McKenzie; 3, D. R. Nicholson.

Sow, under 6 months—1, D. R. Nicholson; 2, John P. Harvey.

Sow and litter—1 and 3, D. R. Nicholson; 2, R. M. Jackson.

Best Herd—1, D. R. Nicholson.

CHESTER WHITES.

Boar, 1 year old—1, Ira Hughes; 2, Dan McRae; 3, John McMullin.

Boar, under 1 year old—1, D. R. Nicholson; 2, Ira Hughes; 3, John McMullin.

Sow, 1 year old or over—1 and 2, Ira Hughes; 3, John McMullin.

Sow, over 6 months and under 1 year—1, Ira Hughes; 2 and 3; D. R. Nicholson.

Sow, under 6 months—1 and 2, Ira Hughes; 3, John McMullin.

Sow and Litter—1, Ira Hughes.

Best Herd—1 and 3, Ira Hughes; 2, D. R. Nicholson.

GRADES AND CROSSES.

Sow, 1 year old or over—1, Dan. McRae.

Sow, 6 months old and under 1 year—1 and 2, Ira Hughes.

Sow, under 6 months—1 and 2, Nelson Beaton.

Fat hog, sow or barrow, under 1 year—1, John McMullin; 2 and 3, Jas. McKenzie.

THE POULTRY.

Seth Jones, Poultry Superintendent for New Brunswick, placed the awards in the poultry classes which were well filled with choice birds, some of which had been imported at high prices. The hen fever has a strong hold of the Cape Breton exhibitors. Their well equipped poultry house was filled and a large tent had to be utilized to house the overflow, which would have made a show of quite respectable dimensions.

FRUITS AED VEGETABLES.

G. H. Vroom, judged the fruit, which for quantity, coloring and uniformity was a revelation of Cape Breton's fruit growing possibilities.

O. W. Wetmore, Clifton, N. B., placed the awards in the vegetable and grain classes, and so far as quality and quantity was concerned the exhibits far out-classed the showing made at either St. John or Halifax. Cape Breton farmers can grow vegetables that are the equal of any produced in Maritime Canada. The best seed collection from any one farm in Cape Breton County was shown by R. B, Murray, Coxheath. The prize winning County collections of vegetables were shown by H. A. Moffat, D. R. Nicholson, John McMullin and Harry Lewis.

DAIRY PRODUCE.

The dairy products made up an aggregation of quality that was hard to beat. There were nineteen entries in the tub butter section and thirty-four entries in prints. The cheese section had two entries of home made quality that was very good.

LADIES FANCY WORK.

The Woman's Department contained samples of fancy work, domestic and household arts that would be hard to excel at any show in Canada.

Mrs. I. W. Leonard and Mrs. H. A. Moffat had the best collections of fancy work. Miss Effie McDonald, Enon, placed the awards.

The Yarmouth County Exhibition.

The weather man favored the Yarmouth exhibition from start to finish and in this, helped to make the attendance at the fair a record one. The show, taken all the way through, was the best in the history of the Society, both in number and quality of the exhibits.

A large number of local firms, and outside exhibitors filled the main building to capacity. The management served good attractions in addition for both afternoons and evenings.

Some of our Provincial Exhibitions can take a lesson from Yarmouth, in having confortable sleeping quarters for stock men. A comfortable bunk house was fitted up with bunks, tables and chairs.

The only other place, to our knowledge, having such good quarters, is Chatham.

Yarmouth also has new sheds for cattle, horses and sheep.

The ladies in charge of their respective departments deserve great credit for the way in which their classes were filled with Fancy Work, Domestic, Manufactures etc.

The flower exhibit, especially attracted a great deal of widely deserved attention, no finer being shown at any of the other exhibitions. In one class of dalhias alone there were sixty-five varieties.

The fruit exhibit was splendid and astonished any one not familiar with Yarmouth County. The show of apples compared favorably with any of the larger exhibitions, the variety being good and the fruit in fine condition.

A very large exhibit of plums and pears, also two large exhibits of grapes, one shown by Robert Caie, the other by Dr. I. M. Lovett.

The exhibit of seeds was small, even dropping below that of former years.

The display of vegetables was not as large as usual, but of good quality, the potatoes being especially good. Some of the chief exhibitors in this line were G. Israel Allen, G. A. Allen, and Geo. Murphy.

The products of the dairy were to be seen in abundance. Yarmouth Creamery Co., had a very large exhibit of butter in crocks, tubs, and prints. This factory has been in operation less than a year, but under the efficient management of Chipman and Porter, is now making a ton of butter a week.

CATTLE.

Every section of the classes for cattle was filled. The Shorthorn herd of Dr. Lovitt, the Guernsey herd of H. W. Corning, and the Devon herds of Chas. and Wm. Pinkney were to be seen in even better shape, than at St. John and Halifax shows.

We have had a wrong impression of the Devons seeing them at our Provincial shows, as there they have to show against strictly beef cattle, but in their own home they are used as a dual purpose cow, perhaps a little strong on the dairy side; therefore they are hardly in the right place in a strictly beef class, as it does not do to fatten them.

We understand one owner has ruined three good dairy cows for the sake of competing in the beef classes at our provincial shows.

Considering the difficulties the Devons have to contend with, they deserve greater credit than we have heretofore given them.

There was a very large exhibit of grade Guernseys and Jerseys, showing how well the County is adapted to dairy purposes.

In the Devons Wm. Pinkney and Chas. Pinkney took about everything, Everil Burrill and H. D. Hutman coming in with some good grade Devons.

In the Ayrshires, C. Morrell, Brookline, took first in aged cow class with O. L. Churchill second and third, who also won first in 3 year-old cow class with no competition. Morrell won first with two-year-old heifer in milk, Churchill second. The latter took first money in the yearling class, with Mr. Tartar second.

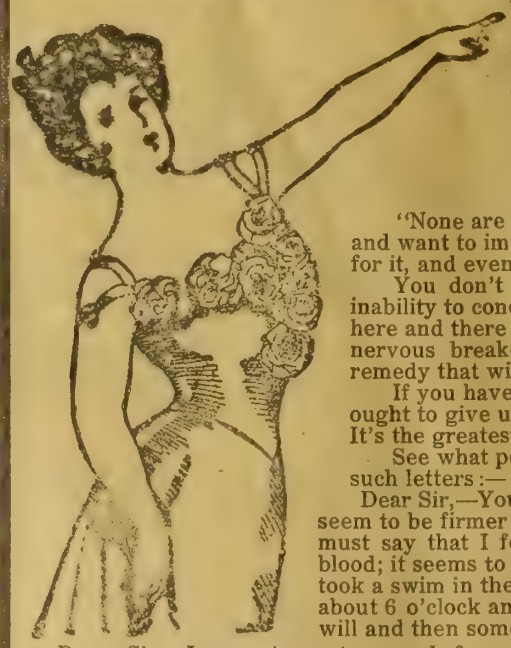
Morrell won first in senior heifer calf, also first and second in junior heifer calf with Curchill third.

In grade Ayrshires, A. Servant won out with aged cow, A, Corning second, M. R. Crosby third.

First in 3 years-old went to Churchill with no competition. Morrell won first in 2 year-old heifer, Tartar first in yearling heifer, Churchill came to the top in senior heifer calves with Morrell second. Tartar won with junior calf, no competition.

Guernseys.—H. W. Corning took all

Weak Men, Have Courage!



It you get up in the morning with a dull brain, tired nerves, an ache in your back, a dread of the toil and hardships of everyday life, these are the signs that your vitality is at a low ebb - that some of the organs or functions of your body are in a weakened morbid condition.

If you are a young man, and free rein for evil habits and passions have exhausted your vital energy, or if on the shady side of 40, you have not the strength and stamina that should be possessed by a man of your years, you can regain your health, strength and energy with Electricity.

"None are so blind as those who will not see," but if you are open to conviction and want to improve your condition, I can convince you that my Belt, does all I claim for it, and even more.

You don't need to be taught that restless nights, sleeplessness, despondency, inability to concentrate your thoughts, loss of appetite, weak back, headache, pains here and there in other parts of your body, lack of energy and push, are all signs of nervous breakdown, physical debility; you know that, but what you want is a remedy that will restore the vitality that you have lost.

If you have doctored and drugged and got no benefit, that's no sign that you ought to give up. Drugs can't restore your vitality. Electricity is for men like you. It's the greatest nerve builder and body builder in the world to-day.

See what people say who have used my Belt. Every mail I get brings scores of such letters:—

Dear Sir,—Your Belt has been a boon to me. The emissions have ceased, the testicles seem to be firmer and increased in size. My Rheumatism in the shoulder has gone. I must say that I feel that life is now worth living. The most noticeable thing is the blood; it seems to have increased very much in circulation. Before using the Belt, if I took a swim in the lake I very soon got cold, but now I am in the water every morning about 6 o'clock and don't feel the cold at all. I think your Belt will do all you claim it will and then some more. I remain, A. G. ROFFEY, Wabigoon, Ont.

Dear Sir,—I cannot say too much for your Belt. I consider it completely cured me of Rheumatism and I never felt so well for the last thirty years. I would recommend it to any railroad man suffering from weak back or kidney disease. I only wore my Belt for one month.—WILLIAM HONAN, Cochrane, Ont.

My Belt, with special Electric attachment, will restore your vigor. It will check all loss of vitality, and affects every organ of the body. It cures Nervous Debility, Varicocele, Rheumatism, Lame Back, Lumbago, Sciatica, any case of Kidney Disease that has not gone as far as Bright's Disease, Stomach Trouble, Constipation.

THE WORLD HATES A QUITTER—If you go into a fight, stay with it, no matter how poor your chances look. The other fellow probably wants to quit, and if you hold your head up he will quit first.

The victory to the brave. It takes nerve and energy to win nowadays.

You don't want to be a failure. You are made for better things, but you can't win without courage and energy. That's the idea behind my Electric Belt, the body battery that pours electric vim into a man's body.

Get My Book! It's Free!

Call at my office if you can. If you cannot, cut out this coupon, mail me your address, and I'll send you my beautifully illustrated 80-page book that is full of sound facts that you ought to know.

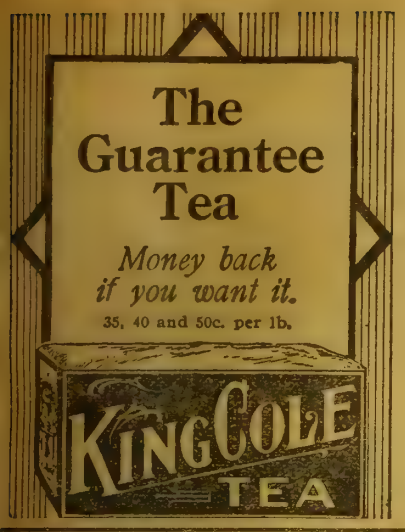
ADDRESS .....

Office Hours: 9 a.m. to 6 p.m. Wednesdays and Saturdays until 8.30 p.m.



the firsts in the Guernsey class. Lloyd Cook took second in 2 year-old bull, Harry Boyd second in Junior calf and second in 3 year-old cow. Boyd also took second with senior calf.

A very strong class of grades was shown, A. Servant winning out in aged cow, Geo. Murphy second, M. R. Crosby third. First in 3 year old cow went to G. W. Cook, second to James Earle. Cook also got first in 2 year old heifer in milk with no competition. Earle captured first and second in 2 year old heifers. In yearling heifers, Murphy came first, Boyd second and W. L. Cook third. In senior calves Crosby first, W. L. Cook second, A. Servant third. In junior calves, Murphy first, Corning second, W. L. Cook third.

JERSEYS.

3 year old bull.—1, W. L. Cook.

2 year old bull.—1, Harry Conn; 2, Benjamin Bain; 3, J. C. Corning.

Yearling bull.—1, F. G. Cook; 2, J. C. Corning; 3, D. Trask.

Senior bull calf.—1, Harry Conn; 2, A. C. Rose, 3, Corning.

Junior bull calf.—1, Conn; 2, Corning; 3, H. Cook.

4 year old cow.—1, A. Corning; 2, J. C. Corning; 3, Geo. Murphy.

3 year old cow.—1, Conn; 2, H. Boyd; 3, H. Conn.

2 year old heifer in milk.—1, J. S. Corning.

2 year old heifer dry.—1, A. C. Rose.

Yearling heifer.— 1 and 2, Conn; 3, H. B. Cook.

Senior calf.—1, G. W. Cook; 2, Geo. Murphy; 3, S. Bain.

Junior calf.—1, Bain; 2, Trask; 3, Murphy.

GRADE JERSEYS.

4 year old cow.—1, Cook; 2, Corning; 3, Frank Cook.

3 year old cow.—1, M. S. McConell; 2, H. Murphy; 3, J. C. Corning.

2 year old heifer in milk.—1, Mrs. A. B. Crosby; 2, Ross Durkee; 3, Corning.

2 year old heifer, dry.—1, Wm. Churchill, no competition.

Yearling heifer.—1, M. Harris; 2, Chas. Doane; 3, H. Pitman.

Senior calf.—1, A. Cook; 2, Vernon Allen; 3, Bain.

Holsteins.—Only one Holstein bull was shown being a six months old calf owned by Herman Churchill.

Stephen Churchill took first money in aged cow with A. Corning second. Corning took first in 2 year-old heifer in milk and first in dry class, first in yearlings.

GRADE HOLSTEINS.

G. W. Churchill took first in aged cow, A. Corning second. F. Rose first in 2 year old dry heifer, no competition. C. H. Doane first in yearling, no competition. S. Churchill first in senior heifers, A. servant second. M. Harris first in junior heifer, A. Servant second.

In the Herefords, only one aged bull was shown also one cow and bull calf by Geo. H. Burrill. Burrill also got first in grade cows both 3 and 4 yrs. old. Everil Burrill first in grade 2 year old heifer in milk; Foster Burrill first in dry class with George Burill second. First in yearling heifer went to Geo. Burrill also senior calves, second R. Bain; 3, Burrill.

Junior calves won first by Everil Burill; 2 and 3, to Geo. Burrill.

OXEN.

Working oxen were the strongest class in the show, there being thirty yokes on exhibition.

Pair 7 years old.—1, R. McDonald; 2, F. Churchill; 3, J. Corning.

Pair 6 years old—1, H. Killam; 2, Jutson Clements.

Pair 5 years old—1, J. Winters; 2, H. Cook; 3, Chas. Pinkney.

Pair 4 years old—1, S. Panels; 2, H. Denis; 3, F. Doucett.

Pair 3 year old steers—1, M. Fraughten; 2, A. Spears.

Pair 2 year old steers—1, H. Churchill; 2, Capt. Goudy; 3, A. Studley.

Yearlings—1, G. Cook; 2, R. Goudy; 3, L. Ellis.

Senior steers, calves—1, Burrill; 2, Capt. Goudy; 3, S. Cook.

Junior steers, calves—1, L. Cann; 2, Burrill; 3, R. Goudy.

BEEF CATTLE.

Pair oxen, 4 years old—1, D. Sanders; 2, Geo. Handy.

Pair steers, 3 years old—1, Cann; 2, D. Trask.

Pair steers, 2 years old—1, Burrill.

Cow, 3 years and up—1, Dr. Lovill; 2, A. Corning.

There was a fairly good exhibit of horses especially in the light draft class, Capt. Goudy winning first in 4 year olds, H. W. Corning second. Three year olds, C. Cann won the money and in 2 year olds A. Corning with Geo. Cleveland second.

J. M. Trefry won first in Percheron stallion. D. S. Churchill won first on pair carriage horses. Dr. Webster took first on Hackney stallion.

Some splendid standard breeds were shown, Burges Blackadair's mare "Fannie Lambert" by "Revolution" by "Rampart" won first in brood

mare with foal. The foal which is sired by "Kivera" also won first. One of "Fannie Lambert's" colts sired by "Kivera" won first as 2 year old in the roadsters class, owned by J. A. Blackadar.

James A. Blackadar won first with another yearling "Kivera" colt in the roadster class.

SHEEP.

This exhibit was a little behind the usual number. In Cotswolds, F. Rose took first on ram 2 shears, Arthur Winters first on yearling ram. Rose took first second and third on ram lamb. First on ewe 2 shears went to G. W. Churchill; 2, Rose; 3, Geo. Hardy. In sheasling ewe, all prizes went to Rose. Geo. Hardy won first on ewe lamb, Rose second and third.

In Shropshires, Chas. Butler won first on ram 2 shears with C. M. Killam second, J. C. Corning third. First and second yearling ram went to H. Cameron. First ram lamb to Corning; second to Cameron. Ewe 2 shears, won by Cameron, second and third Corning. Cameron also won in shearling ewe, and in ewe lamb with Corning second and third.

M. Lamont showed everything in the Southdowns, Stewart Servant in Oxford Downs, Emerson Servant in the Dorsets.

A few good grade sheep were shown by the different pure bred breeders.

H. Cameron won a special of ten dollars for best yearling sheep, bred by exhibitor.

Clark Killam won special of five dollars for best pen of three lambs from pure bred Shropshire.

SWINE.

A large exhibit of swine was shown. A. Servant had his own way in the Poland Chinas, J. C. Corning the same in Berkshires, H. W. Corning in Chester Whites, and Wm. A. Churchill and J. C. Corning in the Yorkshires.

Some grades were shown by Edward Cann, G. W. Cook and H. W. Corning.

POULTRY.

The poultry exhibit was a little smaller than usual but of good quality, especially in White Wyandottes and Brahmas. Mr. Landry of Truro, judged the poultry in his usual efficient manner and while in Yarmouth has promoted a Poultry and Pet Stock Association.

In the hauling contest there were eight contestants the first prize going to Chas. Pinkney whose cattle weighed 2,300, load 4,100 lbs.; second prize Peter Muise, weight of cattle 2,300 load 3,800 lbs.

The sale of sheep, which was to have come off the first day of the show, did not take place, owing to the fact that the carload did not arrive. A large number of people were disappointed in this but will be able to satisfy their wants at a later date.

R. Robertson, Nappan, judged dairy cattle, Mr. Harding, Ontario, judged sheep swine and beef cattle, Mr. Cunningham, Ont., judged horses.

Victoria Co. Field Crops Competition.

The Victoria County Seed Growers' Association took up the Field Crop Competition for this year, instead of the Agr. Society as formerly.

Judging was done by Mr. Wm. Moore of Scotch Lake, York County.

There were three classes, namely—Wheat, Oats and potatoes, with eight prizes in each class.

Following is a list of those who entered the competition with the score made, the first eight being prize winners.

WHEAT.

Christian Adams, 92; J. F. Johnson, 91½; Donald Innes, 90; Frank Baird, 84; Samuel Wark, 79; C. E. Pickett, 75½; Bruce Ervin, 64½.

OATS

Elijah Sisson, 91½; Donald Innes, 91; F. E. Henderson, 87½; Bruce Ervin, 86; C. E. Pickett, 85; J. A. Graham, 84½; Charles Wallace, 83½; A. J. Jensen, 80; Robert Henderson, 71; Robert Ervin, 66½.

POTATOES.

J. A. Graham, 94; Herbert Manzer, 92½; Frank Baird, 92; Elijah Sisson, 91½; J. F. Johnson, 91; Harold Sorensen, 90; Charles Wallace, 89½; C. E. Pickett, 89; J. P. Jacobsen, 86; Robert Henderson, 83; Donald Innes, 82; Robert Ervin, 79.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Box D., Sussex, N. B.

"Jane & Jake" For Sale

I bought a pair of Grey African Geese paying for them (young birds) $12. I sold the birds they raised that fall before the snow flew, for ($50) fifty dollars clearing ($88) thirty-eight dollars. I have a splendid pair for sale "Jane" and "Jake" Jane is a two-year-old, she layed (50) fifty eggs this season. Jake is a yearling and the best bird (male) I raised this season, he's enormous and an elegant bird. These birds will make a lot of money for anyone who wants to take up geese. I still have some extra fine turkeys for sale. Indian Runner ducks, Sicillian Buttercups, sired by a bird imported from Italy.

SARAH E. MOSES SMITH,
Woodward's Cove, Grand Manan.

Nitrate of Soda of Chili.

It is of special interest to note the prevailing prices of the materials supplying Nitrogen, commonly desingaed "Ammoniates," in the wholesale fertilizer market, and the very low cost of Nitrate of Soda is especially noteworthy.

All the sources of Nitrogen except Nitrate of Soda are commanding unusually high prices. In the principal North American markets the leading materials which are used by Fertilizer Manufacturers have been for several months and are now quoted as follows:

Dried Blood	$3.00 to $3.05 per unit
Tankage	2.70 per unit
Sulphate of Ammonia	2.50 to 2.52½ per unit
Nitrate of Soda	2.23 per unit

by using Nitrate of Soda!

But when it is considered that Nitrate of Soda is completely and immediately available and that none of the others possesses both these qualities, it is readily seen that Nitrate of Soda would cost the user still less. The following table, based upon the present quotations, and also upon relative availability, shows how very much less.

Dried Blood (only 73 p.c. available! $4.11 to $4.18 per available unit.

Tankage (only 62 p. c. available) $4.35 per available unit.

Sulphate of Ammonia (only 90 p. c. available) $2.77½ to $2.80½ per available unit.

Nitrate ol Soda (100 p. c. available) $2.23 per available unit.

A saving of from 19½ p. c. to 48½ p. c. by using Nitrate of Soda.

Since the above quotations are for the leading materials used in making all so-called "complete" fertilizers, why not buy your ingredients separately and mix your fertilizer yourself? You will then know that you have secured the cheapest and best form of Nitrogen, and satisfactory forms of the other elements.

The strange and deleterious acidity of Sulphate of Ammonia, which has of late been used so much by certain fertilizer manufacturers as a source of Ammoniates, is an additional reason for avoiding the use of so-called "complete" goods, and buying Nitrate of Soda.

If the manufacturer has to pay so much for his Ammoniates and uses those of acid character merely because he thinks the mechanical condition of his mixtures may be better, how can he sell you at high prices?

Lime Carried Off by Crops.

There is a continual drain in the stock of lime in the soil by the crops; thus the following crops, including grain and straw, carry off respectively:—

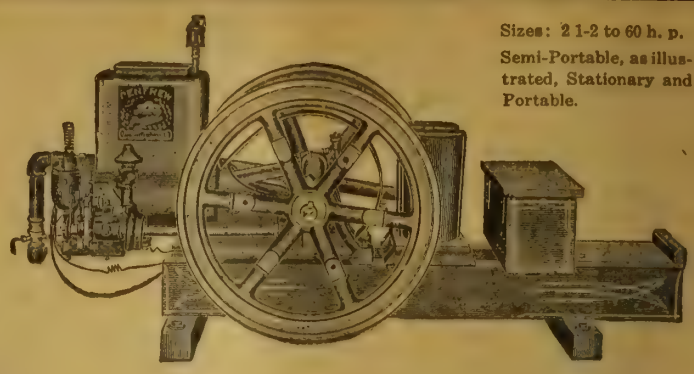
Wheat	25 bushels	13 lb
Barley	40 bushels	17 lb
Oats	50 bushels	22 lb
Turnips	20 tons	118 lb
Potatoes	8 tons	40 lb
Red Clover	2 tons	77 lb
Rye Grass	2 tons	30 lb

The above quantities are not constant, and much of the lime may be returned to the land in the straw, the tops and the manure; but still the land cannot fail to suffer a certain annual loss of lime from the above causes.

P. E. I. Stock Breeders will Continue to Support Maritime Winter Fair.

At a meeting of the P. E. Island Stock Breeders Assn. on September 25., it was decided unanimously not to hold a Winter Fair on the Island, but to continue to make the grant to the Maritime Winter Fair at Amherst, and thus make that Fair bigger and better than ever.

A local horse fair will be held at Charlottetown, in spring of 1913.—H. D. B.



Sizes: 2 1-2 to 60 h. p.
Semi-Portable, as illustrated, Stationary and Portable.

Announcement

THE success of the Standard Cream Separator has encouraged us to place upon the market a high-type of gasoline engine. This engine will be known as the

Renfrew Standard

and will, in every way, be a fitting companion for the celebrated Standard Separator. In a few short years, the Standard Separator won its way into wide favor throughout Canada solely on its merits. We believe that the Renfrew Standard Gasoline Engine will score just as rapid a success. We would be glad to send you our Bulletin describing this engine and showing the different types. Write for a copy.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

Eradicating Weeds.

James R. Buckman, writing to the Lincoln Chronicle, says that it is possible to get rid of orange hawk weed and any other kind of weed. It is a method of cultivation somewhat different from that which we have several times described, but it is such a good method that we are glad to recommend it as widely as possible. He says:

I will state that there is an effective method of eradicating not only this most serious of weeds, but also the white weed, ox-eyed daisy and buttercups from the hayfields. I have practiced it successfully on two different farms I have bought in a much run-down condition and have renovated to my satisfaction and that of my neighbors who are at times more critical than myself. The remedy is to utterly destroy the sod in the hayfields, cutting it over before the weeds go to seed and then burning the hay as it lies on the ground. I then plow deeply and let the ground lie until the latest possible date before frost comes. Then I harrow it again with the disk harrow that has followers on the disks. I then let the land lie idle until spring. I then prepare the land for a hoed crop and plant such a crop, varying it accordinf to the nature of the soil. I have used beans, sweet corn, yellow corn, cabbages, beets and turnips on such tracts. I have put in a surplus of fertilizing material and worked it in thoroughly. Then I have used the horse cultivator rather more frequently than would seem really necessary.

After pulling the crop, I bunched the tops and plowed them under. Then I sowed winter rye and let it grow as it would; the next spring I plowed the rye under and sowed grain and clover, then I turned the cattle into the clover and let them graze on it until snow came.

Then the next spring I plowed under the clover and sowed grass seed, and have not failed to secure a good catch of grass free from weeds. It might have been better, perhaps, to plow the clover under in the summer or fall, but in each case I felt that my cattle needed it to eat, so I turned them into it and they thanked me in every way they could.

There is no other way to get rid of this pest, or these pests, for I include them all in the same list. It might come hard on a farmer who does not have land enough so he could shift around from field to field for his hay crop; but hardships yet more serious may come upon us if we do not turn to and eradicate the evil. Our hay will become a drug on the market with no one to buy it or anything to eat it.

Possible Increase of a Grain of Wheat.

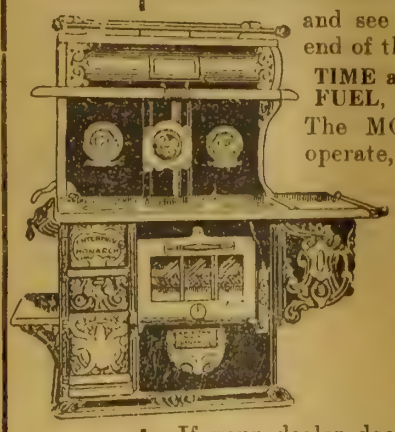
It has been calculated by a German philosopher that a single grain of wheat produces fifty grains, and that these fifty will each produce fifty grains more, and so on. Thus he finds that the grain would develop in the following way:—

In the second year, 2,500 grs.
In the third year, 125,000 grs.
In the sixth year, 15,625,000,000 grs.
In the twelfth year, 244,140,625,000,000 grs.

The third year's crop would give 300 men one meal, leaving enough bran to feed eight pigs for one day. The produce of a single grain in the twelfth year would suffice to supply all the inhabitants of the earth with food during their lifetime.

Buy Now

AN ENTERPRISE MONARCH STEEL RANGE



and see how far ahead you will be at the end of the year in

TIME and therefore TEMPER } SAVED
FUEL, which means MONEY }

The MONARCH is simplicity itself to operate, for it has no complex dampers or troublesome drafts.

Every device embodied in it is practical, neat and effective so that the MONARCH as sold today is the most compact steel range on market—handsome in design, a "tip-top" baker, and so economical in fuel that it will soon pay for itself.

If your dealer does not handle this range, fill out a p. c. with your name and address and request for copy of our new illustrated circular. One cent so invested brings Big Returns.

THE ENTERPRISE FOUNDRY CO., Sackville, N. B.

Don't buy a Piano on the Instalment Plan Buy For Cash

Perhaps you may say that this advice is all very well for those fortunate enough to have the means to act upon it. You can buy for cash any piano or organ you wish from any dealer and thus get the advantage of his lowest cash price.

This Is How You Can Do It

When you have made up your mind what and where you are going to buy, just let us know and we will see that you get the instrument at the lowest cash price. If you have not sufficient funds to make up the amount we will supply you with the cash and charge you but 6 per cent. interest, your piano or organ will be our security.
There is not a catch about it anywhere, it's a straight above board business proposition
If will cost you absolutely nothing to get full particulars and you will be under no obligation in doing so either. Every request for particulars and every transaction is altogether free of any kind of publicity.

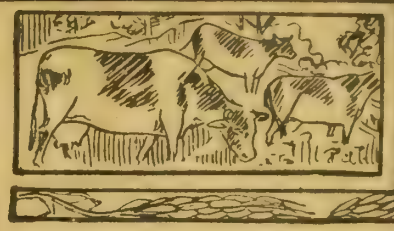
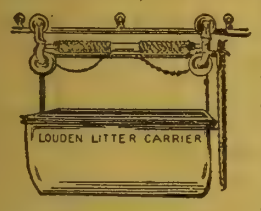
The Model Farm



Labor-Saving and Money-Making Equipment

A LOT HAS BEEN SAID about the scarcity of good farm help, and the difficulty our farmers have of keeping their sons on the farm. Well, most farmers have gone through the mill themselves, and can perhaps sympathize with the boy who seeks to get away from the drudgery that he imagines farm life has in store for him.

BUT WHY DRUDGERY? ABOUT the worst back-breaking work on a farm is stable-cleaning with old-fashioned methods. It certainly is a job any man would like to pass up. But fortunately modern methods with modern machinery have taken the drudgery out of stable-cleaning.

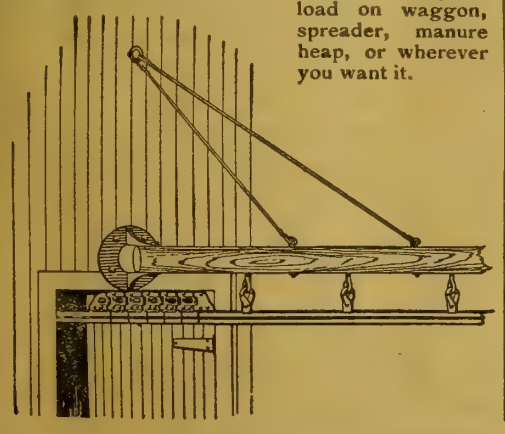


Nowadays, you fill a Louden Litter Carrier—raise it by a light pull on a chain—push the load easily and quickly to wherever you want it. Not much hard work for you in that, is there?

ALL EXPERTS AGREE THAT Liquid Manure is 50% more valuable than solid manure. Are you losing this 50%?

A Louden Litter Carrier will save it for you—and not only prevent the waste, but will make stable-cleaning an easy "chore."

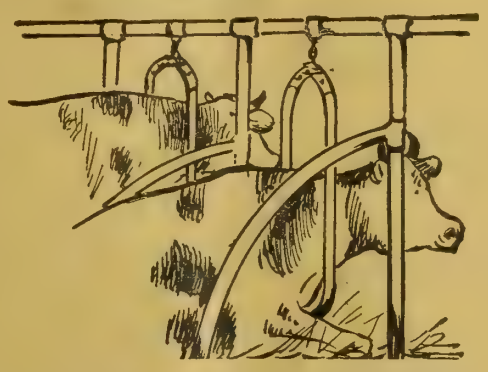
The Louden swinging equipment is an ideal way of disposing of manure. With it you get a twenty or a thirty foot swing, and can dump the load on waggon, spreader, manure heap, or wherever you want it.



A DISTINCT LOUDEN FEATURE is that you can run the loaded carrier right on to the pole while swinging at any angle. You do not have to straighten the track each load.

The *flexible hinge* permits the carrier to run over it while at an angle.

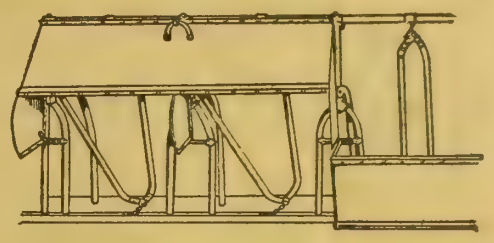
THE SUN-SHINY SIDE OF farming is the money-making side. An equipment that makes money is Steel Sanitary Stalls and Stanchions for cows. Now there is no doubt that a contented, comfortable, dreamy-eyed cow will give more milk than one housed in unsanitary, badly-ventilated quarters, where it has little freedom and comfort. And when you are thinking of cow profits, you must think of these things.



The most successful Farmers and Dairymen have thought of these things, and have equipped their stables with Cement Floors, Mangers, Steel Stalls, Stanchions, and Carriers for Feed and Litter. Stables so fitted are lasting, well ventilated and sanitary. Light and air with their germ-destroying powers fill every part of the stable. Under such conditions cows are comfortable and clean, which consequently means more and better milk, and this, in turn, means bigger profits.

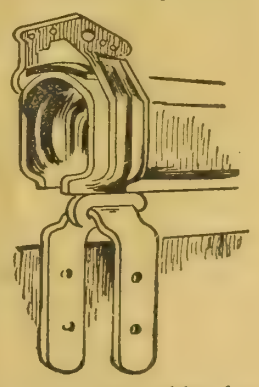
STANCHIONS. Louden Stanchions are perfect stanchions—perfect in construction—simple to lock and unlock—allow perfect freedom and comfort, yet provide a perfectly secure tie. They are made of smooth, light, strong, high carbon steel tubing, with malleable iron fittings. Construction and material are such that there are no crevices to harbor germs or dirt.

HOW DO YOU FEED YOUR cattle? Do you use the old-time shallow trough, where cows scatter their food in the feed-way, and steal each other's fodder—preventing the keeping of accurate records of feed costs and results?



Galvanized Steel Mangers are the modern way. They are convenient, and prevent feed-waste. They keep the stable tidy, too. The bottom is of cement, and the steel part is raised and lowered to allow the trough to be thoroughly cleaned. The trough can also be used for watering purposes.

EVERY FARMER HAS experienced annoyance and loss of time and temper over faulty barn-door hangers and tracks. The Louden Hangers are made in five different styles, to suit various conditions. We recommend Louden's Bird-Proof Hanger as illustrated.



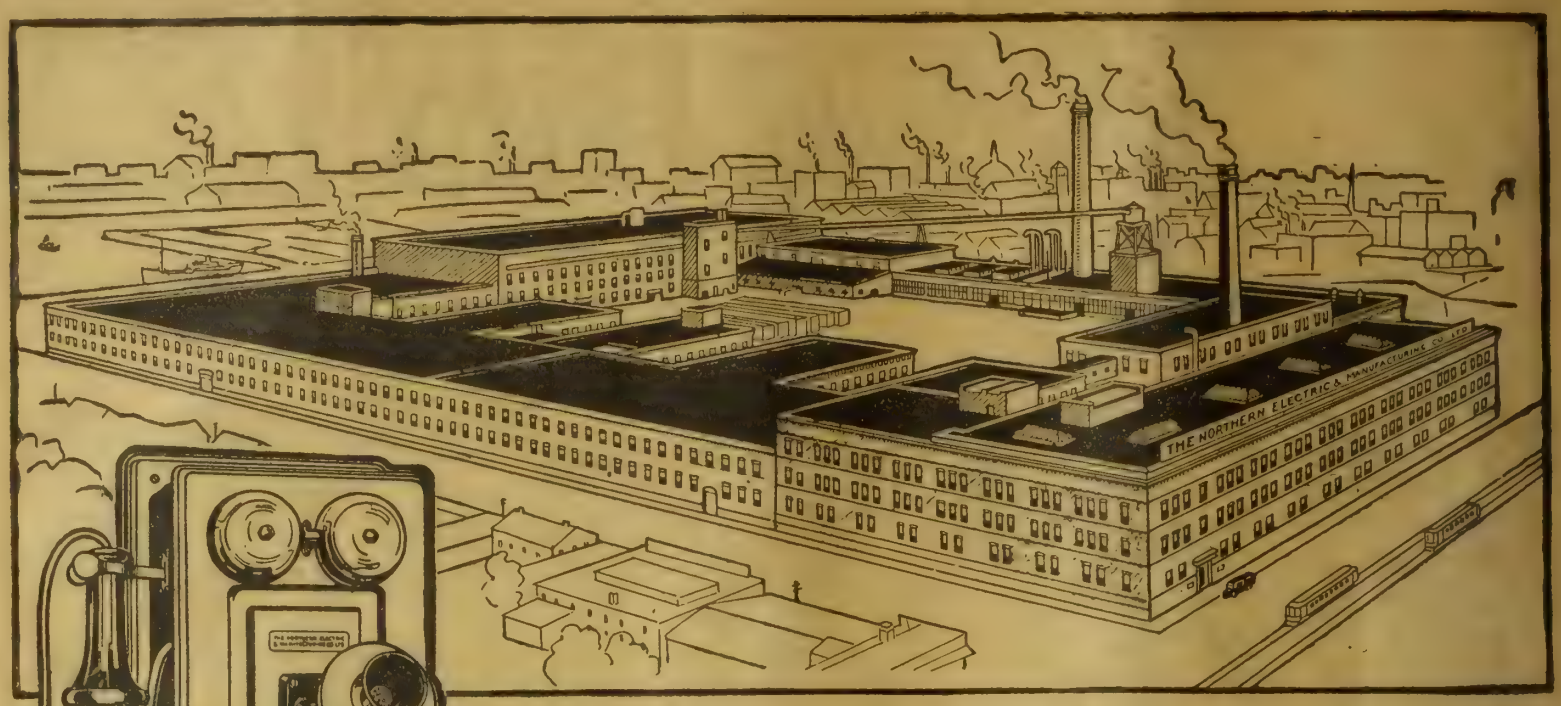
It is a hanger that gives perfect service all the year round. It always runs easily and cannot get out of order.

It cannot be clogged in any way—either by nesting birds or trash in summer, or by snow, ice or sleet in winter.

A USEFUL BOOK TO HAVE. Every farmer can find something useful in our book "Perfect Barn Equipments." It illustrates and describes many money-making, labor-saving devices, about which a farmer ought to know.

THE SERVICES OF OUR EXPERIENCED BARN ARCHITECT ARE AT YOUR COMMAND, FREE, FOR THE ASKING. TELL US WHAT YOU WANT.

THE LOUDEN MACHINERY CO. - DEPT. 18 - GUELPH, Ont.



This is the make of instrument that is on the wall of nine out of every ten telephone users in Canada.

THIS PLANT IN MONTREAL STANDS BACK OF EVERY NORTHERN RURAL 'PHONE

THIS is the immense Canadian factory where Northern Electric Rural Telephones are made—in fact, where ninety per cent. of the telephones used in Canada come from. Our big organization, with its branches extending straight across Canada, is ready to help you in every detail of the formation and construction of a rural telephone line in your own community. Not only will we help you with your company-organization, line-construction, instrument-installation, etc., but our men are ready to give you much personal help out of their own telephone experience. With the help we offer, you can easily interest your friends and neighbors and operate your own self-maintaining telephone system.

Send For Our Book FREE

"How to Build Rural Telephone Lines" is an illustrated, cloth-bound book of one hundred pages, full of a carefully indexed mass of information on rural telephones. This book tells you absolutely everything in detail. No other book in existence deals so thoroughly with the subject from your standpoint. While this book has been costly to produce and we really ought to charge for it, we will send it free to anyone who, by sending us the coupon, proves that he is really interested.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Llght" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

The D. F. Brown Paper Box Co., Ltd.
ST. JOHN, N. B.

This man uses a BT Manure Carrier instead of a wheelbarrow. He saves half the work and time of cleaning his barn, *saves all* the manure, prevents disease among his stock and increases his profits in a score of other ways.

There is no reason why you should not own a BT Manure Carrier. We have the figures to prove that it will save its cost with twelve month's use. Other men are making that saving. Why not You? Read the facts.

Don't be a Slave to the Wheelbarrow

Clean Your Barn the Easy BT Way

THE slow, hard, dirty, disagreeable work of cleaning the barn should now be a thing of the past. It is no more necessary to *wheel* the manure out than it is to *waste* the manure entirely. The BT Manure Carrier makes the work *play*---even for a boy. The big, 14 bushel tub lowers close to the floor. It is easily and quickly filled, with liquid as well as solid manure. It is easily raised---and an easy push runs the carrier out and away from the barn. Then it dumps its load directly into the spreader, wagon, shed, or on a pile---all *without any heavy work* on your part.

THE BT MANURE CARRIERS

You need one—if you want to have a *modern* dairy barn. You need one if you want to *save work and time.* You need one if you want to *help prevent tuberculosis* and *other* diseases among your cows. And we can *prove* that you *need one—if you want to increase your profits.*

Send for our new fine free book and read the facts.

Get the two BT Books Free. Cuts Barn Work in Two

Read of the *value* and *superiority* of the *BT Manure Carrier.* Know why it is the choice of men who investigate thoroughly. Read about the famous BT Track, the Hangers, the Friction Brake, the Hoist, the Latch and Latch Trip and *all* the other BT advantages. It will pay you well to

MAIL COUPON NOW!

Get your BT Carrier now and put it up while the work is slack. Be ready for the early cold snap. Let the BT save your time so you can do other rush work. Our guarantee protects you. Write us to-day. Our book also tells about BT Feed Carriers, Milk Can Carriers and Feed Trucks. Please ask for Carrier Book.

DE LAVAL
CREAM SEPARATORS

Cheapest As Well As Best

Every sensible person wants the **best** of everything, but in many things the best is beyond their means and they must necessarily be content with something else.

In the case of the Cream Separator, however, the **best** is fortunately the cheapest as well, and it is of the greatest importance that every buyer of a separator should know this.

Moreover, the **best** is of more importance in the case of the Cream Separator than in anything else, since it means a saving or a waste **twice a day every day in the year** for many years.

It is true that DE LAVAL Separators cost a little more in first price than some inferior separators, but that counts for nothing against the fact that they **save their cost every year over any other separator,** while they last an average twenty years as compared with an average two years in the case of other separators.

And if first cost is a serious consideration a DE LAVAL machine may be bought on such liberal terms that it will actually **save and pay for itself.**

These are all important facts which every buyer of a Cream Separator should understand and which every local DE LAVAL agent is glad to explain and demonstrate to the satisfaction of the intending buyer.

If you don't know the nearest DE LAVAL agent please simply address the nearest of our main offices as below.

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

The Harvesting and Housing of the Turnip Crops.

Short Cuts in Labor Saving

By W. M. Lea, Victoria, P. E. I.

THE harvesting and housing of the turnip crop will soon be engaging the attention of every Maritime stockman. Every Maritime stockman should have some to harvest. Where a scarcity of labor exists any method that will hasten and cheapen the handling of this crop is worthy of consideration, even if the manner of handling is rather rough shod. That turnips are a most excellent stock food no one will deny. It is hard to grow enough of them and we all hate to see them getting scarce, as they usually do in the spring. Turnips require considerable labour and suitable housing to keep them in the best condition.

Lady Woodland IV, Rosabella of Clifton, White Maid, Lady Bright and White Prince.

First Prize Shorthorn Breeder's Young Herd at the 1915 St. John Exhibition. Bred, owned and exhibited by C. A. Archibald, Bellevue Farm, Truro, N. S.

A good root house, convenient to the stable built frost-proof of either stone or concrete is the most satisfactory, but no one should be discouraged from growing turnips because he has no such accomodation as we keep them perfectly in a pit at very little expense. Now to get back to harvesting this crop, pulling by hand will probably make the nicest job. It looks best anyway, but as the cattle consume the crop this is immaterial as they are not particular about their appearance if they keep as well, and this they certainly will do when torn out with the harrow.

I have taken out many thousands of bushels of turnips with the knife, with a hoe, and with a harrow for the past ten years and, I would never think of punishing myself or my help by going back to either of the two first mentioned.

We grow both corn and turnips, large quantities of each, and consequently we are much too busy to use any but the most rapid methods of handling. We start the turnips with a light hoe cutting off the tops which can be done very rapidly when they are slightly wilted. Then we rake with a wheel rake into windrows, which we either cart off or fork over on to cleared ground, after which we harrow crosswise of the rows with an iron spike harrow giving two cuts and coming back on the same ground. This will loosen out all the turnips. The roots will be on and if wet some clay—in dry weather very little clay adheres. If the ground or day be cold we load with a fork, but if fine by hand. This method always strikes the uniniated as a barbrous method of handling turnips, but it really does the turnip very little damage as few bruises or cuts will be noticed. We always run them over a coarse screen befor storing in cel,-ar or pit.

Many people think that it is impossible to keep turnips in a cellar without rotting, but such is not the case. They can be kept there all right if properly stored, but we must see they have plenty ventilation and the temperature kept as near freezing as we dare.

Swede turnips are splendid keepers, and there is no good reason to have them rolling in the cellar. The trouble always is over heating and poor ventilation. If stored in the cellar, space must be always left between them and the floor sufficient for a good passage of air. It is a good plan in storing to put some sort of a ventilator at even distances through the pile, something that will carry off hot air. A couple of pieces of fence posts or poles stood on end together will answer the purpose very well. We never see the turnips in a cellar starting to rot around any of the ventilators. The pile should be carefully watched during the winter and as we use them throw over the remainder, if any appearance of heating occurs.

Storing outside in a pit keeps them in better condition than any other method and if properly handled, they turn out in April or May in exactly the same condition they went in in the fall. This method gives ideal cold storage conditions with enough moisture to keep them looking fresh and crisp. The important thing here is to see that we have sufficient banking around the lower edge and not too much on top.

We select a convenient place near the stable, so we can uncover in April when danger of frost is past and feed directly from the pile. We slightly hollow out the piece of ground large enough to hold all we wish to store and make a small ridge around to turn the water and keep the edge of the pile in slope. Then we pile the turnips as high as they will lay in a high round pile, and cover with any material we have on hand. We use seaweed, putting on a tier of boughs first to keep the seaweed out of the turnips, then we cover four feet deep around the edge tapering to a little over one foot in thickness on top. If in an exposed place we again put spruce bushes around the edge to collect snow and help the banking out. If the lower part is well banked I ameasy about the top as I have often seen the cattle kick turnips out by running over the pile in the midwinter, the covering being so thin, and still we never had them freeze there. I have seen a square, three or four foot fence erected to start the pile. We have tried this plan also but it is not so good as the other plan as it is harder to pack the banking around and keep the frost out.

We usually put six hundred to one thousand bushels up this way for spring feeding and can say they keep perfectly, are very little trouble storing there and not a great bother to bank. If a farmer has an up-to-date root house, large enough to hold any quantity he can grow, he does not need to do this, but if there is any man without such a building on his farm, by all means try the method I have described. Every stockman

Making the Best Use of Opportunity.

Seize Your Opportunity by buying Live Stock While the Owner is Anxious to Sell.

Opportunity is a queer word. It admits of so many interpretations. A good many of them say they have never met it. Others say it has passed by them, although they did catch a fleeting glimpse of the visitor's features. Some say it knocks but once at eveey man's door while others contend that each day brings fresh opportunities and thus it runs through the whole gamut of human experience.

About four years ago an interesting article appeared in the columns of the Maritime Farmer in which a full account was given of of the manner in which Logan Bros., proprietors of Homestead Farm, Amherst Point, N. S. had seized the opportunities offered in Maritime Canada for the breeding of pure bred live stock—how, from a small beginning with Holstein-Freisian Cattle they had, by careful selection and keen judgment in proper breeding lines, gradually worked up a breed of such quality that they were able in a few short years to capture the most coveted awards, not only at the Maritime Shows but also at Sherbrook and Toronto, where they had for their opponents the pick of the choicest Upper Canadian herds.

To again rehearse the facts in our columns would almost seem like repeating ancient history, never-the-less we feel that a good story cannot be told too often, as the history of these enterprising breeders may well serve as an impetus for more of our young men to go forward and do like-wise. The opportunity is yours if you will seize it.

The Maritime Provinces offer a great opportunity for the breeding of pure bred cattle—the scrub bull is too commonly found. Draw away from using scrub sires and head your herd with a sire that will increase its value from year to year. It is said that the best time to buy live stock iswhen the owner is anxious to sell.

Readers who are alive to their opportunities and who are interested in the improvement of their herds will find on page 67 of this issue the advertisement of a bargain sale of the Homestead Holsteins. Despite the fact that Logan Bros. have been selling choice individuals in the various sections of Canada and the United States and to fill the gaps in some of the Maritime exhibition herds where they and their progeny have been winning a large percentage of the profered prizes and other individuals to uphold the honors of some notable Western herds by carrying off such coveted awards as the male championship at the 1912, Toronto exhibition and the male and female championships at the 1911 Dominion exhibition, at Regina, yet the reader will note that they still have over 80 head of pure bred, registered Holsteins to offer for sale and upwards of a quarter of a hundred youngsters are expected to arrive before the dawn of 1913.

Winter is coming on apace and in order that the main herd may be reduced within the next 30 days to a number that may be comfortably housed, they have placed a price on every individual in the herd, and they will go to purchasers at a discount of from 20 to 50 per cent.

May not this be an opportunity knocking, that may not knock again, at some of our young men's doors.

Here is your opportunity; do not let it pass by if you want to get in on the ground flour in Holstein breeding or if you wish to improve your herd at a reasonable expense. If you let it pass by you may afterwards be found among the number who say that they simply saw a fleeting glimpse of opportunities' features.

We paid Homestead Farm a hurried visit a few days ago and had an oppotunity to take a run through the stables, pens and adjoining fields where over four-score head of Holsteins were quietly feeding and the picture presented in black and white was one that spelled "prosperity" in big capital letters. We were shown a trio of bulls, six months old, from dams with official records of 24 lbs., 22 lbs., and 20 lbs. butter, respectively, in seven days. In another pen were six yearling bulls of splendid breeding, which, if distributed throughout our provinces, would do a lot towards improving the next generation of cows. There was still another trio of bulls, 16 months old, with high official backing, and a two-year-old bull from a dam with a two-year-old butter record of 18½ pounds in seven days.

In the female line we saw 15 choice heifers from one year to 18 months of age, a splendid lot to start a herd, all of uniform good quality and some that would be hard to equal in any show ring. Ten cows just freshened, include some young ones of great promise. Then there are 15 cows due to freshen during the next four weeks —the best bunch combining show and producing qualities that has been our good fortune to see in one herd. They are nearly all under six years of age and are expected to make some good official records this fall. We also saw 8 or 10 matronly old cows that we used to see in the show ring and that are still doing good service at the pail and in producing young stock.

Three pairs of Clydesdale mares, each heavy with foal and in the pink of condition grace the Homestead stables. We doubt if an equally strong, uniform, well bred sextette of mares can be found in any other stable in Eastern Canada. An equally promising trio of pure bred fillies were seen at pasture grazing away and becoming more valuable each day as they advance in age and weight.

The Homestead Shropshires are well known to our readers. We could not resist the temptation to make a hurried inspection of the flock, which has been culled down to about 20 as well covered, typical ewes as one could find in any Canadian flock. There is not a weak one among them and at the head of the flock is a Cooper ram of high quality that is the sire of some particularly choice ram lambs which are now ready to send out to improve some lucky farmers' flocks.

Logan Bros. have carried the Holstein breeding fiery torch for upwards of fifteen years. They still intended to go on carrying it. In their discount sale advertisement they offer our readers the opportunity of helping to carry the fiery flame of Holsteinism to the remote by-ways and hedges of Nova Scotia, New Brunswick, Prince Edward Island and Newfoundland.

The Prince Edward Island Central Farmers' Institute in Annual Convention.

The second Annual Central Farmers' Institute or Farmers' Parliament of Prince Edward Island was held in Charlottetown on Oct. 15th and 16th.

Three meetings were held in the Market Hall and one in the Prince of Wales College.

Rev. Dr. Gauthier, President of the Institute, occupied the chair and presided throughout the entire series, except at the meeting held in Prince of Wales College, when Hon. Premier Matheson officiated.

Mr. Walter Simpson, of Bay View, the energetic Secretary of the Institute, was kept busy recording the various discussions.

The opening meeting took place at 2 o'clock on Tuesday afternoon and about fifty delegates from the various local Institutes and kindred Agricultural organizations throughout the Province were present.

...The minutes of the 1911 Annual were read and after some minor additions had been made they were adopted.

Prof. Theodore Ross reported for the committee appointed last year to inquire into the feasibility of having a canning industry established in Prince Edward Island. The Department at Ottawa had replied to the committees' enquiry by referring them to the bulletin of Canning fruits and Vegetables which contained a great deal of information which they were seeking.

Enquiries for information from various Ontario canneries had been forwarded by said canneries to their parental head, the Dominion Canneries, Limited, who replied that they had investigated the feasibility of establishing branches on Prince Edward Island and had come to the conclusion that certain local conditions militated against the profitable operation of such an industry.

Mr. A. E. Dewar, a prominent Island fruit grower, who had made a study of the question at issue was called on and stated that he did not believe the Island was ready for a cannery. He believed an evaporator would be more suitable. The cultivation of small fruits for canning purposes was expensive and the prices prevailing at the canneries was very low in comparison to the high quality required for the manufacture of a first-class article. He would not advise any Islander to put money into a local cannery proposition at present as he believed it would be a losing game.

He himself was experimenting this year with the canning of plums of which he had a large crop and for which he had no market—the result of which experiments he had yet to see.

The Committee on Weights and Measures reported that the law specifies that produce be sold by weight and that it was up to the farmers to stand shoulder to shoulder and demand that the buyers use weights instead of measures as is so commonly done in some sections of the Island.

The Treasurer's Financial Report showed a balance of $72.04 on the right side of the ledger.

After the appointment of the Credentials, Resolutions and By-laws Committees, Dr. Gauthier delivered an optimistic address in which he reviewed the various agricultural events that had transpired since the time of last annual meeting and pointed out some of the pressing needs of the immediate future. One of the pressing needs was the inaugurating of a system of women's institutes. He reviewed the disposition made of the resolutions passed at last years meeting. The desire expressed in the car ferry resolution was seemingly about being granted as the work along that line was progressing favorably. The resolution re good roads had been brought before the government and the demand was very urgent for widening the roads to the regulation width, the cutting of noxious weeds growing on the road-sides and the smoothing down and clearing of unsightly conditions wherever they existed on the road limits.

The dog tax resolution had been complied with. The experimental farm had been enlarged and standing fields of grain competitions and seed fairs and sheep sales had been held. He also referred to the proposed short courses and to the fact that the government had already purchased the rink at Charlottetown to be used for that purpose. He also referred to the various agricultural officers that had been appointed to carry on the good work in their respective branches and while they were all good men, tried and true, he hoped to see some of Prince Edward Island's own sons fitting themselves to accept these responsible positions, for patriotism like charity begins at home. He would refrain from dealing with the dairy industry as it would receive all necessary attention at the hands of the Dairying Association. The quantity of beef produced was not enough and something should also be done to stem the degeneracy of the Island's light horse breeding interests. He recommended the formation of local seed clubs, the extension of the provincial exhibition prize list to fourth, fifth or more places to encourage some of the smaller breeders, the selling of produce in car lots and eternal vigilance in maintaining the purity of seeds.

When farmers have seed of such quality that it may court inspection and stand the most rigid tests then, and only then, can farmers demand their price from the buyers and feel reasonably sure that they are masters of the situation.

He contrasted the educational features of the fall exhibitions and the seed fairs and let the audience draw their own conclusions as to which gave the most value for the money expended. In closing the president said a very material change for the better was being evidenced by farmers in enthusiasm regarding their own profession.

The various members of the Island Institutes had a mission to perform, they had a doctrine to preach and as the apostles of old had spread the lea-

ven that is christianizing the world. So would each and every progressive farmer help to upbuild Prince Edward Island.

Mr. Leighterizer inquired re the disposal made of a resolution passed last year asking that owing to the fact that P. E. I. poultry men are not permitted to place their birds on the second day of the winter fair that the P. E. I. Government is requested to withhold a portion of the grant donated to said fair. The resolution had been inadvertedly overlooked. A further discussion on this subject resulted in voting down of the resolution.

A resolution supported by Rev. J. McDonald, of Grand River, J. H. Gill and others asking that the government proceed as rapidly as possible with the widening of the public roads to the regulation width was unanimously adopted.

Peter Brodie favored the extension of the exhibition prize list as the smaller breeders could scarcely get any encouragement when only two or three places were allotted in each class and these were usually captured by the experienced show men. In order to provide for this extension he suggested that the Federal department be asked to grant the Island fair the sum of $2000 each year instead of $10,000 every fifty years. A resolution in line with Mr. Brodie's suggestion was drawn up and heartily approved by the Institute. Mr. Brodie thought it was very unfair to exhibitors of live stock who go to the trouble and expense of fitting their flocks and herds and bring their various animals out to the fairs in a creditable condition to be limited to only one prize when there is no competition. Under present conditions a breeder does not know whether he is to meet with competition or not and the extra expense of shipping and attending to extra animals during the fair is enormous.

A resolution asking the Government to put aside a fund from which the owners of sheep killed by dogs might be reinbursed was unanimously adopted.

THE TUESDAY EVENING MEETING.

was held in one of the Prince of Wales College class rooms. Premier Matheson occupied the chair. Education was the subject for discussion.

Premier Matheson believed the public schools of the Island were far from being satisfactory and some speedy remedy was badly needed. He solicited the unbiased opinion of the Institute members as to how the desired result might best be accomplished. Bettering the educational system of the Province merited the unanimous support of each and every good thinking citizen.

He had recently returned from a tour of Western Canada and had returned home more convinced than ever of the magnitude of the Island's developed and undeveloped resources. The bane of the Island province was the spirit of pessimism which was far too prevalent. It was responsible for a great many of our young people going away from home. He spoke of the comforts and luxuries of life on the Island compared with those of the West. Islanders should aim to put such excellency into their goods that they could court rigid inspection.

In conclusion the Premier announced that a modern equipment for the raising and loading of mussel mud was about to be installed.

Rev. Dr. Gauthier referred to the value of a trained intellect. He deplored the decadence of many of our rural schools. The case should be diagnosed and the proper remedies applied. The dearth of available teachers was getting to be a serious question. Well trained teachers were in demand and if rural schools would have their services they must pay them a living wage. He believed that teathers in some of the rural sections were receiving less money today than they were a quarter of a century ago. The West appreciates education and was offering high inducements to our best teachers and if we would retain their services we must pay them good wages.

Walter Simpson, a school trustee for over a quarter of a century said it was a gamble to get a good teacher now-a-days and it was particularly difficult to retain their services. There were many apprentices in the field but farmers should go down into their pockets and subscribe salaries that would pay for expert services. There was no question of more importance than the education of our young people—and education that will broaden their intellect and develop a manhood and womanhood that would lead to useful citizenship. Island farmers were prospering, their prospects were brightening and they should do their utmost for the cause of education.

Mr. Edmunds said the Central Institute would help the farmers to make use of their opportunities. That Prince Edward Island was producing good eduactionalists was proved by the fact that there was a demand for Island trained teachers in the West. There were resources around our doors and shores that called for development. There was an excellent opportunity for the development of the pork industry but packing conditions were very unsatisfactory and Island farmers should take a leaf out of the experiences of the Danish people in respect to developing the pork industry. Horace Wright considered the education of children should be everybody's first consideration. He would like to see agriculture given a more prominent place in the rural school curriculum. He welcomed the move for the holding of short courses and would like to see them grow to three months courses in the Prince of Wales College.

(Continued on page 50)

The Nova Scotia Horticultural Exhibition

The Horticultural exhibition at Bridgetown representing the fruit producing areas of Nova Scotia was not an unqualified success. From point of time and weather it was sandwiched in between two weeks of the best weather we have had this fall, but we fell upon evil days.

Exhibiitors left the picking and gathering of their exhibits for Monday and Tuesday of exhibition week and it rained so that about 48 per cent. of a total splendid entry of 43-00 materialized because it rained Monday and it rained Tuesday and wept Wednesday, on Thursday it sulked with more moisture while Friday the spirits of the weather alternated between grave and gay with a considerable amount of tears—even the fakers lost heart and money. And in one of the lulls of Wednesday's rain Premier G. H. Murray accompanied by his good wife, O. T. Daniels, Atty. General, A. L. Davison, Federal member for Annapolis Co. and Principal Cumming arrived at the building to open the exhibition.

The speakers were;—Principal Cumming who spoke of the past and future of the N. S. Horticultural Show, praised the display of exhibits and went on to outline some of the work in injurious insect eradication undertaken by the Province.

A. L. Davison, M. P. spoke of the possibilities of orcharding in Nova Scotia and compared her favorable with any Province of the Dominion.

Hon O. T. Daniels spoke in his usual happy and optimistic vein of the agricultural and horticultural awakening in Nova Scotia and predicted a great boom in the near future.

Premier Murray favored the small county exhibitions and felt that they were doing a good work in the county in which they were held. He spoke strongly of the splendid and varied resources of Nova Scotia. She was just waking up. He was sorry to see some of her sons leaving her but glad to see many coming back with a determination to spend the rest of their lives in their native province.

He then declared the exhibition open.

The exhibits that arrived were good and the arrangement was praised by all who saw it and we have to thank the old professional exhibitors such as Starr, the Johnsons, D'Almaine, B. F. Chesley, H. E. Burt, and a few others for giving the public something to look at.

The plate stuff was really a creditable show though the fruit was not colored as well as could be wished. A. C. Starr, H. D'Almaine, Arthur and H. Johnson, Kemp Chesley and Burt of Annapolis carried off most of the prizes in plates.

The box and barrel exhibit lacked competition and was not particularly well put up.

One exhibitor from Hants Co. had four bbls. filled with No. 3s. and culls which he bragingly exhibited for competition and kicked like a steer when the judges turned over the stuff instead of feeling asha ed for putting such trash in an exhibition.

When a man fills entries where he thinks there will be little competition with any kind of trash he can pick up easily for the sake of making a dollar he should be barred from exhibiting for he is more of an injury than a benefit.

The package itself in both barrels and boxes was rougher and poorer than ever. The old birch hoop and rough stave and head spoke ill of progress in attractiveness or appearance.

In attractiveness the N. S. apple barrel is decidedly off and it really mititates against us commercially.

In the general exhibit the barrels were more carelessly packed than in Kentville a few years ago. The barrels were not properly tailed nor were the boxes well filled and tiered.

There was an entry of 290 bbls. and 210 boxes but only about 30 per cent. of the entry filled and perhaps it was just as well as the carelessness in packing and rough appearance of package did not add to the excellence of the show.

The exhibit of the United Fruit Companies of the Valley competing for the fifty dollar Royal Bank prize was one of the best features of the show. These were packed intelligently and attractively. Some fifteen companies competed and as the entry called for three barrels and three boxes of colored export apples this made about a 90 package exhibit which was given a corner of the building by itself and attracted unusual favorable comment.

This prize was offered for competition only among the co-operative apple packing associations in the hope of stimulating the idea of box packing among the associations. It is to be hoped that the great bulk of our apples in the future will be handled by our co-operative fruit companies and the increasingly stringent enforcement of the fruit marks act will compel our orchardists to grow a higher quality of fruit and consequently to use materially the box as a package for export and sale.

Plums were a good exhibit as were the pears; most of the prizes going to Chesley Starr, Johnson, D'Almaine and Bent.

Considering the fact that most of the vegetables had to be gathered in the rain of Monday they were a very good exhibit—here again Chesley was a prominent exhibitor with Col. S. Sparr out with a number of good entries.

In vegetables the average exhibitor has yet to learn that the large, coarse specimen is not the one to win prizes and where there are medium, typical, smooth and uniform specimens in an entry.

The poultry exhibit, as a result of a very antiquated prize list which was dug up at the last moment after the printer had lost the one furnished for the firize list, was not very inspiring as far as numbers went—though there were some good birds. The white Wyandottes of F. G. Palfrey, of Lawrencetown, and Chas. Strong, of Bridgetown, were worthy of a place in any poultry exhibit.

The strong feature of this horticultural show was Ladies or Domestic Department. Mats, sofa pillows, centre pieces, all kinds of bed quilts adorned the walls, hung from the ceiling and strung in fantastic festoons from the beams, fancy work every where in bewildering and heaped up confusion.

The judge first appointed looked in awe at the array and demanded a coworker and finally these two appointed a third. And how the womens fingers itched to get hold of and finger that fancy work. A horticultural show with bed quilts and tea coseys in proximity to apples!

We hope that this year's failure will make an end of this kind of exhibition in our province. As a stimulus to better fruit growing its influence is nil. As an advertisement of Nova Scotia's capabilities in fruit growing its fame does not extend beyond the Valley in which it was held.

Nova Scoria as an apple producing country is beyond the plate or sample exhibition and now we want a horticultural exhibition held at Halifax at a later date with a prize list calling for colored entries and giving prizes worth competing for.

Below are given some of the principal prizes and prize winners:—

Royal Bank prize, fifty dollars, open to co-operative associations for the best six packages of commercial export apples, 3 bbls. and 3 boxes—won by the Waterville Fruit Company

20 sort collection of apples—Sea View Farm, Starrs' Point.

10 sort collection of apples—Sea View Farm.

Best plate Kings in show donated by F. C. Whitman, Annapolis Royal, won by Whitlock Marshall, Clarence.

Silver challenge cup offered by Chas. White and Hall won by Ralph Duncanson, Falmouth.

E. D. Smith prize of fifty apple trees for best barrel of Baldwins grown on Smith's trees—won by J. A. Kinsman, Lakeville.

Hon O. T. Daniels- prize of $25.00 for best boxes of fine commercial apples won by G. W. Banks, Paradise.

Prof. Cumming's prize of $10.00 for best bbl. Gravensteins in the show—won by Harold Robinson of Berwick.

Best collection of fruits from any farm—won by B. F. Chesley, without competition.—R. J. M.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuanee is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

DATES OF ISSUE.

November 5-19
December 10-24

A GOOD INVESTMENT.

One of the best investments that a father or other interested party can make for his son or any young man is to furnish him with the necessary amount of capital required to give him a course at the Nova Scotia Agricultural College.

The Maritime Provinces are now experiencing an era of industrial development the like of which was never before known in their history. The natural resources at every hand are being developed, new centres of population are springing up, trade channels are being improved, and new lines of industry are every day being established. The result is that the consuming population is increasing with much more rapidity than is the producing population. Our markets are second to none in Canada but yet we find a great many farm products that can and are being grown to perfection in the Maritime Provinces, imported from abroad just because the home grown supply is not equal to the demand. The natural sequence is that thousands of dollars are annually sent out of our provinces that could well be retained at home.

Maritime soils cry to her sons to take advantage of their heritage. One young man who remains at home and helps to improve the agricultural conditions of his surroundings is worth more to his home district and country than half a hundred young men who leave home to work in distant cities.

The Maritime farmers are coming into their own, they are awake and it is fair to see the evidences of improvements at every hand. It is good to see farmers coming victorious out of the rut of scrub bulls, scrub cows and scrub ideas about farm equipment to a higher pitch of farm civilization. The result is grand as it means dollars to these farmers whereas under the antiquated systems the result was not infrequently a minus quantity.

It is a pleasure to drive through sections of the Maritime Provinces where the farmers are alive to their opportunities and the magnitude of their calling. Their buildings and fences are in good repair, the cattle, sheep, horses and other classes of live stock show that they are well cared for and that the owners are looking to their production as a source of revenue.

But how long will this last? These farmers cannot keep up their work forever. Who is going to take their place? Are they raising sons and educating them in advanced farming ideas? Who is going to keep this beautiful country up, or to improve on its present gauge in the future?

Is anything being done to inspire the children of these farmers with a sense of loyality and pride for all this grand so that they will carry it on and keep it up when their fathers are gone.

The splendid redemption of a country from what was its former condition, ought to be preserved. It can only be preserved by the farm boys taking up the work of their fathers. Will they do it? Will their fathers give their boys the kind of education that will hold them loyal to these grand farms? Or will the boys flee to the towns and cities and leave these farms to go down under ignorant tenant management? Such has been the fate of some splendid farming districts in the Maritime Provinces.

On Tuesday, November 5th, the next session of long courses at the Nova Scotia Agricultural College will begin. We know of no place where a young man who purposes following an agricultural career can spend his time and money to better advantage than at this college. Give your boy an agricultural education and the answers to the foregoing questions will surely be as you would have them.

Now if you are a father or a mother, ask yourself the question, "Why am I working hard?" Are not all of us, who are fathers or mothers, working hard to feed and clothe our children and to give them a little better chance than we had?

Ask yourself also, "When is the best time for me to make a little extra effort to give my boy that better chance?" Is it not, when he is from 16 to 20 or 25 years of age?

Spending on him the paltry sum to give a full course of education at the Agricultural College will be worth more than if you give him ten times that amount when he is over 30 years of age.

A year in college is more than seven months of study. A boy learns many things outside of the class room. He learns to speak in public. He learns to write articles. He hears addresses from prominent men from all parts of the country. Most important, he makes friends of a hundred or more boys who have been brought up as he had, and who with him will be the leaders in agriculture in Canada in the next quarter century.

Give your boy a chance when he can take it.

THE NOVA SCOTIA AGRICULTURAL COLLEGE.

The next session of the Nova Scotia Agricultural College, Truro, N. S. will begin on the fifth of November.

A farmer's son attending the college, can take a full course in the various branches of agriculture, horticulture, dairying, poultry raising, veterinary science, etc., and at the same time in English, mathematics, book-keeping, political economy, the various sciences and other lines regularly studied in high schools and colleges.

While the college is supported entirly by the Government of Nova Scotia, tuition is free to the sons and daughters of Prince Edward Island and New Brunswick. Some day in the near future we hope to see the Provinces of New Brunswick and Prince Edward Island join hands with their sister Province, Nova Scotia, and together help to make for Maritime Canada one of the strongest Agricultural Colleges on the American continent.

The time is not ripe for an agricultural college for each province. The revenues are not sufficiently large to give three colleges a working capital, but the three provinces working together could well speed the work so well begun and carried on at Truro.

The teaching staff of the college are men who have the best interests of the Maritime Provinces at heart and who,, were it not for that fact, could now be occupying more lucrative positions offered them by some of the other provinces and states, west and south.

We have no hesitancy in saying that a young man who takes a course at Truro can recoup, by combining science and practice, the extent of his yearly college course expenses, every year over and above the present earning capacity of the farm.

THE SHEEP SALES.

Last spring Hon. Martin Burrell, Minister for Agriculture appropriated the sum of $15,000 to the Dominion Sheep Breeders' Association for the purpose of stimulating sheep breeding interests in the Maritime Provinces and in British Columbia.

The Association decided that the best way to encourage the sheep men was to buy a large number of pure bred rams, of the various popular breeds most suited to the respective localities, and also a number of high grade ewes and have the whole lot parcelled off and sold at public auction at convenient distributing centres.

In order to ascertain the breeds needed and the approximate number required, the Minister asked Col. R. McEwen, a successful Ontario sheep man to come to the Maritime Provinces. Associated with him on the commission while touring New Brunswick was Col. H. Montgomery-Campbell, President of the Maritime Stock Breeders' Association, who is an enthusiastic sheep breeder. The Minister also sent Mr. C. M. McRae of his own department. Mr. McRae has travelled the Maritime Provinces very extensively during the past ten years on institute work as judge at our exhibitions and is as conversant with the conditions prevailing in the Maritime Provinces generally as any man in Canada. While touring Nova Scotia the commissioners had H. W. Corning, M. L. A., Secretary of the Canadian Guernset Association, who is also a successful sheep breeder, associated with them to represent his province.

When they went to Prince Edward Island, Mr. Roy Curtis joined them to represent the Island Province.

Mr. Harding, a prominent Ontario sheep breeder, was delegated to buy the number of rams and ewes called for in the Commissioners' report. He made a canvas of the various prominent flocks in Ontario and some of the larger Maritime flocks and made a personal selection of the various animals offered for sale. In order to get some of the required animals, Mr. Harding was obliged to go across the line and make draughts on prominent Illinois flocks. With the exception of a few animals, that went somewhat off their feed while in transit, the rams, as a whole were a good useful lot.

Jas. A. Telfer, acted as auctioneer and Messrs. Harding and McRae were on hand to give the breeding of the respective sheep.

It was not the intention of the Minister that any fancy amounts exacted from the farmers. All that was looked for was that the sales realize part of the expenses, and that the aftermath in increased interest in sheep breeding would amply repay the outlay.

Owing to the fact that the dates of sale were poorly advertised, the attendance at the various centres was not very large.

The ewes were a good useful lot and the greater majority of them went into good hands. With a little extra care until they beco e acclimitized they should next spring bring forth a lusty lot of lambs, which when ready far the market, should bring the respective owners the prices paid for their dams at the sheep sales.

We believe the sales will have the desired effect as the rams and ewes were sold at prices within the reach of all.

WHAT COLLEGE FOR BOYS?

"Just two kinds of boys attend college—those who come and those who are sent." So spoke the president of an agricultural college. "With the former the faculty have no trouble. Such boys mean business, and, as a rule, they make their mark in the world.

This thought should be of great assistance to the farmer confronted with the question: Shall I send my son to college? College may be the making or the marring of a career—so may staying upon the farm. Every normal father desires the welfare of his children. How decide? Watch the boy! Give him a chance in the direction his taste naturally lies. Many a boy cut out to be a merchant fails because his parents won't give him a chance. Many a boy fails as a farmer because he should have been a blacksmith or a lawyer. His heart is not in the farm, therefore he cannot succeed. Every normal boy is by nature better equipped for some one thing than for anything else. Here is the father's cue. If the son has a mania for making things cultivate and educate that mania.

The boy will largely train himself up to a certain point. Then if he wants a college education enough to work his way more or less he may safely be trusted to make a start. If he is half-hearted about being sent, it is not safe to send him. The safest college for such a boy is the agricultural college, because he will there associate largely with farmers' sons, and be in contact with farm subjects. Should he return to the farm he will not have departed so far from the farmers' line of work as he would had he been sent to a different kind of college.

Exercising Good Judgment.

Editor The Maritime Farmer;—

In your issue of Sept. 10th you have an editorial entitled "Good Judgment" in which I was somewhat interested because it applied to me as well as to many other farmers in this Province.

It is not always the fault of a man's judgment that he is often a failure as a dairy farmer or more broadly speaking in all branches of agriculture in which he is engaged. It may have been an error of judgment that nine-tenths of the farmers in this country took up the calling of their father's, or left some other vocation to engage in it, who have raised their families and fed and clothed and educated them, with the result that after all the years of toil and hardship, he has little or nothing to show in the shape of bank accounts or securities. Perhaps this farmer would like to have owned a ern machinery, a more comfortable house, and more commodious barns. was it an error of judgment that he did not have these? It certainly was not. The plain, bald truth of the matter was, he could not afford to have them, his good judgment came to his aid right there, he knew that if he mortgaged his farm to buy tested cows, and improved machinery (much as he wanted them) the probability was that some day the farm would go to pay for it. So in that case "the last state of this man would be worse than the first."

It is not always the man with the best judgment who seems to succeed the best, nearly always he who succeeds the best has the fewest drawbacks and the most money to start with. Did you ever notice what a great difference a little money, for instance, makes in a business enterprise of any kind. You have noticed how quickly a man goes under when he starts in business of any kind without capital in these strenuous lines, poor judgment you say.

I have known farmers to start in life without a dollar, buy their farms and pay for them as they went along, and a high rate of interest as well. Raise a large family and educate them as best he could. What about that man's judgment? I think his judgment something colossal, or he never could have pulled through. You will admit that the men who are in positions of responsibility on our Experimental Farms and in our Agricultural Colleges are possessed of good judgment, or they would not be where they are. Put those men on a run-out farm, without any money and how long would it be before that farm was paid for, its fields producing abundant crops, its pastures stocked with tested herds of cattle, a beautiful house and grounds and modern barns. Mr. Editor would they live long enough to accomplish it? I know they would not if they depended on their own energies. The success or failure of a farmer is not merely a matter of good or bad judgment as often as it is his environments. Place some of these so-called failures on their feet with a few thousand dollars and they would prove a huge success.—W. S. Poole Charlotte Co., N. B.

The Sheep Industry in the Maritime Provinces.

PRINCE EDWARD ISLAND.

THE sheep industry is an important branch of agriculture on Prince Edward Island. The soil and the climate are highly adapted to sheep raising, as evidenced by the quality of many of the Island flocks and the excellence of the mutton produced. As in other provinces, the numbers decreased during many years prior to 1906, when some improvement was shown. The returns for 1911 indicate an increase of about 8 per cent over 1906. Both wool and mutton have so materially improved in value that flocks are increasing in number and enlarging within themselves as rapidly as the natural increase will allow.

While many of the flocks have white faces and long wool, the use of Down sires is becoming very popular. The close fleece of the grade Down is well suited to the moist climate of fall and spring, and the compact carcasses are admirably adapted for the market requirements. Provincial census returns show that of the thousand head of pure-bred sheep on the Island about 55 per cent are Shropshire, 15 per cent Leicester, 5 per cent Cotswold, 5 per cent Oxford and the balance Southdown and Lincolns about equally divided.

The soil, a light red loam, naturally dry under foot, is admirably adapted for sheep. It is easily worked and when well farmed produces abundant crops of all classes of sheep fodder. Hay, oats and roots do particularly well, and with these foods sheep may be grown to perfection if the foundation stock is right and intelligence is exercised in breeding and treatment.

Island agriculture is suffering from the constant growing of hay and oats without adequate returns of manure. If these foods were fed to sheep and turned off as mutton and wool the fertility of the soil would be rapidly increased until in a few years the poorest farm would be yielding profitable crops. The foundation stock may consist of young healthy ewes of any grade or colour of face preferred or obtainable. If on these ewes pure-bred sires of good mutton form are bred and the produce well cared for, the males wethered and the females fattened for the market, a valuable yearly revenue would be secured from the flocks, against which there need be comparatively little expenditure for labour and buildings.

From 1902 to 1906 between 13,000 and 14,000 lambs were shipped each year, while in 1907 and later years the number had increased to upwards of 20,000. A prominent Charlottetown butcher reports that the carcasses were on an average from 7 to 10 pounds each lighter in 1907 than previously. Prices have been steadily advancing. Some years ago lambs were bought at $1.50 each, and only the best taken. The price per pound was 2 cents for all over 60 pounds. In 1907 as high as 5½ cents was paid for ewe and wether lambs over 70 pounds and one cent less for rams. These prices have since then been maintained. In spite of this great difference in price the percentage of ram lambs was about 10 per cent greater than in 1906, when one dealer deducted $572 for rams, while the following year the farmers of the Island lost $2,000 on their lambs from reduced price alone, to which may be added many hundreds of dollars from loss of weight. The dealers do not want to handle ram lambs at all, and the sooner sheep raisers realize this and guard against it the earlier will their industry prosper. The value of lambs shipped to the American market in 1906 was about $65;000; with the increased price and increased number about $75,000 worth were sent over in 1907. During the past two years much of the exports have been to Western Canada. If sheep raising were undertaken earnestly and conducted in a business way by the general farmers of the Island, the agriculture of the province would rapidly increase in prosperity.

In order to encourage the sheep industry the Live Stock Branch of the Federal Department of Agriculture in co-operation with the Provincial Department of Agriculture held auction sales of pure bred rams at central points on the Island in the autumns of 1908 and 1909.

NOVA SCOTIA.

No province of Canada is better adapted to the production of mutton and wool than is Nova Scotia. In that Province there are over a million acres of pasture land, a great deal of which is sandy, rocky or gravelly, rolling up-land. Much of it is covered with short, nutritious, native grass intermingled with white clover, yielding a rich herbage upon which sheep thrive exceedingly well. Soil and climatic conditions in Nova Scotia are extremely favorable for the growing of summer, fall and winter sheep feed, such as grass, rape, roots, clover and mixed hay. As sheep require less grain feed than other classes of farm stock, they are particularly well suited for a province where the growing of cereal crops is not now and likely never will be a very strong factor in its agriculture.

Near the sea, where the weather is at times damp and foggy, a compact medium sized sheep, with a close, dense fleece, is better adapted than a sheep with a more open fleece. In sheep, as in any other stock, good results seldom come by chance. It requires steady, persistent effort to attain the end in view. When pure-bred compact males of one breed are used and a continuous fixed course of breeding followed, in a few years a very ordinary flock will be so changed that they will have the conformation and appearance of pure-breds.

With the price of lambs at five cents per pound, weighed out of pasture, and tub-washed wool selling at 25 cents a pound, a very common ewe between fleece and lamb returns the Nova Scotia farmer from five to six dollars a year. With good breeding, careful selection and liberal feeding, no branch of the live stock industry in Nova Scotia is more profitable than sheep raising. The neglecting of two points in sheep management, however, causes serious loss: ram lambs are not castrated, and too often the ticks are not destroyed. Lambs should be castrated when between ten and fifteen days old; this would add at least 50 cents to the value of the lamb, as then they need not be disposed of so early in the autumn. If the practice of castration became more general it would relieve the market of becoming glutted in the fall, as so often happens when too many ram lambs are crowded on

No flock can thrive or do well if to it.

the ewes and lambs are pestered with ticks Early in June is the best time to get rid of these pests. About ten days after the ewes are shorn the ticks will have taken shelter on the lambs. If the lambs are then dipped it will be the means of so thinning out the troublesome vermin that the flock will thrive in peace and contentment.

In destroying noxious weeds and keeping tillable land clean, there is no other method so easy as that of pasturing with sheep. In Nova Scotia, particularly, sheep have a peculiar value in this regard. The weed known as ragwort has become a serious menace to cattle raising in the province by causing Pictou cattle disease. Sheep relish this weed, and receive no injury from it. From experiments carried on for years under the direction of the Veterinary Director General on an infested farm, it would appear as though sheep if allowed would in time entirely exterminate this plant. Apart altogether from the advantages of rearing sheep in large numbers as a profitable branch of agriculture, for the purpose of making it possible to conduct the rearing of cattle successfully, the keeping of sheep in the ragwort-infested district cannot be too strongly urged.

For a score of years ending 1904 sheep rearing in the province gradually declined, the falling off amounting to 10,000 head. Since then an improvement has taken place, more particularly in eastern Nova Scotia and Cape Breton. At present the number is about 385,000 head. The census for 1901 shows that there were killed and sold sheep and lambs to the value of $119,756. At that time however, the price of mutton was very low. The annual wool clip is a little more than one million pounds. Of pure-breds there are in the province about the following numbers: Shropshires, 600; South Downs, 80; Leicesters, 80; Oxford Downs, 100; Dorsets, 30; Hampshires, 11; Lincolns, 20; Cotswolds, 100.

In the falls of 1906 and 1907 there were taken to the province by the Provincial Department of Agriculture a large number of pure-bred rams which were sold at auction. In the autumn of 1908 the Live Stock Branch of the Federal Department of Agriculture made similar distributions by holding auction sales of high-class rams in districts that were more or less infested with the weed, ragwort, that had been proven by experiments conducted by the Health of Animals Branch to be responsible for Pictou Cattle disease. Sheep destroy this weed by feeding upon it with no injurious effects upon their health. The educational side of the sheep industry is being pushed at farmers' meetings.

Nova Scotia has over a million acres of pasture land. Owing to the roughness of the surface much of this must remain in permanent pasture. Great tracts of it are on bare, bleak, wind-swept hill sides where dairy cows or even young cattle could barely exist, but where sheep would do fairly well. The most practical way of renovating cropped out land, bringing it back to a profitable state of fertility, is by sheep farming. In some parts of the province there are far too many deserted farms upon which a fair living could be made if sheep raising were made the principle factor in their working. To buy up or lease a number of cheap farms, going into sheep raising extensively, would, if judgment and skill were used in the management, give the owners a better return and a much safer investment than purchasing land in distant countries.

Nova Scotia has a number of well managed woolen mills. The quality of their goods have a Dominion reputation. The development of the sheep industry would give them a larger supply and a better quality of raw material.

There are a great many reasons not mentioned why the sheep industry of eastern Canada should be stimulated and encouraged. It is well worthy of careful consideration.

NEW BRUNSWICK.

While the agricultural sections of New Brunswick are devoted largely to dairy farming, there are many sections of the province admirably adapted for sheep raising. According to the latest census returns the province has one cow for each two acres of pasture land, and where organized dairying is the leading industry there is little reason for largely extending the keeping of sheep. On rugged, or rolling land not already returning a profit from cows, the sheep stock might well be greatly increased.

The mutton produced in New Brunswick, as in the other Maritime Provinces, possesses a grain and flavor of unusual excellence. This fact is recognized by many of the best paying markets, with the result that buyers from Boston and New York are early on the ground each autumn contracting for lambs for the fall trade. Western Canada has also entered the field for New Brunswick lamb, and early each summer, western dealers olace orders with local buyers for shipments to be supplied during the

(Continued on page 65)

HORTICULTURE.

How an Apple Orchard Gives an Annuity of $20,000.

Thirty years ago, when I was fifteen, my father, S. P. Chute, bought a farm of one hundred and seventy-five acres for $1,400 in South Berwick near the centre of the Annapolis Valley. At that time only twelve acres were cleared and it was in grass cutting five hundred pounds to the acre; the remainder was bushes and rocky pasture land with a low meadow, cutting six to eight tons of coarse grass.

At the age of sixteen, the full control of this farm as described above, was passed over to me with a mortgage for its full value. At first I turned my attention almost entirely to small fruit. The twelve acres of cleared land was set with apple trees obtained from a nursery man anxious to sell his stock. Hence he gave me until orchard came into bearing, to pay for same. In this young orchard, for six years I grew strawberries, raspberries, blackberries, and some currants and gooseberries, with profitable results.

Among the trees obtained from the nursery man was one plum tree, which yielded three pecks for the first crop and netted four dollars. The extra ordinary result from this tree led me to purchase one thousand plum trees which were planted among the apple trees as fillers. While these plum trees were not as profitable as the first one, they gave very satisfactory results for twenty years, when they were cut down to make room for the growing apple trees.

The good care which I gave the apple orchard gave a good profit, and this led me to see the splendid opportunity in orcharding. And being blessed or, as most people thought, cursed with acres of wild, rocky land worth not more than eight to ten dollars per acre, and considered of no value for agricultural purposes, I continued to clear this land and to extend my orchard, generally growing my own nursery stock, but when necessary supplementing it by outside stock.

THE ORCHARD GAVE 4,000 BBLS.

As a result of this in 1904 I had sixty acres planted with apple trees, many acres of recent planting, and the yield that year was six hundred barrels. In 1905 it yielded one thousand barrels. In 1906 it yielded one thousand barrels. In 1907 it yielded two thousand barrels. In 1908 it yielded one thousand five hundred barrels. In 1909 it yielded four thousand barrels.

Then the prospects of fruit grwoing looked so promising that I purchased some thirty acres of young neglected orchard and by giving it proper fertilization and cultivation, I augmented my crop; so that in 1910, the year of universal failure to fruit growing on account of late frost, the crop was twelve hundred barrels, and in 1911 it was eight thousand barrels, and the prospect this year bids fair to again reach that number.

THIS IS A GOOD ANNUITY.

In the last two years I have planted over one hundred acres, making my present holdings over two hundred acres, containing about 20 thousand trees. From this orchard, before ten years, the average crop will be about twenty thousand barrels, yielding a net income of $20,000.

When you consider that an acre of bearing orchard in the Annapolis Valley is worth one thousand dollars per acre—the fact has been proved by actual results that an acre of bearing orchard gives from ten to seventeen per cent. of that valuation—the present value of my farm is equal to any gold mine. And during the past year, I have had tempting offers of nearly one hundred thousand dollars.

The question will naturally arise, "How have these results been obtained on land naturally too poor to grow profitable results?" My stock has consisted of only one cow, and teams sufficient to cultivate the orchard. But, while raising small fruit I learned that a commercial fertilizer could be depended upon to produce good crops, as well as to increase the fertility of the soil. So, contrary to the advice of friends, for thirty years I have extensively used commercial fertilizer, and many acres of my orchard have never had a shovel full of barn-yard manure, and to-day they are producing enormous crops. But the man who uses commercial fertilizer must also use cover crops or the result may be disastrous.

HOW I CULTIVATE.

My method of orchard culture has been to grow hoed crops between the trees for six or ten years, and then to give up the land fully to the orchard and cultivate it once a week during May and June, at the last cultivation seeding to vetch or clover. The fertilizer is sown before the first harrowing. I use principally acid phosphate, bone meal or basic slag for phosphorous acid; muriate or low grade sulphate of potash for potash; and depend on cover crops of vetch or clover for the nitrogen. I use for one acre, from five to eight hundred pounds of fertilizer containing phosphorous acid, and one to two hundred pounds of potash, according to the land, size and number of trees. I sow forty pounds of winter or hairy vetch; sixty pounds of summer vetch, or fifteen pounds of clover, to the acre. After the leaves have fallen I plow the orchards. This lessens the amount of spring work, and in the spring I began harrowing as soon as the frost permits. By this method the harrowing is done much earlier than when the plowing is delayed until spring, and the orchard receives more thorough cultivation.

All the trees, which I last set out, have been on the system of close planting, using such varieties as the Wagners, Williams' Favourite, and other early bearing varieties, for fillers, with the idea of cutting these out when the trees became too thick. However, after experimenting on five acres for four years, I am convinced that we can keep the full number of trees for many years with excellent results, providing the trees are kept low and well headed in— about fourteen feet high and the same in circumference is the limit. This saves in pruning, in spraying and in picking. But the regular pruning of such an orchard must not be neglected or failure is sure. To prove the profitableness of close planting and heading in, I give the results obtained during the last four years, from the five acres of orchard containing seven hundred trees.

Groaning Beneath a Load

An Emperor Apple tree in the orchard of H. G. Lyons, Berwick, N. S.

BEARING AGES AND RESULTS

9 years out, 250 bbls, which realized $625.

10 years out, 175 bbls., which realizeh $437.

11 years out, 500 bbls., which realized $1500.

12 years out, 250 bbls., which realized $500.

This year the trees are now (July) bending with the fruit, and there is every indication that the crop will exceed any previous record. I consider that the crop of five hundred barrels practically paid for the five acres of land, and for all that I have spent on the orchard. The small fruit which I grew on this land being additional profit.

5 acres of land @ $100	$500
Ploughing and harrowing 11 years @ $30 per year	330
700 trees @ 20 cents	140
Setting 700 trees at 5 cts. each	35
Fertilizer at 50 cents per tree for 11 years	350
Applying fertilizer	10
Cover crops, $2.00 per acre per year	110

Another acre, also close set, at the age of fifteeen years gave two hundred and fifty barrels which sold for five hundred dollars.

THE LABOR QUESTION.

With the large increase in my orchard, the labor question soon grew to be a great problem. At first I boarded the laborers in my home, but soon found that life was not worth living under these circumstances. So at intervals, eight cottages were built, where the men and their families live. This method has proved very satisfactory. At one time in four of these houses there were forty inhabitants, —grandmothers, fathers, motherd and children. The younger children pick berries and the older ones pick apples in the fall and pack them in the warehouses during the winter months, thus giving them employment the whole year.

We have frost-proof warehouses situateed at the railway stations, with capacity for ten thousand barrels. We pick and put into barrels from trees, then haul to the warehouses where they are packed. We ship early varieties early, but the later ones we held until winter.

Being situated within eighty miles of the English steamship line, we can defy the world for competition. For instance, with the event of the fast mail boats calling at Halifax we have shipped apples and landed the same on English markets in eight days. Comparing this with the twenty or thirty days taken in transporting Western fruit, and considering the additional cost of transportation, we need not worry over Western competition.

Fruit-growing should be extended still more. Practically the only limit to this industry lies in the people, not the conditions of this valley.

Another great advantage to fruit growing is the co-operation among the growers. The co-operative movement is growing rapidly. During the last few years some thirty companies have been formed under a special act of parliament called the "Fruit and Produce Act." Each company consists of some thirty or forty farmers who own the warehouses. Here the fruit of all the shareholders in each warehouse, is packed and shipped un-

What is a Good Roof?

Is it something like this? A roof that can't catch fire from burning embers. A roof that will wear as long as good cedar shingles used to wear. A roof that isn't going to be an expense for repairs. You get everything that makes a high-grade roof when you buy

NEPONSET PAROID ROOFING

Over 3,000,000 square feet have been used in the Panama Canal work. Leading Railway Systems are also big users, including the Canadian Pacific. Bought everywhere by farmers for high-grade barns as the best roofing value on the market. A big warehouse roofed in 1898 was torn down last summer with the NEPONSET Paroid roof in good condition. This is the roofing with a record. Make sure that you get it. Sold only by regularly authorized NEPONSET dealers, leading hardware and lumber merchants.

If you have young children you have perhaps noticed that disorders of the stomach are their most common ailment. To correct this you will find Chamberlain's Stomach and Liver Tablets excellent. They are easy and pleasant to take, and mild and gentle in effect. For sale by all dealers.

der one brand, and the expenses and profits shared according to the amount of stock each farmer owns, and the number of properly packed barrels of apples from his orchard.

CO-OPERATION AIDS FARMERS.

During the past season, by a further act of parliament a Central co-operative Association was recently incorporated, with which thirty of the local associations have affiliated, subscribing some twenty per cent. of their capital, thus giving this Central Association fifty thousand dollars capital. This association handles the entire crop of the thirty local associations, by selling and consigning the same; also in buying supplies such as fertilizer, pulp-heads, nails, etc., to great advantage. For example, forty-one thousand dollars worth of fertilizer was bought for cash, thus saving ten thousand dollars over the price formerly paid to local agents.—S. B. Chute, Berwick, N. S., in Farmers' Magazine.

Fruit Growing in the Gulf Garden.

In the Gulf of St. Lawrence and separated from the mainland by the Northumberland Strait, lies the Province of Prince Edward Island— "the low and beautiful land" that Cartier saw on the afternoon of June 30th, 1534.

"All this land is low, the most beautiful it is possible to see, full of stately trees and goodly meadows, which abound in white and red gooseberries, strawberries, blackberries and wild grain like rye."

It is situated north of the 46th parallel of latitude and is very deeply indented with arms of the sea so that no part of it is more than eight miles distant from the shore.

The surface is gently undulating and in places rolling and the purest of water can be obtained almost anywhere at less than thirty feet. The highest elevation is less than three hundred feet. The soil is a bright red loam, passing into a stiff clay on the one hand, and a sandy loam on the other. It rests on an open subsoil, affording good natural drainage.

The climate is moist, temperate and even, not subject to extremes either of heat or of cold. Showers are frequent throughout the summer. The location, soil and climate all combine to make Prince Edward Island the "Garden Province of Canada." I believe Prince Edward Island to be one great site for an apple orchard," said Professor Macoun.

"Almost the whole Province is suited for orcharding, and the rest of it will do for cranberry growth. With these two industries the whole country should be covered."

Up to the present time very little has been done to develop fruit-growing. Nearly every farmer has set out enough apple and cherry trees for home use, but in most cases those have been neglected. There are, however, about a dozen commercial orchards, five acres or more in extent, upwards of ten years of age, and several more have been planted within the last few years. It is very difficult to obtain figures giving accurate returns of any of these orchards. It is generally expected, however, that a tree ten years of age should produce a barrel of number one apples. Mr. A. E. Dewar, of Charlottetown Royalty, has had an average of one and a half barrels each, from an orchard of Wealthy trees at this age.

It is generally conceded by those who are in a position to know, that in color and flavor, apples grown in Prince Edward Island excel. The Autumn varieties are also good shippers, as they mature about two weeks later than elsewhere. The crop is sometimes injured, but seldom ruined by late frosts, the proximity of the ice flow retarding the period of blossoming until this danger is past.

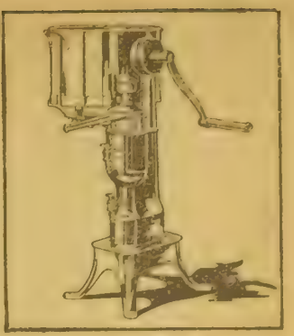
Both Cream and Skim Milk Are Delivered Pure and Clean



GOOD reasons are the basis of all buying. It follows then, that the best buyer is the man who has the best reason, or the most good reasons for buying. When this rule is applied to the purchase of a cream separator and each separator on the market is carefully studied for reasons why it should be chosen, the most careful buyers invest their money in

I H C Cream Separators
Dairymaid or Bluebell

Assuming for the sake of argument that the best separators are equal in skimming capacity, simplicity, and durability, there is still one best reason why your choice should fall on an I H C separator. The reason is—the dirt arrester chamber which is found only on I H C separators. More or less foreign matter is very likely to find its way into the milk before it reaches the separator. The I H C dirt arrester chamber removes every particle of this matter before separation begins and holds it imprisoned until the last drop of milk has passed through the bowl. Both your cream and skim milk are delivered pure and clean.

There are points in the construction of I H C separators, such as the heavy phosphor bronze bushings, trouble proof neck bearing, cut-away wings, dirt and milk proof spiral gears, etc., which taken in connection with the dirt arrester chamber, make I H C separators beyond any doubt the best of all to buy. There are four convenient sizes of each style. Ask the I H C local agent for demonstration. Get catalogues and full information from him or write nearest branch house.

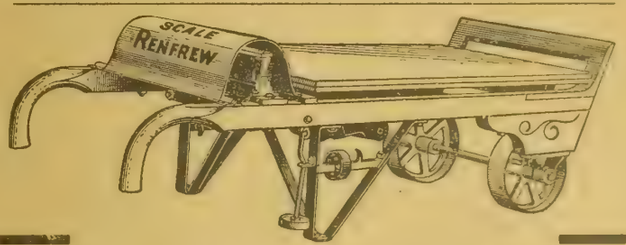
"WHEEL THE SCALE TO WHAT YOU WANT TO WEIGH"



THE "RENFREW" HANDY TWO WHEEL TRUCK SCALE

Saves Money For Farmers and Dairymen

Thousands of farmers are losing money yearly through the inaccuracy of their scales.

It was to protect the farmers against these losses that the Renfrew Truck Scale was designed and built.

And it does protect them,—by being absolutely accurate.

Gives the farmer ALL-his profits on everything he sells by weight.

Saves for him time and labor,—simply wheel the scale to what you want to weigh.

Weighs everything from one pound to 2000 lbs.—and weighs it right.

To verify these statements:

DAIRYING.

Holsteins Best in Wisconsin.

Last year a cow-testing competition was held in Wisconsin in which prizes amounting to$1600 were offered for the herd of ten cows showing the best results at the pail and churn for the period of twelve months. Ten purebred Holsteins owned by John Erikson, carried off first prize with the remarkable average of 16044.4 lbs. of milk and 509.69 lbs. of fat, equal to 637.1 lbs. of butter. As Mr. Erickson bred all these cows, or all but one, from two families, fed and developed them into the best working herd in his state, some extracts from this report to Prof. Woll are both interesting and instructive. He says;

"To get a large production from cows one should commence with the development of the calf. It should never be stunted and should be induced to eat a great deal of roughage quite a while before the first calving. I feed so as to have them in good flesh and physical condition. At the first milking period it is very important to get a long milking habit fixed, that with right handling she will never forget. To be punctual in time of feeding and milking is important, and one should not change milkers any oftener than is necessary.

When my cows were in competition they were fed and milked three times a day till about eight months before freshening, when they were fed and milked twice a day, the time being divided as nearly equal as possible in all cases. They were fed 20 to 35 lbs. silage a day and we got them to eat as much timothy and alfalfa hay as possible.

"The grain ration consisted of bran, oats, hominy, oil meal and Ajax Flakes. These feeds were proportioned according to time of year, and also length of time the cows were along in calf. The amount fed was ten to fifteen pounds a day, sixteen pounds to a couple for a short time in a seven day test.

"Each cow was closely watched, and fed the amount she would clean dp and make use of both for production and body maintenance. After having finished the morning's feed, they were given a small handful of salt. If anything was left it was cleaned out of the manger before they were given their next feed. They had water in reach at all times supplied by a system of buckets. When not in pasture they were gone over once a day with brush and card.

"Five of the first prize ten cows were members of my Princess family, which foundation I purchased fourteen years ago, and from which I have bred ever since. They number half of my herd. They are of a strong dairy tendency and of dairy type.

"Four of the prize ten cows were of my Daisy family, which I have been breeding for the last thirteen years. They are also strong in dairy lines. Two cows of this family won the prize for two daughters of the one cow, averaging 12.83 lbs. fat."—G W. Clemons.

The Scales and Babcock Tester.

Wherein should the ability to judge be supplemented by the scales and babcock tester? This is a question which should have the earnest consideration of every breeder and dairy farmer.

Is the cow that leads in the show ring always the best producer? Many men believe that they can accurately judge the worth of their cows without going to the trouble of keeping records. Are they right? Can they keep in mind, for the whole year the production of each cow? Can they judge as to the amount of butterfat each cow produces? Can they accurately estimate the net profit made by each cow? Are they keeping some cows that do not pay for their feed? Should a breeder breed his stock for show ring purposes alone or should he breed for production as well? Should not every dairy farmer consider such questions as these?

To be a successful breeder a man must be a good judge of stock in order that he may breed toward a certain type or ideal which he must have in mind. He must be a judge as to their strength of constitution, their feeding capacity, breeding capacity and conformability to his ideal, but behind all this more is necessary. It is essential for the breeder or dairy farmer to know just what each individual cow in his herd will produce for the amount of feed she consumes.

The measure of a cow's real dairy value is the net profit she makes over and above the cost of feed. In order to measure such value it is necessary to reach a standard and the only fair standard is the number of pounds of butter-fat. By weighing to get the quantity of milk and testing to get the per cent. of butter-fat it is quite easy to find the pounds butter-fat produced by each cow. Then taking into consideration the cost of feed we have the net profit made by each cow. The poor ones may be culled out. The good cows kept and the heifers, selected from these.

Let not pedigree alone govern the man who is about to buy. The pedigree is valuable only in telling of the ancestry of the animal in question. Let the buyer demand a knowledge of the production of the ancestry If one believes in the theory "Like begets like" he should know that the animal he is about to buy is from a strain of producers.

Let the breeders breed for production as well as for show ring purposes. Let the dairy farmers breed and weed for production and the dairy stock of this country will be improved.—H. N. Flewelling, Sussex N. B.

Systems of Providing Feed.

The dairy farmer may make use of any one of four systems, any combination of the four, or all of them together, to provide feed for his herd: Pasture, soiling crops, silage or all purchased feeds. As to which system is the cheapest depends a good deal on how he is situated.

One might say at first thought that the pasture was the cheapest, but such would only be the case on comparatively cheap land. Two hundred dollar an acre land at a dollar an acre rent per month for say six months, would not pay an ordinary rate of interest on the investment, to say nothing about the taxes, upkeep of fences, etc. Even at $2 an acre rent it would barely pay the interest.

Take the same acre put in corn, and with good care it should yield twelve tons of silage, the value of which would be not far from $50. And the yield mentioned is undoubtedly a conservative estimate. Twelve tons per acre is somewhat above the average yield, but is even considerably below what the yield should be on good land intelligently handled.

So we may take twelve tons per acre yield as the low figure, especially compared with figures given by Mr. F. S. Peer in his book on Soiling, Ensilage and Stable Construction, in which he states that a very good yield would be thirty tons per acre, on which basis he estimates the full cost of production at $1.20 per ton.

Supposing the cow were fed silage the year round, an average of 30 lbs. per day. She would consume in a year less than six tons. In other words, the acre yielding twelve tons of silage would feed two cows for a full year, while the acre in pasture could hardly be expected to feed more than one cow for about six months. The acre in pasture, then, at $2 per month rent would be worth $12 with no net profit, while the acre in corn would be worth at least $50, or more as the yield was increased, at a cost of about $15, or a net profit of $35. Ofcourse the labor cost of feeding the cow daily in the case of silage is an item to be considered, but this would be more than offset by the manure saved by keeping the cows up.

In order to keep up the milk yield at its maximum a certain amount of mill feed will need to be fed whether the cows are on pasture or are kept up on silage or soiling feeds. The soiling system is one requiring more intensive methods and works successfully on high priced land and does not require large areas, but because of the great amount of labor required throughout the summer months, it is a system that is not widely used.

With the silo employed for summer feeding the bulk of the labor is done at filling time, when, in about a week's time, as good a milk producing feed as can be found, is placed in the silo where it may be fed from rain or shine, winter or summer with equal uniformity and the minimum amount of labor.

If the dairyman is going to milk cows and buy all of his feed, he may be able to make a profit by buying in large quantities and by having an exceptionally good market for his product.

Milk Signs and Actual Tests.

There is a growing appreciation of the cow-testing associations of this and other countries, the best evidence of which is the establishment of organizations in new territory, the growth of the old ones and the constantly increasing interest in the results these associations obtain.

In Germany for 16 years past tests have been conducted to determine, among other things, the difference between cows freshened in spring, and those in fall as to their milk producing capacity, the relation of high yield age to the percentage of butterfat and the correlation of form and function.

It was found by the tests that cows freshening in the winter months gave a larger flow of milk during the lactation period then beginning than when freshening in the spring. When cows produce a large flow of milk the tests indicated that a small percentage of the milk was butter-fat, but there was no appreciable change in the content of fat as cows increased in age. By carefully judging the animals on points of conformation to the dairy type as it is known in Germany, and then comparing the conclusion of the judges with the results as shown by the milk sheet and the test for fat it was concluded that a rather close relation existed between actual performance. In all there were 3,000 registered cows concerned in the inquiry and the milk production of these animals varied from 2,724 lbs. per year to 13,218 lbs., the average yield for the 16 years being 6, 816 lbs. containing a content of butter-fat of 3.64 per cent.

Dairy Notes.

Poor cows are never cheap.

If butter is oversalted or overworked, its delicate flavor is ruined.

The good dairy cow eats largely, digests amply, milks abundantly.

Handling butter beyond what is strictly necessary does more harm than good.

System in the dairy should surpass all other matters on the farm.

An even and proper temperature of the cream gives texture and solidity to the butter.

The energies of the dairy cow are convertible into a profit almost every day of her life.

Cream ripened too much will make sour butter.

For Your Wife's Sake Get an Easy-Running, Easily-Cleaned Separator

A BUSY FARMER cannot always be on hand to turn the cream separator for his wife. But if the cream separator is a

Standard

his wife will not require the services of a strong, husky man.

The makers of the STANDARD have built a separator that any woman can easily turn. A strong arm and a strong back are not necessary to make the STANDARD go. A little energy goes a long way with this machine.

The low supply can of the STANDARD also makes it essentially a woman's separator. If given her choice, no woman would prefer to pour a pail of milk into a supply can at least one foot higher than the STANDARD'S.

Your wife will prefer this machine, too, on account of its sanitary features. Milk from any source cannot reach the neck-bearing. The gearing, too, is enclosed, and is therefore dust-proof. The discs can be cleaned in a minute's time without the use of a brush.

The "Standard"

But get the STANDARD Cream Separator Catalogue and learn all about the world's greatest separator.

Requisites of Feeding.

The age of miracles is past. It was a beautiful day in May that a corn seed was buried in the earth. The sun shone warm and bright. Through natural chemical and physical action water and heat were absorbed, transformation took place and the small kernel increased in size and altered in character, the dormant germ became active, a new life began. A sprout and rootlet put forth. The blade appeared, then the ear and the full corn in the ear. A generation of the corn plant, one of the most common life cycles on the farm. Begun a wonder, continued a wonder, ended a wonder. How little do we actually understand of the commonest natural functions and processes that are always operating about us. Yet we do know that definite natural cause occasions every effect. This is a world of definite cause and direct effect, never a chance occurence. The vegetable is subject always to law and order; so also is the animal.

In the feeding of the dairy cow three elements of equal importance present themselves at once—the feed, er, the feed and the fed. Some one was asked, "When ought the education of a child begin?" and replied "One thousand years before its birth." The natural and acquired characteristics of the cow are of first importance to the feeder. We assume that she inherited health and strength and that in her development neither were impaired, and that she is approaching cowhood possessed of these natural attributes and the dairy function to a paying degree. Let me inject right here that of all discouraging tasks none is more disheartening than trying to make a poor cow make good.

Cow comfort is of very great consideration. We must first make our cow happy; she must be contented and at peace with all the world. I will not attempt to enumerate all things that enter into this state of being, but certainly we may list good water and plenty of it, good air and plenty of it and a good bed, a warm stall, salt ad lib, good sanitation and cleanliness. Kindness and gentleness should be insured to every cow, and let regularity be printed in large type and posted everywhere in the barn and outside.

We have an army of efficient scientific men who are delving into the mysteries of all subjects appertaining to the dairy. May their tribe increase Others who are collecting, arranging and publishing knowledge for the benefit of the great horde of us who labor to aid the cow in her endeavor to furnish mankind with wholesome udder products. But how neglectful we are to avail ourselves of this invaluable knowledge! Twice each day do we accord the humble cow her rations, but how many times monthly do we think to perfect Bossie's menu in accord with known standards of her requirements? Let us digress.

Our cow's body is composed of flesh, bones, hair, hoof and horn. Her tissue is daily being worn out and exhausted; every part of her anatomy is constantly undergoing this same breakdown. We must provide the material with which she may replace this waste to prevent emaciation and death. The urine excreted from the animals body represents a large portion of this body-waste. This, the chemist informs us, is largely nitrogenous and mineral matter plus water. Again, the animal moves about, eats, chews her cud and digests her food, and maintains a body temperature usually above the surrounding atmospheric temperature. This energy and temperature implies burning or combustion of something. A part of this fuel consumed is body tissue, a part is not; but in either case the fuel must be provided, and its source is the daily ration.

The animal's economy is powerless to create substance; this daily loss must first be made good, or we have a loss in weight—all bodily waste must be supplied in the feed. The mineral waste need not give as serious concern, since all of our ordinary cow-feeds contain the minerals needed, save salt, and in sufficient quantities. The nitrogen waste, noted in the urine, and the feed-fuel consumed in making energy and heat, are of vital consideration. Nitrogen is never found alone, and in its combinations with other elements, as found in foods, is conveniently classified as proteids. Those chemical combinations in the foods which we class as the fuel formers are carbonaceous, and are called carbohydrates. Our firewood is largely carbonaceous; it is this constituent part that affords the heat in burning. Oil will also burn, and with an even hotter flame. The scientists have told us that all cattle foods contain this carbonaceous part, and also in smaller quantities and varying amounts, oils or fats. One unit of this latter in the cow's food, the wise men have determined, is worth two and one-half units of other carbohydrates as fuel.

They also have told us after years of most careful study how much of each element the aver age cow needs daily per 1,000 lbs. of live weight. We have been told how much the cow needs and how much any food contains. We have a standard showing protein, fat and carbohydrates in the right ratio, and a ration figured to this standard is called a balanced ration. With this standard, we have also a table composition of all feeds, also our stock of feed; therefore, with paper and pencil, can we not calculate the proper ration? Is not dairying thus simply a mathematical problem? Should a cow now ever have gray hair? How pleasing, beautiful and restful are some dreams! But, alas, how frail and erroneous are some!

It is just here that science deserts us. By no known laboratory process can the palatability of a feed be told and any successful combination of feeds must be relished by the cow. She must look forward eagerly to its coming and relish the entire meal. Some feeds, when analyzed, reveal worth, but lack palatability, hence are not appetizing to the cow. Therefore, if we would use these, we must mask them with some other very inviting food. There is but one way to determine the palatability of a feed, and that is to ask the cow.

We conclude from all information available that the cow's natural food is grass. Here we find a very happy combination of palatability, digestibility and succulence. Let us in ration forming never lose sight of these and especially do we emphasize succulence. There are very many cows green feed is wanting several months whose habitat is cast in regions where of the year, but through the use of silage and roots the requisite succulence is both possible and practicable.

Three elements more should always be mixed in the feeding. They lack in digestibility, are wanting in succulence, and palatability they have not, but their practicability makes their employment imperative. I refer to lead pencils, scales and the dollar-sign. What is the whole world to a man if his wife is a widow? What if we know all and apply all known chemistry of feeding, but our ration costs more than the cows can pay for? The chemist is our friend and answers for us every question, but the court of appeal in every feed problem is the cow—ask the cow. Every cow is an individual, with definite, pronounced likes and dislikes. Know thy cows.

The reader may want three sugar lumps in his tea, while the good wife prefers but one. Uncle Bill drinks his clear, while Aunt Jennie has just a drop of milk, no sugar, and a little hot water. The children, of course, do not drink tea. What hostess but consults the preferences of those about her table? Does she not rather provide the "makings" than season a whole pot of tea and serve all from the common stock? Cows are very human. They, too, have preferences. These must be ascertained and catered to. Their palates must be tempted, then tickled. To obtain the desired information, ask the cow. Watch her as she feeds. Pile several kinds of feed separately before her. Observe which is eaten first, which last. Appetite quaestions are easily answered, but we are not done with the problem then Because a man likes rich cake, is it good for him? The feeder must be quick to observe and long on wisdom. We frequently observe cows, for illustration, that eat

(Continued on page 65)

WINDSOR DAIRY SALT

Is The Cheapest You Can Use

not alone, because it is the purest and best salt for salting butter. But **because it will salt more butter, pound for pound, than any other salt you can use.**

The big creameries will tell you this—and show you tests to prove it.

The Agricultural Colleges demonstrate this every day.

Every farmer and dairyman—who is getting good prices for butter—is using Windsor Dairy Salt.

It is pure—it makes beautiful butter—it works in quickly—and it is the cheapest in the end. Just try it yourself.

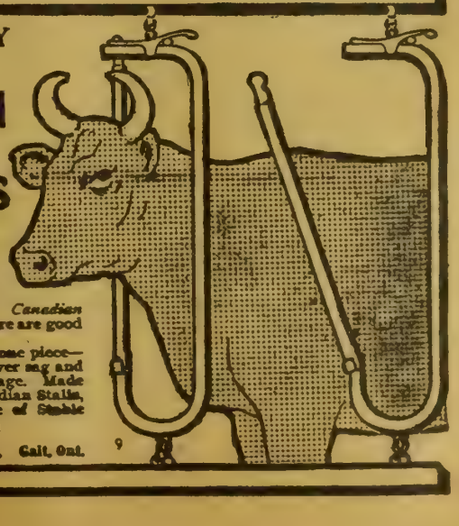
FACTS—NOT THEORY —ABOUT

O.K. CANADIAN U-BAR STEEL STANCHIONS



When big stables like the Central Experimental Farm at Ottawa—the new barn at Silver Spring Dairy Farm, Ottawa—the Brindale Farm at Toronto—are equipped with *O.K. Canadian U-Bar* Patented Steel Stanchions—there are good reasons for it.

O.K. U-Bar Steel Stanchions are of one piece—have no rivets or joints—therefore never sag and stand up against the most severe usage. Made in 5 sizes. We also make O.K. Canadian Stalls, Water Basins and a complete line of Stable Equipment. Write for catalogue.

Canadian Potato Machinery Co., Limited, Galt, Ont.

The Prince Edward Island Central Farmers' Institute in Annual Convention.

(Continued from page 43)

Peter Brodie followed expressing similar sentiments.

Superintendent of Education Campbell set forth a plea for more optimism and paid a high tribute to the Island teachers. There were many young men and young women with lots of ability for teaching and all they needed to encourage them was to appreciate their services by paying them wages in proportion to the wages paid elsewhere for their services.

Prof. Ross thought the efforts of the teachers was not fully appreciated. He dealt with the reasons why so many young people leave schooi before they complete the prescribed course and backed his statements with a review of some investigations conducted by Cornell University in regard to the question.

He also referred to the splendid classes of live stock available for demonstration at the short courses.

Rev. Fr. McGuiggan set forth a plea for more sympathy between ratepayers and teachers. Parents and guardians ought not loose sight of the fact that it is their duty to encourage the teacher by visiting the school and taking a kindly interest in its welfare.

Inspector Baxter gave instances of woefully small salaries that had come to his notice. If the Government would inaugurate a better scheme for the payment of teachers, even if they went down to defeat at an ensuing election, on account of any unpopularity incurred in this respect, they could not die a more glorious death if through their act the cause of education had been benefitted.

Rev. John McDonald thought the Island schools were not in as deplorable a condition as some of the speakers pictured. He thought the teachers in the various schools were every consideration. ...
doing their very best and deserved

Dr. Ross said it was a short-sighted policy for parents or guardians to keep their children from school for trivial reasons and that the statute of compulsory attendance of at least three quarters of the time the school is open should be enforced.

Mr. Seaman, Principal of the Prince Street school set forth a plea for better home training, industrial education and a higher wage scale.

Commissioner of Agriculture McKinnon thought the Island's present system of education favored the so-called learned professions rather than the farmers' profession. He called for the unanimous support of the Short Course plan and for a move to introduce more co-operation in buying and selling amongst the farmers.

J. A. Clark, Superintendent of the Dominion Experimental Station, eulogized the benefits occuring from short courses in agriculture and showed the avenues of opportunity open to those who take the long courses.

Mr. Cameron, a Rhodes' scholar spoke of the educational value of experiment stations and model farms.

Mr. Doble, M. P. P. would like to see more rural matters incorporated in the school text books. He also said a model young man as teacher had a great influence in developing the masculine side of a boys' nature

After a note of thanks to Premier Matheson for taking such a kindly interest in the meeting adjournment was made until Wednesday morning.

ON WEDNESDAY MORNING.

the claims of the Provincial and Central Seed fairs were set forth. The original seed fair had been started at Charlottetown but had been abandoned as it could not be made a financial success. The proposition was then tackled by Summerside and the results were so succesful that it was decided to make it an annual feature. Charlottetown was again prompted to try again so the Central Seed Fair was organized. Many persons looked on the central as a rival of the Provincial. The $400 grant donated for a provincial seed fair by the federal department had been equally divided last year on the understanding that the Central Farmers' Institute decide which fair would be recognized as the Provincial to which the total grant would go in future years.

Much ill feeling was anticipated on this question but the timely throwing of oil on the troubled waters by Rev. Dr. Gauthier and Father McGuiggan presidents of the rival fairs made the discussion a regular peace conference which resulted in the amicable settlement of the question by voting Summerside the federal grant and Charlottetown the local grant.

The conditions governing the $400 grant also called for a committee of nine Institute members to act as an advisory board to the seed fair management. Rev. Dr. Gauthier was empowered to appoint said committee.

A resolution asking that the Ottawa National Exhibition be held at a later date than in 1912 so that Island exhibitors would have an opportunity to exhibit was adopted.

P. J. D. Edmunds, Horace Wright and Prof. Theodore Ross were appointed a committee to investigate a co-operative pork packing proposition and submit their report to the various Farmers' Institutes on the Island so that the question might be intelligently discussed at a future annual meeting.

A resolution asking that the annuber of members required by statute to organize a farmers' institate be reduced from 30 members to 20 members was laid on the table.

A resolution asking for a move to standardize a price for various farm products was tabled.

A resolution asking that the annqal meeting of the Institute be held during the third week in November next year, the date to be fixed by the executive committee was adopted.

A resolution approving of the holding of short courses was passed.

ON WEDNESDAY AFTERNOON.

Dr. Gauthier thanked the ladies who had attended the meetings and a resolution asking the government to make provision for the organization of womens' institutes was unanimously adopted.

The election of officers resulted as follows:

President—Rev. Father Gauthier.

Secretary Treasurer—Walter Simpson.

Directors—Rev. Father McGuiggan, Walter Simpson and Peter Brodie for Queens County—M. J. Kelly, R. J. McLaren and Wm. Mullaly for Kings County and G. W. W. Cameron, Dr. Gauthier and Robt. Agnew for Prince County; the first named director in each group being vice-president for his county. The meeting then adjourned.

It was a pleasure to attend the various meetings and listen to the remarks of the various speakers. Their manner of address and adherence to parliamentary rules showed one of the great advantages of the education that comes through the practice of expressing ones opinions in the local institutes. If the younger men who are growing up will learn to express their opinions as lucidly as the various members of the Central Institute do they will not reflect any discredit on their education or training.

LIVE STOCK.

Lice on Pigs.

Recently W. G. W. wrote concerning the best means of getting rid of lice on pigs, adding, "I have a Middle White Yorkshire sow, and she is constantly pestered with these beasts, although I have tried means to eradicate them, but failed."

It is difficult to account for, because there cannot be recognized any such a thing as an inherited or breed predisposition, but experience goes to show that some animals seem more prone to harbour lice than others, and to be more difficult to free from them, just as some folks attract fleas while others are never troubled. This fact has given rise to the notion that some animals "breed lice," which is, of course, absurd, and while there may be something in the theory of a habit of body that is specially attractive to lice, difficulty in getting and keeping animals free from pediculi is invariably associated with imperfect dressing, failure to repeat it, and neglect to deal with the surroundings. What the average animal owner demands is a recipe for a dressing that will destroy lice, which he expects it to do in one application, and which he generally employs in a perfunctary fashion, and then, when the animal is found in the course of two or three weeks to be as badly infected as ever, he declares the recipe to be no "adjective good," and says nasty things about the prescriber or vendor. It is a great deal easier to prescribe or concoct a lice dressing than to get it properly applied. It is easy eoough to destroy mature pediculi; the difficulty is to deal with the eggs, or "nits," and provide against reinfestation. Some of the domesticated animals harbour several species of lice—the superior animal has three—but the pig plays the part of host to only one, and it is the giant of the family. It is namedHaematopinus urices, and it is the largest known species among the Pediculinae.

It is curious, but a fact, that there exists some difference of opinion as to the importance to be attached to the invasion of the skin of the pig by these large blood-suckers. They are sometimes found on pigs that are doing pretty well, and apparently causing them but slight inconvenience and from this it is, of course, but a step to declaring the presence of lice to be a sign that pigs are doing well. This is actually affirmed by some pig-keepers, but the majority are happily only too anxious to get rid of them, and recognise that lice, being parasitic, bite and irritate the animal so that it cannot rest comfortably and put on flesh. Whether a lousy pig does badly or not is very much a question of the numbers in which the parasites are present, but whether they be few or many, they cannot possibly be of any benefit to the animal, and it is simply foolishness to regard them as a sign of thriftiness. They are much more commonly a sign of bad housing, uncleanliness, and poor feeding, for poverty and lice generally go together, whether the subjects are pigs or bipeds. If poverty does not "cause" lice, as the popular method of expressing predisposition has it, lice very soon cause poverty, and, if they are allowed to increase, the pig-owner need not be surprised to find himself getting poor also, for lice cause arrest of development and loss of condition. Cases are on record of little pigs dying from anaemia and inflammation of the skin, caused by intense phthiriasis.

There is, as already hinted, no great difficulty in getting rid of pig lice, or of keeping the animals clear of them, if, in addition to repeating any dressing employed, once or twice, at intervals of eight or ten days, the bedding is cleared out and turned and the surroundings generally cleaned and disinfected. The spraying of the walls and roof with a solution of one of the well-known disinfectants, or the free use of fresh limewash to which some crude carbolic acid has been added, will tend to prevent reinfestation.

Some of the pig men get rid of lice by greasing the pig all over with lard. This is really a scientific method of slaughter, because the breathing apparatus of the louse is placed alongside the abdomen, and the fatty matter causes death by asphyxia by blocking up the organs of respiration. Neumann recommends cooking-oil, in which fish has been fried, as especially efficacious in the case of the pig. Rural visitors to the East End of London will appteciate the deadly character of this remedy from the smell. The fried-fish shop is, however, not an institution that flourishes where pigs are largely kept, and it will be found that a mixture of onepart of flowers of sulphur with four parts of lard or oil is even more effective. Some mix a ,ittle snuff with the lard, but tobacco in all its forms is dangerous to pigs, and its use requires caution. Another domestic remedy is a mixture of butter-milk and paraffin oil, but parafin, unless in small quantities and in perfect emulsion, is not a safe skin dressing for animals. A decoction of stavesacre seeds, made by boiling 1½ oz. of bruised seeds to each quart of water, can be recommended as an effective dressing. The animal should be wetted all over, commencing with the head, neck and extremities, by brushing the decoction into the skin. Washing with Spratt's dog soap is the method of destruction preferred by Mr. James Long as being "inavriably the quick effectual." Owing to the hair being thin, pigs are less difficult to wash and dry than any other animals on the farm, and for the same reasons greasy dressings are easier to apply. Whatever the agent employed, the dressing needs to be repeated in about the time stated above, in order to kill the parasites hatched from eggs or "nits," the vitality of which are not affected by any dressing that can be used without grave risk to the animal.—Pately Bridge in Farm and Home.

Fattening Beef Cattle for the Fairs.

In the few weeks that remain before the Maritime winter fair some fat can be put on the beef animals and the hide, hair and horns be much improved.

The first consideration is the selection of such types as will make good feeders and that when fitted will meet show yard standards. The ideal beef animal is low to the ground, broad and symmetrical with an especially deep covering over the back, loin, rump and quarters. The muzzle should be broad and full, indicating good feeding qualities; the face short, forehead broad, neck short, dewlap and brisket comparatively fine, shoulders well laid in and deeply covered, back broad, ribs sprung wide, loin wide and deep, rump long and wide, quarters deep and full, dressing percentage high, hide pliable and hair fine.

Choose animals meeting these requirements as nearly as possible and bring them gradually to heavy grain ration. Oats, corn, barley, bran, oil meal, cotton seed meal, roots, green oats and clover hay are widely used in beef fitting. Oats, corn or barley, bran and roots make a good ration. Green corn or oats or good pasture aid during the first few weeks of feeding. Clover makes an excellent roughage. The animal will have a better appetite, be not so liable to get off feed and put on firmer flesh if given exercise.

Frequent washings are advisable. Grooming will aid materially with hide and hair. The horns should be polished. First take off the outer dead covering with a rasp. Complete the operation with a pocket knife and emery paper. Oil with sweet oil and later polish with cloth and chamois skin. Long sled-runner hoofs must be trimmed. Cut them back and pare the soles until the animal stands squarely on his toes. Trim the long hair from around the base of the horns and over the poll and clip the tail, leaving a neat, medium-sized brush. Exercise enough with the halter that the animal will lead well, and, as with other show beasts, beef cattle should be taught to stand and stay in position. Presenting animals to the judge at their best, frequently makes the difference between standing at the top of or way down in the class.

There is a final finish or bloom that is recognized as the right condition for the show ring. This only comes on an animal in good health, rightly fed and excercised and forced for a long enough feeding period to have a deep, mellow covering of meat and with hide and hair fit.

Dirty Hog Yards.

Have you ever noticed the difference in the thrift of the animals in feed lots on neighboring farms where two farmers, apparently equally good feeders—as far as the rations which they fed—were engaged in feeding live stock for the market?

"Yes," you will say, "I have," and you will perhaps add, "but I don't know how to account for that difference, for Neighbor John feeds just as good as Neighbor Joe. In fact, I believe he feeds more grain to his hogs than John does. He never lets his hogs go hungry away from the trough, though of course Joe never does that, either."

That may be true, but haven't you noticed the difference in the condition of their feed lots? Look at the mud in John's feed yard where the hogs mutt wade about belly deep to get at the trough. The only dry spot in it is that far corner where the remains of an old straw stack afford them a dry place to sleep when it isn't raining. Then take a look at Joe's yard, nice and high and dry all over, with a good shelter back there for the hogs to be warm and dry in during any kind of weather.

"But can that make such a difference?" you may ask.

Yes, indeed! Feed is not all that the hog wants to make him grow sleek and fat. His comfort is just as important to him as his feed.—Wisconsin Agriculturalist.

Meat Piles Melting Away.

Another reason for regarding current hog prices as legitimate is rapid shrinking of meat piles in packer's cellars. No longer is the accumulation touted for bear effect.

During September the local stock of pork decreased 11,902 barrels, of lard 106,383 tierces, and of ribs 15,919,176 pounds. The figures tell how rapidly the stuff acrumulated by packers early in the year is being cashed.

With broad foreign and domestic demand for hog product no apprehension regarding winter action by the market need be entertained.—Chicago Live Stock.

Watering Cows.

More cows fail to give a maximum yield of milk from lack of water than from lack of food. At least 85 per cent of milk is water, and a cow that gives 58 pounds of milk a day must have at least 43 pounds (about six gallons) of water to put into the milk pail besides that needed for use in her system.

Just think of the foolishness of turning her into zero cold to drink two full pails of ice water and then expect her to do her best in filling the milk pail. Would it not be wise to have water before her at stable temperature, to drink at pleasure? Think it over.

"A merciful man is merciful to his cows." Is there any mercy in turning a cow out into a zero temperature, or below, and compel her to drink ice water? Did you ever stand and see that poor cow shiver and shake in the stable while warming up that ice water to the temperature of her body? Don't you know that no cow ever made a drop of milk when shivering? Wouldn't it be wiser, as well as more humane, to provide that cow with water before her at stable temperature?

Think about it.—J. S. Woodward in Maine Farmer.

What Shall We Do With the Calves?

The most important knowledge the farmer of today needs is that knowledge of absolute costs which will show him what crops are profitable for him to raise and which ones he should abandon as returning him no profit above pay for his labor and interest in investment.

By the light of such knowledge, many things we now do will remain undone, and the effect upon prices now prevailing will be tremendous.

For instance, this problem of the calf, rightly understood, will in most localities compel the selling of the calf when a day old, and, if all farmers should follow this custom, would eventually raise the price of good veal to a level where it would again become profitable to keep veal calves till four weeks old.

It is not profitable to do this in our locality under prevailing conditions.

For the sake of easy figuring, let us admit that the bother and labor of feeding the calf for four weeks is equal to the labor of milking the cow and caring for the milk—which of course it is not, but this is a minor cost, anyway, since the milking of an extra cow and the caring for her milk when she is only one of a considerable herd is but a trifle.

Now if the calf is kept and fed whole milk till four weeks old, it will sell for $10, or perhaps even $14 if especially good.

Let us put down $12 on that side of the account. On the other hand the calf will bring $1.00 when a day old, and we shall have the mother cow'smilk for 28 days. Say 16 quarts per day if a good cow—this makes 448 qdarts of new milk which in the summer time here will bring 9 cents per quart at the beach, or 8 cents per quart in the winter in the city, which makes the milk value at 8 cents total up to $35.84. To this add the $1.00 received for the calf when a day old and you have $36.84 from your cow by selling the calf when a day old, as against $12 by feeding the whole milk for the four weeks.

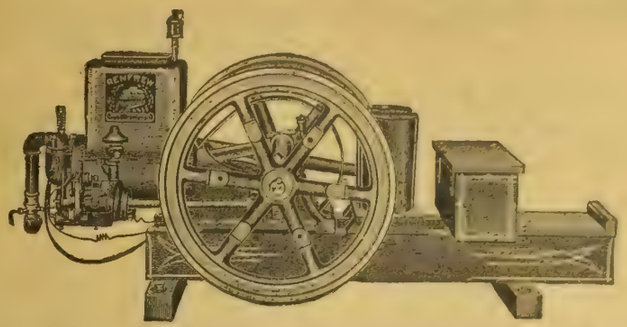
Now you will say that I can not get that price for my milk in my section, and I admit that in some places the market is not so good as is ours, so let us place the market value of the milk at 5 centsper quart, which totals $22.40 for the milk the four-weeks-old calf would have eaten. To this add the $1.00 the day-old calf would bring, and you have $23.40, against $12 in favor of turning the calf when a day old.

But you say, I do not sell milk, I have no market for it in my neighborhood, I make butter. Let us, then, figure this again. Your calf will bring $12 at four weeks of age, but the whole milk feed during this 28 days would make from a good new milch cow, say, 7 lbs. per week, 28 lbs. for the four weeks. Good butter here brings 35 cents per lb., especially good butter has brought within the past three months over 40 cents per lb.; but let us figure at 35 cents—28 lbs. times 35 cents equals $9.80. We then have, we'll say, 100 gallons of skim milk to feed to either pigs or hens.

At the present price of grain, this has easily a feeding value of 5 cents per gallon. The skim milk then totals $5.00 plus the $9.80 for butter, plus the $1.00 for the day-old calf, or $15.80, as against $12 in favor of turning the calf when a day old.

Now, again, heavy cream brings 15 cents per one-half pint jar, or 60 cents per quart during the beach season here. To be conservative, let us reckon a superior, extra heavy cream at 50 cents per quart. This same cow ought to yield 8½ quarts of such cream per week, or 35 quarts during the four weeks. This at 50 cents would total $17.50 for cream, $5.00 for the skim milk, and $1.00 for the day-old calf, or $23.50, as against the $12 for the four-weeks-old calf.

Will someone tell me wherein my figuring is wrong or how anyone can afford, at prevailing prices, to keep a calf till four weeks of age and feed same on whole milk? By just such deals as this we are getting beaten every year. Let us wait till four-weeks-old calves bring from $20 to $25 before we return to selling such veal, lest we wish to donate so much value to the poor meat trust and the friendless, down-trodden calf dealer.—R. W. Dow in Maine Farmer.



2 1-2 to 60 h.p. Semi-Portable, as illustrated; Stationary and Portable

Smooth, Steady-Running

is a strong feature of this engine. The parts are as perfectly balanced as a clock, so that even under a heavy load, the

Renfrew-Standard

gasoline engine does not jump or crawl around. It needs no fastening down. This perfection of balance also reduces wear to the minimum. You will get many years of long, hard service out of the Renfrew-Standard. And you'll like it, too, because it is so very easy to start. No cranking required. A little push on the wheel and away she goes. But to learn full particulars send for our Bulletin. This is the latest and best type of gasoline engine for sale in Canada.

The Right Building Material for Houses, Barns, Implement Sheds

Whether you are building an implement shed, a granary or a house or barn, the most ECONOMICAL and DURABLE building material is "Metallic."

For Barns: Corrugated Steel Siding and "Eastlake" Metallic Shingles make a barn absolutely fire, lightning and weatherproof.

For Houses: Metallic Rock Faced Stone or Brick Siding will give your house the appearance of a stone or brick dwelling. It is easily and cheaply applied and very durable. "A 25-year actual test" has proven "Eastlake" Shingles the best roofing.

All about the permanent roof you want is told in our artistic free booklet, "Eastleke Metallic Shingles." Write for it now."

THE HORSE.

Harness Accessories.

Cases frequently arise in which it is found expedient to use one of the various special pieces of gear or harness accessories designed to meet certain particular requirements and contingencies in harnessing horses, and it is well that a horseman should have some knowledge of these different contrivances, which include the so-called false collar, the breast or Dutch collar, the burr, nose-net, and false back-band, besides several other devices of more or less usefulness in certain eventualities. The first-named is probably the one most often seen used. Its name describes it pretty aptly, as it has the shape of a collar and goes underneath the ordinary harness collar, its object being to protect the skin on the shoulders when there is any special tendency on the part of a horse to suffer from collar galls or sores. A false collar acts practically the same part under the collar as a saddle-cloth or numnah does under a saddle. It is made either of leather or of felt, the former undoubtedly being the more practical. A long felt false collar is, however, oftentimes used, for it is a widely-held idea that because felt is such a soft and thick material it is specially effective in protecting the shoulders from the pressure of the collar; but, as a matter of fact, leather is found in practice to answer the purpose a good deal better. The objections to felt are, first, that it is unduly thick for being placed underneath the collar, and by reason of its thickness prevents the latter from fitting properly; secondly, that it is very hot; and thirdly, that it is practically impossible to keep clean for long, for sooner or later it gets very hard and dirty through becoming impregnated with the sweat and sebaceous secretions of the horse, when it not alone ceases to be of any use in affording protection to the skin, but actually becomes liable itself to cause the trouble which it is intended to prevent. A leather false collar, cut from a nice soft piece of leather of medium thickness, is free from these objections, while it is easily kept clean, and merely requires to be oiled at frequent intervals in order to keep it thoroughly soft and pliable. Of course, it is necessary to see that it fits well, and it must not throw any wrinkles or folds when the collar is placed over it.

A SUBSTITUTE FOR THE ORDINARY COLLAR.

A breast collar, which some people call a Dutch collar (the latter term being derived from the fact that it was copied from the Dutch, who almost universally employ this kind of collar in harnessing their horses), is used in the place of the ordinary harness collar, and it is principally resorted to in cases where the latter is found constantly to cause galls in the horse. There are occasionally horses to be met with that apparently cannot wear an ordinary collar without getting galled by it, and in a case of this kind the substitution of a breast collar is often the best way out of the difficulty, though a false collar may first of all be tried. In cases where a horse is suffering from galls or sores inflicted by the collar, a breast collar is also found to come in very useful for tem porary use until the shoulders are well again. This pattern of collar answers very well for light and even medium draught, though it is certainly not so efficient as the ordinary collar, because it does not distribute the draught so widely, but concentrates it on the breast and lower portion of the shoulders only. It is very usually worn with light American trotting harness, and in recent years has come to be increasingly used with the harness of show horses; in fact, the breast collar is now distinctly fashionable for show purposes.

A BIT REINFORCEMENT.

A so-called burr consists of a circular, flat, fairly thick piece of leather with a hole in the centre, and it is fitted round the mouthpiece of the bit at either end, close to the cheeks or—in the case of a driving snaffle—to the cheek rings. These burrs are chiefly used with the object of preventing the bit from being drawn through the horses mouth and also of increasing the effectiveness of the bit in making the horse turn to right or left, and they are undoubtedly useful for this purpose, though there is ordinarily no need to resort to them; but they come in specially handy when a horse is hard mouthed and does not readily obey the indications given with the reins when wanted to turn to either side. Burrs are also sometimes fitted to a bit for the purpose of obviating the possibility of the corners of the mouth being pinched by the bit where the mouth-piece and cheeks or rings join. The objection to burrs is that they look clumsy. When they are used one should be careful to have an extra wide bit, to allow for the room which they take upon the mouthpiece. If a bit is only just wide enough for the horse's mouth without the burrs, the fact of the latter being fitted on it will make the mouthpiece too narrow, and discomfort is in consequence caused to the horse.

TO COUNTERACT PULLING.

A nose-net, which is drawn over a horse's muzzle and fastened to the nose-band by means of small billets and buckles, is used for horses that pull much. It prevents the horse from opening its mouth, and it is for that reason that it counteracts pulling, though it will not usually overcome this trouble entirely, but serves merely to mitigate it. A false back-band is comparatively rarely seen. It comprises a thick, fairly broad strap, with a tug at each end, which is placed across the horse's back immediately behind the saddle-pad, the shafts of the trap being passed through the tugs or loops at its end. The idea of a false back-band is to have an extra strap to support the weight of the shafts, and which will serve to keep them up in the event of the real back-band passing over the saddle-pad giving way. The idea is perhaps somewhat far fetched, for with harness which is in proper condition and repair there should be no reason to apprehend that the back-band is likely to break. However, there are some who prefer to use a false back-band when a special strain falls on the real one on account of the trap or cart being heavily loaded.

OTHER CONTRIVANCES.

As coming within the category of accessories here discussed, mention may briefly be made of the following:—There are some horses which, owto an unduly tender skin, are specially subject to be galled or rubbed sore by the girth-band and belly-band of the harness on the brisket just behind the elbow. A rough and ready expedient adopted in such cases is to tie back girth and belly bands with a piece of twine, which is fastened to the breeching stops on the shafts, in order to keep them clear of the part where the skin gets chafed, but a special narrow strap is often used for this purpose, which, though it has no recognized name, is well known to

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR :--I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

POULTRY.

Hints for Molting Time.

Many of the hens ought to be pretty well along with their molting by this time, and many of them are, while the late ones are just beginning to shed their feathers in good shape. Some of these late ones might easily have been hurried along by what is termed the starving method, and would have very likely been laying steadily again when prices are highest. Many consider this a wise method, and perhaps it is, but one thing seems clear to me, and that is that hens which are forced either in laying or molting are shorter lived, or at least have a shorter productive period, and must be hastily disposed of and replaced by birds of greater vitality if one is to have a profitable flock at all times. There is doubt in my mind if it is not better, on the whole, to let nature take its course in these respects, going only so far as to provide suitable quarters and an abundance of well-balanced rations, without any attempt at forcing. The important thing is to make a good profit from every bird as long as they are fed and cared for. There are still widely-varied opinions as to how this may best be done, even among expert poultrymen. Perhaps the hens that are several years in wearing out their reproductive vigor pay best in the end.

At all events the hens require careful attention during the molting period, and specially careful attention to rations. It is best to feed considerable oily food such as linseed meal in the dry mash; in the south and some other localities this is called oil cake meal, and it is not well known by that name in Canada. At this time, fat meat also is good, provided it is wholesome and is not pork. Fat pork is no better for bird or beast than it is for man. At this time, also, corn ration may be somewhat—in fact, considerably—increased, without danger of over-fattening. The oil in the food not only softens the outer skin to which the quills adhere, but provides the material of which they are largely composed, and the feath will form and grow much more rapidly than when these materials are present only in small quantities. This is an important matter, for while it is in no way forcing the molt, it enables the birds to grow their winter coats and recover from the effects of this heavy drain upon their systems under the most favorable circumstances, and materially decreases the period of inactivity which always accompanies this change of plumage. It requires from two to three months from the time molting begins until the hens begin to lay again, for the important change to take place, and it is largely dependent upon feeding and other conditions, whether the period shall be long or comparatively short. I have a small flock of Indian Runner ducks which laid up to the middle of July, constantly, from the time they began in February. Then they began to molt and laid no more until the second day of Septembes, completing the molt and recovering their vigor in six weeks, under conditions which were as favorable as they could be made. Hens will show nearly or quite as good results from proper care, not only at this time, but at all times. These particular ducks are three and four years old, and have never before begun moulting until about the time they were through this year, and I am confident that they will now lay until well into the winter, for often they will not lay at all after molting time, until February, when they begin a new season's work.

It is necessasy that the biddies have plenty of green stuff, not only at this time, but at all times; but now this green stuff is turning brown and soon there will be nothing green for them in the garden. Lawn clippings should have been saved all summer, and in cold weather make fine green food by steaming and serving warm and moist, or may be chopped fine and used to good advantage mixed in the dry mash. Of course there are cabbages, mangel beets, blood turnip beets, carrots, rape and the like to be gathered for winter feeding, and all these should be carefully preserved, as nearly as possible in their natural state. It is also a good plan to gather as much clover hay as convenient, dry and chop it fine for winter use, and don't forget to gather a good supply of leaves for winter ,itter, for you are likely to need it.

Probably the dust bath has not been much used during the summer while the hens were out on the range, and very likely it is now deep buried in the litter. This same litter should be removed from the pens, which should be thoroughly cleaned, then whitewashed and a spray of zenolium or some other disinfectant equally good should be thoroughly sprayed into every crack and crevice, as well as over the entire surface of the interior of the pen until there is no doubt about its being clean and sweet Then the dust bath should be replenished with a fresh supply of road dust, and a good supply of dust should be put away for winter use, so the bath may be renewed occasionally as it needs it. It is not often done, but it is a pretty good idea to g ve the hens a dip in Kreso or some other good preparation, at the time of this general renovation, then for a time it is not difficult to feel confident that the hens are free from lice, mites or other parasites. But even then a good dusting powder should be used frequently and thoroughly, for the parasites that infest poultry and poultry houses are produced by millions, and to keep a pen or house of poultry free from them, constant vigilance and constant labor are necessary.

This is the time to patch up the cracks in the poultry house, look after the windows that need it, and if you have no cloth windows by means of which there is always a constant supply of pure air in winter, without danger of the birds being injured by cold, then by all means put them in. The semi-open front house is best for the Maritime climate, and the worst for any climate is the perfectly tight house without any good means of ventilation, and the heated house. Both these styles of poultry houses were once popular, but they are no longer, the frost and dampness which is bound to collect in houses of this kind being one of the greatest dangers to poultry that ever existed. All the cracks on the north and east sides must be given particular attention, for from these directions the cold winds come.

This is also the time for culling the undesirable birds from the flocks, the time to select next year's breeders, both male and female, and the work of preparing them for this important work should begin soon after the new feathers have grown. They should be good layers, but not hens that never skip a day, for the eggs of such hens are less fertile than those of the hens that lay regularly every other day, and the eggs of these moderately good layers are the ones to select for the breeders. Of course other qualities are to be considered, as color, shape, type and general appearance, first year's egg record, etc. Anyway, the selection should be made in the fall, and may be continued again as the birds develop,even up to the last moment; in fact, continual culling is the only means by which the flocks may be continually and permanently improved, and this can hardly be carried to far.

The cockerels that are going along with the old hens and the cull pullets, to the butcher at Thanksgiving, should be put in a pen by themselves where they will have little chance for exercise, and stuffed on corn and wheat until they are large enough and fat enough to send to market, and then they should be sent without delay, for once they are in condition for sale, they begin to eat their heads off, as the saying goes.

There are many other things that should be done at molting time, but these are the ones I consider most important, and the things that I am doing myself, and that I have done at this season with such satisfactory results that it has been found necessary to vary the routine but little from year to year in order to obtain satisfactory results.—H. L. Goodwin.

Intruding Upon the Hens.

We often hear it said, "The more you are among your fowls the better." While this may apply to the raising of young chicks, I am sure it needs liberal qualifying with respect to the laying hens. The excluding of the egg is a delicate process. It depends largely upon the nervous state of the bird, and birds of the smaller breeds in particular like to feel assured of a period of quiet before they set the machimery in motion to deposit the egg. Any intrusion or racket is certain to retard the operation which is in a degree voluntary. I have known a Leghorn hen that set out to lay in the morning, get so wrought up by continued interruptions of a trivial nature that it was late afternoon before she succeeded. Such delay, of course, means not only loss of valuable time for the hen, but a clogging of the work going on among the undeveloped eggs. Pullets, too, when preparing to lay their first egg, almost invariably vacate the nest at the entrance of a person, and may thus easily be driven to lay in the litter, forming a habit which is not always easy to break. For this reason, therefore, I enter the pens only when necessary, during the forenoon, when the most of the laying is being done.

It is a well-recognized fact that a change of quarters diminishes the egg yield for a period but it is not perhaps so generally known that working in the laying pens, for the purpose of making repairs or alterations, is likely to produce the same result. I once did a job of closing in the roosts of a pen of 25 pullets which had been laying admirably through December. It occupied about two days. I worked carefully so as not to alarm the birds, and they hovered about me almost constantly, apparently too interested or curious with respect to my work to think of producing eggs. At any rate, their yield suddenly fell off at least 50 per cent., and though I did my best the greater part of January passed before I could bring them out of their slump. Through February they again did nicely. I thought it merely a coincidence at first, but after repeated similar experiences, coupled with the testimony of others, I know to the contrary.

A brother breeder, for another instance, had a high-producing pen of Plymouth Rock fowls. He worked a few days finishing off a bantam pen in one corner of their quarters, and though he placed it at an elevation, so as to take nothing out of the floor space, and was careful to interfere in no way with the admission of sun or light, the fowls promptly took a slump and loitered out half the winter. The breeder believes as thoroughly as I do that the less sawing and hammering done around laying hens the better. Nor is it advisable, I am equally sure, to be frequently bustling in among them during the hours of laying.—N. E. H.

Eggs Should be Very Fresh.

An egg is not an egg just because it may have a shell—sometimes the interior of the shell may be little better than the contents of a garbage can that has stood a week in hot weather. The season is at hand when farmers and poultrymen need to be careful with their eggs. It is a season when hens are broody, and it does not take many hours for a broody hen to bring an egg to the point where incubation begins. We will say that the germ of an egg has started to grow, and then it is removed from the nest and suffered to become cold—what takes place? The germ dies, and as soon as it is dead, decomposition sets in and spreads very rapidly. It behooves producers of eggs to be watchful of their hens' nests, especially just at dark, to make sure that no eggs have been left in the nests to be incubated over night. The person who locates a hen's nest in an out of the way place and takes it up with its dozen or more eggs and mingles those eggs with the daily pick-ups, has no business to complain if he losses customers.

The only safe egg is the one that is gathered the day it is laid—to be uncertain about the freshness of an egg is equivalent to having one stand in fear of having his customers quit him in favor of some other producer who is more careful in the way he handles his eggs. The selling price of eggs at the country stores would range considerably higher if there were fewer haymow-gathered eggs pawned off as fresh. We have a good deal of sympathy with the owner of the country store who has to take in eggs and ship them out to a distant market, because when they reach the market the price is set according to the average of the lot, and too often that average is low because of bad eggs received from careless producers.—Conn. Farmer.

Here is a woman who speaks from personal knowledge and long experience, viz., Mrs. P. H. Brogan, of Wilson, Pa., who says, "I know from experience that Chamberlain's Cough Remedy is superior to any other. For croup there is nothing that excels it." For sale by all dealers.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

A GOOD THANKSGIVING.

Said old gentleman Gay on a Thanksgiving Day
If you want a good time, then give something away
So he sent a fat turkey to shoemaker Price,

And the shoe-maker said, "What a big bird! How nice!
And such a good dinner is before me I ought
To give Widow Lee the small chicken I bot"

"This fine chicken, oh, see!" said the pleasant Widow Lee,
And the kindness that sent it how precious to me!
I would like to make someone as happy as I—
I'll give washwoman Biddy my big Pumpkin Pie."

"And, oh sure" Biddy said, Tis the Queen of all pies!
Just to look at its yellow face gladdens my eyes.
Now its my turn I think; and a sweet ginger cake
For the motherless, Finnigan children I'll bake."

Said the Finnigan children—Rose, Denny and Hugh—
"It smells sweet of spice, and we'll carry a slice
To poor little lame Jake, who has nothing that's nice."

"Oh I thank you, and thank you!" said little lame Jake;
"Oh, what a bootiful, bootiful, bootiful cake!
And oh, such a big slice! I will save all the crumbs,
And will give them to each little sparrow that comes."

And the sparrows, they twittered, as if they would say,
Like old gentleman Gay, "On a Thanksgiving Day,
If you want a good time,
Then give something away."

David Copperfield.

By Charles Dickens.

(Continued from last issue)

All this, I saw in the first glance after I crossed the threshold—childlike, according to my theory—and then Peggotty opened a little door and showed me my bedroom. It was the completest and most desirable bedroom ever seen—in the stern of the vessel; with a little window, where the rudder used to go through; a little looking-glass, just the right height for me, nailed against the wall,, and framed with oyster shells; a little bed, which there was just room enough to get into; and a nosegay of seaweed in a blue mug on the table. The walls were whitewashed as white as milk, and the patchwork counterpane made my eyes quite ache with its brightness. One thing I particularly noticed in this delightful house, was the smell of fish; which was so searching, that when I took out my pocket handkerchief to wipe my nose, I found it smelt exactly as if it had wrapt up a lobster. On my imparting this discovery in confidence to Peggotty, she informed me that her brother dealt in lobsters, crabs and crawfish; and I afterwards found that a heap of these creatures, in a state of wonderful conglomeration with one another, and never leaving off pinching whatever they layed hold of, were usually to be found in a little wooden outhouse where the pots and kettles were kept.

We were welcomed by a very civil woman in a white apron, whom I had seen curtseying at the door when I was on Ham's back, about a quarter of a mile off. Likewise by a most beautiful little girl (or I thought her so), with a necklace of blue beads on, who wouldn't let me kiss her when I offered to, but ran away and hid herself. By and By, when we had dined in a sumptuous manner of boiled dabs, melted butter and potatoes, with a chop for me, a hairy man with a very good-natured face came home. As he called Peggotty "Lass," and gave her a good hearty smack on the cheek, I had no doubt, from the general propriety of her conduct, that he was her brother; and so he turned out—being presently introduced to me as Mr. Peggotty the master of the house.

"Glad to see you, sir," said Mr. Peggotty. "You'll find us rough, sir, but you'll find us ready."

I thanked him, and replied that I was sure I should be happy in such a delightful place.

"How's your Ma, sir?" said Mr. Peggotty. "Did you leave her pretty jolly?"

I gave Mr. Peggotty to understand that she was as jolly as I could wish, and that she desired her compliments —which was a polite fiction on my part.

"I'm much obleeged to her, I'm sure," said Mr. Peggotty. "Well, sir, if you can make out here, for a fortnut, 'long wi' her," nodding at his sister, "and Ham, and little Em'ly, we shall be proud of your company."

Having done the honours of his house in this hospitable manner, Mr. Peggotty went out to wash himself in a kettleful of hot water, remarking that cold would never get his muck off." He soon returned, greatly improved in appearance; but so rubicund, that I couldn't help thinking that his face had this in common with the lobsters, crabs, and crawfish—that it went into the hot water very black and came out very red.

After tea, when the door was shut and all was made snug (the nights being cold and misty now), it seemed to me the most delicious retreat that the eye of man could conceive. To hear the wind getting up out at sea, to know that the fog was creeping over the desolate flat outside, and to look at the fire and to think that there was no house near but this one, and this one a boat, was like enchantment. Little Em'ly had overcome her shyness, and was sitting by my side upon the lowest and least of the lockers,, which was just large enough for us two, and just fitted into the chimney corner. Mrs. Peggotty, with the white apron, was knitting on the opposite side of the fire. Peggotty at her needle-work was as much at home with St. Paul's and the bit of wax-candle, as if they had never known any other roof. Ham, who had been giving me my first lesson in all-fours, was trying to recollect a scheme of telling fortunes with the dirty cards, and was printing off fishy impressions of his thumb on all the cards he turned. Mr. Peggotty was smoking his pipe. I felt it was a time for conversation and confidence.

"Mr. Peggotty!" says I.

"Sir," says he.

"Did you give your son the name of Ham, because you live in a sort of ark?"

Mr. Peggotty seemed to think it a deep idea, but answered:

"No, sir. I give him no name."

"Who gave him that name, then?" said I, putting question number two of the techism to Mr. Peggotty.

"Why, sir, his father giv it him," said Mr. Peggotty.

"I thought that you were his father!"

"My brother Joe was his father," said Mr. Peggotty.

"Dead, Mr. Peggotty?" I hinted, after a respectful pause.

"Drowndead," said Mr. Peggotty.

I was very much surprised that Mr. Peggotty was not Ham's father, and began to wonder whether I was mistaken about his relationship to anybody else there. I was so curious to know, that I made up my mind to have it out with Mr. Peggotty.

"Little Em'ly," I said, glancing at her. "She is your daughter, isn't she, Mr. Peggotty?"

"No, sir. My brother in law, Tom, was her father."

I couldn't help it. "—Dead, Mr. Peggotty?" I hinted, after another respectful silence.

"Drowndead," said Mr. Peggotty.

I felt the difficulty of resuming the subject, but had not got to the bottom of it yet, and must get to the bottom somehow. So I said:

"Haven't you any children, Mr. Peggotty?"

"No, master," he answered, with a short laugh. "I'm a bacheldore."

"A bachelor!" I said, astonished. "Why who's that, Mr. Peggotty)" Pointing to the person in the apron who was knitting.

"That's Missis Gummidge-' said Mr. Peggotty.

"Gummidge, Mr. Peggotty?"

But at this point Peggotty—I mean my own peculiar Peggotty—made such impressive motions to me not to ask any more questions, that I could only sit and look at all the silent company, until it was time to go to bed. Then, in the privacy of my own little cabin, she informed me that Ham and Em'ly were an orphan nephew and neice, whom my host had at different times adopted in their childhood, when they were left destitute; and that Mrs. Gummidge was the widow of his partner in a boat, who had died very poor. He was but a poor man himself, said Peggotty, but as good as gold and as true as steel—those were her similies. The only subject she informed me, on which he ever showed a violent temper or swore an oath, was this generosity of his; and if it were ever referred to, by any one of them, he struck the table a heavy blow with his right hand (had split it on one such occasion), and swore a dreadful oath that he would be "Gormed" if he didn't cut and run for good, if it was ever mentioned again. It appeared, in answer to my inquiries, that nobody had the least idea of the etymology of this terrible verb passive to be gormed; but that they all regarded it as constituting a most solemn imprecation.

I was very sensible to my entertainer's goodness and listened to the woman's going to bed in another little crib like mine at the opposite side of the boat, and to him and Ham hanging up two hammocks for themselves on the hooks I had noticed in the roof, in a very luxurious state of mind, enhanced by my being sleepy. As slumber gradually stole upon me, I heard the wind blowing out at sea and coming on across the flat so fiercely, that I had a lazy apprehension of the great deep rising in the night. But I bethought myself that I was in a boat, after all; and that a man like Mr. Peggotty was not a bad person to have on board if anything did happen.

Nothing happened, however, worse than morning. Almost as soon as it shone upon the oyster-shell frame of my mirror I was out of bed, and out with little Em'ly, picking up stones upon the beach.

"You're quite a sailor, I suppose?" I said to Emily. I don't know that I supposed anything of the kind, but I felt it an act of gallantry to say something; and a shining sail close to us made such a pretty little image of itself, at the moment, in her bcight eye, that it came into my head to say this.

"No," replied Em'ly, shaking her head, "I'm afraid of the sea."

"Afraid!" I said, with a becoming air of boldness, and looking very big at the mighty ocean. "I an't!"

"Ah! but it's cruel," said Em'ly. "I have seen it very cruel to some of the men. I have seen it tear a boat as big as our house all to pieces."

"I hope it wasn't the boat that—"

"That father was drowned in?" said Em'ly. "No. Not that one, I never see that boat."

"Nor him?" I asked her.

Little Em'ly shook her head. "Not to remember?"

Here was a coincidence! I immediately went into an explanation how I had never seen my own father; and how my mother and I had always lived by ourselves in the happiest state imaginable, and lived so then, and always meant to live so; and how my father's grave was in the churchyard near our house, and shaded by a tree, beneath the boughs of which I had walked and heard the birds sing many a pleasant morning. But there were some differences between Em'ily's orphanhood and mine, it appeared. She had lost her mother before her father; and where her father's grave was no one knew, except that it was somewhere in the depths of the sea.

"Besides," said Em'ly, as she looked about for shells and pebbles, "your father was a gentleman and your mother is a lady; and my father was a fisherman and my mother was a fisherman's daughter, and my uncle Dan is a fisherman."

"Dan is Mr. Peggotty, is he?" said I.

"Uncle Dan—yonder," answered Em'ly, nodding at the boat-house.

"Yes. I mean him. He must be very good, I should think?"

"Good!" said Em'ly. "If I was ever to be a lady, I'd give him a sky-blue coat with diamond buttons, nankeen trousers, a red velvet waistcoat, a cocked hat, a large gold watch, a silver pipe, and a box of money."

I said that I had no doubt that Mr. Peggotty well deserved these treasures. I must acknowlehge that I felt it difficult to picture him quite at his ease in the rainment proposed for him by his grateful little neice, and that I was particularly doubtful of the policy of the cocked hat; but I

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

Regularity

of the bowels is an absolute necessity for good health. Unless the waste matter from the food which collects there is got rid of at least once a day, it decays and poisons the whole body, causing biliousness, indigestion and sick headaches. Salts and other harsh mineral purgatives irritate the delicate lining of the bowels. Dr. Morse's Indian Root Pills—entirely vegetable—regulate the bowels effectively without weakening, sickening or griping. Use

kept these sentiments to myself.

Little Em'ly had stopped and looked up at the sky in her enumeration of these articles, as if they were a glorious vision. We went on again, picking up shells and pebbles.

"You would like to be a lady?" I said.

Emily looked at me, and laughed and nodded "yes."

"I should like it very much. We would all be gentlefolks together, then. Me, and uncle, and Ham, and Mrs. Gummidge. We wouldn't mind then, when there come stormy weather.—Not for our own sakes, I mean. We would for the poor fishermen's, to be sure, and we'd help'em with money when they come to any hurt."

This seemed to me to be very satisfactory, and therefore not at all improbable, picture. I expressed my pleasure in the contemplation of it, and little Em'ly was emboldened to say, shyly,

"Don't you think you are afraid of the sea, now?"

It was quiet enough to reassure me, but I have no doubt if I had seen a moderately large wave come tumbling in, I should have taken to my heels, with an awful recollection of her drowned relations. However, I said "No," and I added, "You don't seem to be, either, though you say you are;"—for she was walking much too near the brink of a sort of old jetty or wooden causeway we had strolled upon, and I was afraid of her falling over.

"I'm not afraid in this way," said little Em'ly. "But I wake when it blows, and tremble to think of Uncle Dan and Ham, and believe I hear 'em crying out for help. That's why I should like so much to be a lady. But I'm not afraid in this way. Not a bit. Look here!"

She started from my side, and ran along a jagged timber which protruded from the place we stood upon, and overhung the deep water at some height, without the least defense. The incident is so impressed on my remembrance, that if I were a draughtsman I could draw its form here, I dare say, accurately as it was that day, and little Em'ly springing forward to her destruction (as it appeared to me), with a look that I have never forgotten directed far out to sea.

The light, bold, fluttering little figure turned and came back safe to me, and I soon laughed at my fears, and at the cry I had uttered; fruitlessly in any case, for there was no one near. But there have been times since, in my manhood, many times there have been, when I thought, is it possible among the possibilities of hidden things, that in the sudden rashness of the child and her wild look so far off, there was any merciful attraction of her into danger, and tempting her towards him permitted on the part of her dead father, that her life might have a chance of ending that day. There has been a time since when I have wondered whether, if the life before her could have been revealed to me at a glance, and so revealed that a child could fully comprehend it, and if her preservation could have depended on a motion of my hand, I ought to have held it up to save her. There has been a time since—I do not say it lasted long, but it has been—when I have asked myself the question, would it have been better for little Em'ly to have had the waters close above her head that morning in my sight; and when I have answered Yes, it would have been.

This may be premature. I have set it down too soon, perhaps. But let it stand.

We strolled a long way, and loaded ourselves with things that we thought curious, and put some stranded starfish back into the waterMI hardly know enough of the race at this moment to be quite certain

A Bid!

THIS is an earnest, honest bid for your good will. If what we say is *true* we shall learn it. Otherwise it will cost us *heavily*. Besides we shall sacrifice the respect of the housekeepers.

We assert :

Regal Flour bakes the *best quality* and the *utmost quantity* of bread per barrel of any you have ever used. It is economical, little goes far. It makes delightfully light, white loaves. And fine, flaky pastry.

whether they had reason to feel obliged to us for doing so, or the reverse—and then made our way home to Mr. Peggotty's dwelling. We stopped under the lee of the lobster-house to exchange an innocent kiss, and went in to breakfast glowing with health and pleasure.

"Like two young mavishes," Mr. Peggotty said. I knew this meant, in our local dialect, like two young thrushes, and received it as a compliment.

Of course I was in love with little Em'ly. I am sure I loved that baby quite as truly, quite as tenderly, with greater purity and more disinterestedl ness, than can enter into the best love of a later time of life, high and ennoblig as it is. I am sure my fancy raised up something round that blue-eyed mite of a child, which etherealized, and made a very angel of her. If, any sunny afternoon, she had spread a little pair of wings, and flown away before my eyes, I don't think I should have regarded it as much more than I had reason to expect.

We used to walk about that dim old flat at Yarmouth in a loving manner, hours and hours. The days sported by us, as if time had not grown up himself yet, but were a child too, and always at play. I told Em'ly I adored her, and that unless she confessed she adored me I should be reduced to the necessity of killing myself with a sword. She said she did, and I have no doubt she did.

As to my sense of inequality, or youthfulness, or other difficulty in our way, little Em'ly and I had no such trouble, because we had no future. We made no more provision for growing older, than we did for grow, ing younger. We were the admiration of Mrs. Gummidge and Peggotty, who used to whisper of an evening when we sat lovingly, on our little locker side by side, "Lor! wasn't it beaatiful!" Mr. Peggotty smiled at us from behind his pipe, and Ham grinned all the evening and did nothing else. They had something of the sort of pleasure in us, I suppose, that they might have had in a pretty toy, or a pocket model of the Colosseum.

I soon found out that Mrs. Gummidge did not make herself so agreeable as she might have been expected to do, under the circumstances of her residence with Mr. Peggotty. Mrs. Gummidge's was rather a fretful disposition, and she whimpered more sometimes than was comfortable for other parties in so small an establishment. I was very sorry for her; but there were moments when it would have been more agreeable, I thought, if Mrs. Gummidge had had a convenient apartment of her own to retire to, and had stopped there until her spirits revived.

Mr. Peggotty went occasionally to a public house called The Willing Mind. I discovered this by his being out on the second or third evening of our visit, and by Mrs. Gummidge looking up at the Dutch clock, between eight and nine, and saying he was there, what was more, she had known in the morning he would go there.

Mrs. Gummidge had been in a low state all day, and had burst into tears in the forenoon, when the fire smoked. "I am a lone lorn creetur," were Mrs. Gummidge's words, when that unpleasant occurrence took place "and everythink goes contrairy with me."

"Oh, it'll soon leave off," said Peggotty—I again mean our Peggotty—"and besides, you know, it's not more disagreeable to you than to us."

"I feel it more," said Mrs. Gummidge.

It was a very cold dgy, with cutting blasts of wind. Mrs. Gummidge's peculiar corner of the fireside seemed to me to be the warmest and snuggest in the place, as her chair was certainly the easiest, but it didn't suit her that day at all. She was constantly complaining of the cold, and of its occasioning a visitation in her back which she called "the creeps". At last she shed tears on that subject, and said again that she was a lone lorn creetur' and everythink went contrairy with her."

"It is certainly very cold," said Peggotty. "Everybody must feel it so."

"I feel it more than other people," said Mrs. Gummidge.

So at dinner; when Mrs. Gummidge was always helped immediately after me, to whom the preference was given as a visitor of distinction. The fish was small and bony, and the potatoes were a little burnt. We all acknowledged that we felt this something of a disappointment; but Mrs. Gummidge said she felt it more than we did, and shed tears again, and made that former declaration with great bitterness.

Accordingly, when Mr. Peggotty came home about nine o'clock, this unfortunate Mrs. Gummidge was knitting in her corner, in a very wretched and miserable condition. Peggotty had been working cheerfully. Ham had been patching up a great pair of waterboots; and I, with little Em'ly by my side, had been reading to them. Mrs. Gummidge had never made any other remark than a forlorn sigh, and had never raised her eyes since tea.

"Well, Mates," said Mr. Peggotty, taking his seat, and how are you?"

We all said something, or looked something, to welcome him, except Mrs Gummidge, who only shook her head over her knitting.

"What's amiss?" said Mr. Peggotty, with a clap of his hands. "Cheer up, old Mawther!" (Mr. Peggotty meant old girl.)

Mrs. Gummidge did not appear to be able to cheer up. She took out an old black silk handkerchief and wiped her eyes; but instead of putting it in her pocket, kept it out and wiped them again, and still kept it out ready for use.

(Continued in next issue)

Professor H. H. Dean Prepares a Course On "Dairying"

HERE is a Course of Education that will appeal to every progressive farmer. It is the experience and knowledge of the most successful dairymen in various parts of the world put into such a clear and simple form that it may be readily understood and applied with profit by Canadian farmers.

This course is the crowning achievement of Professor Dean's life—the result of twenty-two years' experience as a teacher, scientist, investigator and practical dairyman. Prof. Dean is one of the most eminent dairy professors in the world, being professor of dairying at Ontario Agricultural College, Guelph.

World's Leading Dairy Farms Visited

Much of the material for the course was gathered from visits to the leading dairy farms of the world in England, Scotland, Holland, and the islands of Guernsey and Jersey. There is but one other way to obtain this information. That is, to go abroad yourself and visit these model dairy farms. It would be well worth your while, too, but it would cost you a thousand dollars or more.

Among other things, this course explains the marvelously efficient methods pursued by the "Model Farm" of North Holland where the finest Holsteins are kept.

Two Breeding Systems

This course on "Dairying" also tells about two widely different, yet successful, systems of breeding for milk-producing cows as followed on two Guernsey farms for over forty years. Canadian dairymen should certainly have this information.

But to go into full particulars about this course is impossible in this space. To state the matter briefly, it covers almost everything from the origin and development of dairy cattle and the various breeds to modern dairy stock management. The subjects of "Feeding" and "Breeding" are alone worth many dollars to the man who will apply what he learns.

5-Year Subscriptions Free

The Course aims to meet two classes of readers: *First*—Those who are interested in dairying, but who do not care to answer the examination questions. *Second*—Those who will write on the examination questions at the close of the course. Five year subscriptions to "Canadian Farm" will be given free to the subscriber residing in the Maritime Provinces who makes the highest marks, to the one residing in Ontario and Quebec, and to the one residing in the Western Provinces. You have as good a chance as anyone to win a five years' subscription.

This course is a gift that the Publishers of "Canadian Farm" are making to their subscribers. It cost considerable, more than you imagine, to secure the rights to print this notable series of articles in "Canadian Farm." It is the biggest thing that any agricultural publication has ever pulled off.

Each week for ten weeks, this series of articles will be continued in "Canadian Farm." Each article will be well illustrated and intensely interesting.

Can You Answer These ?

Just as an experiment see if you can answer the following questions. Then you will have some idea as to whether there is anything in the course for you to learn.

1. What is the general outlook for immediate improvement in dairy cattle in Canada?
2. What are the three main theories relating to origin of species?
3. What is the limit of milk production in a dairy cow?
4. What are the strong and weak points of the Ayrshire breed? The Jersey? The Holstein?
5. What is the reason for the high percentage of butter fat in Jerseys' milk?
6. What is the "upward principle" in breeding? (This principle is more important than heredity.)
7. Why is it important to look out for "sports" and "mutants" among cows? How would you discover them, there being no noticeable difference in appearance?
8. What is Nutritive Ratio? Why is it so vastly important for dairying purposes? What are the German, American and O.A.C. Tables of Nutritive Ratio?
9. What is a correct balanced ration for a cow giving 60 lbs. of milk daily?
10. What do the terms "Record of Performance" and "Record of Merit" mean as applied to dairy cattle?
11. What is one satisfactory system of ventilating a dairy?

You will be able to answer these questions and scores of others when you've completed the course—read the series of articles faithfully. Just think how largely you will increase your knowledge. Knowledge is power—power to make larger profits.

Mail the Coupon

Fill in coupon below. Enclose with it 25c. for a three months' subscription, or $1 for a year's subscription. You will receive the entire series of articles in the three months' subscription.

Other notable articles of interest to progressive farmers will also appear in "Canadian Farm" during the next twelve months. After you've read a couple of issues of this bright, newsy, informative publication you'll quickly decide to take it permanently.

But the main thing is to send the coupon in right now, so as to get the "Dairying Course" right from the start. Address the envelope to

"CANADIAN FARM"

To The Public

We beg to announce that we have purchased the good will and interest of the EMPIRE LINIMENT CO. Ltd. and will supply the trade for this excellent Liniment from our factory at Middleton, where all orders should be addressed.

C. GATES SON & CO.

What Says C. H. Purdy, of Bear River, Warden of Digby County, N. S.?

"I was a complete cripple with Rheumatism saw EMPIRE LINIMENT advertised and tried it, after every known Liniment and Rheumatic cure. Here I am to-day, sound and well, after using only a few bottles. I recommend it to all sufferers. Don't be without it.

C. H. PURDY.

Flour and Breadmaking.

(Continued from last issue)

II. SPONGE AND DOUGH METHOD

1 cake compressed yeast.
2 quarts liquid at 90 degrees F.
2 level tablespoons salt.
2 level tablespoons sugar.
2 level tablespoons lard or butter.
Flour.

Mix the yeast and half of the sugar in ½ cup of warm water, and let it stand at a temperature of 80 degrees F. for 15 or 20 minutes to start fermentation.

Measure the shortening, salt, and rest of sugar, into kneading pan, stir in the rest of the liquid, and mix in flour enough to beat without spattering. Then add the well-fermented yeast and beat with a wooden spoon until it looks smooth and elastic.

From this point treat just the same as in the ferment, sponge and dough method.

VARIATIONS.

1. The above calls for strong flour. Soft flour may be used for the dough stage, but must then be kneaded down before it has quite doubled in volume each time.

2. The second rising of the dough may be omitted, but the extra rising makes a loaf of rather finer texture. When a large batch is being made, this may be taken advantage of to delay the baking of part until the first part is out of the oven.

3. The liquid may be all water, part water and part milk, or part potato-water and part milk.

4. Home-made yeast may replace the compressed yeast. Use one cup home-made yeast and only 3½ pints liquid.

5. If the flour is taken from a cold place in the winter, it should be brought to a temperature of 80 degrees F. before mixing it into either sponge or dough. When one has learned by experience what quantity of flour the liquid will take up, it is a good plan to measure the whole quantity into a kneading-pan, mix the sponge into another dish, make a well in the rest of the flour in the kneading-pan, pour in the sponge and stand the whole in a warm place to rise; then when the sponge is risen the rest of the flour can be kneaded in.

III. QUICK METHOD.

¼ cup milk.
¾ cup water.
1 cake compressed yeast.
1 teaspoon salt.
1 teaspoon sugar.
1 teaspoon lard or butter.
Flour.

Put the sugar and yeast into a cup, add ¼ cup of water warmed to 90 degrees F., mix until the whole is smooth and the sugar dissolved, and stand in a temperature of 80 degrees F. for 15 or 20 minutes to begin fermenting. Put the milk on to scald. Measure the salt and shortening into the kneading-pan, pour in the scalded milk, add the rest of the water and bring the temperature to about 90 degrees F. Add strong flour enough at the same temperature to make a batter that will beat without spattering; add the yeast, now fermenting vigorously, and beat with a wooden spoon until it looks smooth and elastic. Mix in at once enough warm flour to make a dough that will not stick to the fingers, turn out on the moulding board and knead as usual. Return to the warm geased kneading-pan, cover closely and stand in a temperature of 70 to 80 degrees F. until risen to rather more than double in volume. This will take 2 to 3 hours.

Knead lightly in the pan for a minute to get rid of the larger bubbles, and stand back in the warm place to rise again until double in volume. This will take 1 to 2 hours.

Shape into loaves that will half fill the bread tins, kneading only to get rid of large bubbles, and smooth the surface. Let rise until doubled in volume, then bake and cool as usual.

VARIATIONS.

1. Soft flours may be used for the whole process in this method, but care must be taken to knead it down at the proper time. It should be allowed to rise the first time to a little less than double in volume, and succeeding times still a little less. Once over-risen, soft flour dough is very hard to make into a good bread.

2. This process may be used for setting over night, using one cake of yeast to six times the quantity of all the other ingredients, and allowing it to rise 9 to 10 hours the first time. The longer time will develop a delicious flavour which can never be attained by the short process.

3. Home-made yeast may be used omitting the water. Bring the yeast to 80 degrees F., add the sugar, and allow it to stand 10 to 20 minutes to begin working before adding it to the sponge.

HOME-MADE YEAST.

4 medium sized potatoes.
½ cup hops.
1 quart boiling water.
½ cup sugar.
1 cup flour.
2 level tablespoons salt.
1 compressed yeast cake.

Boil the potatoes, drain away the water, and mash the potatoes until free rfom lumps. Pour the boiling water, which may contain the water drained from the potatoes, over the hops and simmer 15 minutes. Measure into a three-quart bowl, or crock, the flour, sugar and salt, and mix them thoroughly. Strain the hop water, and add at once to the crock, stirring rapidly all the time. Add the mashed potatoes and give the whole a thorough beating. Cool to 70 or 80 degrees F., and add one compressed yeast cake soaked in ¼ cup of warm water for half an hour. Keep at a temperature of 70 degrees F. for 3 or 4 hours, stirring down as often as it comes to the top. Bottle and keep in a cool place. Do not cork it tightly at first.

One cup of yeast is equal to one compressed or one dry yeast cake.

ROLLS.

1½ cup milk.
½ cup water.
1 cake compressed yeast.
2 level teaspoons salt.
2 lever teaspoons sugar.
2 level teaspoons butter.
1 level tablespoon lard.
Flour.

Put the yeast cake and one tablespoonful of the sugar in a cup, add

Did You——Yet?

KING COLE TEA

OCTOBER and NOVEMBER BRIDES

When selecting the outfit for your new home, remember that the Kitchen Range is the keystone of domestic happiness. The best of cooks can't get results with a poor stove. If you select an

ENTERPRISE MONARCH STEEL RANGE

it will be an ornament to your kitchen, will be easily regulated and economical in fuel, and best of all, with its accurate thermometer, cooking chart, and other up-to-date features, you will have no trouble in preparing the meals for the new home.

The MONARCH will give you satisfaction in every way—this we are prepared to guarantee.

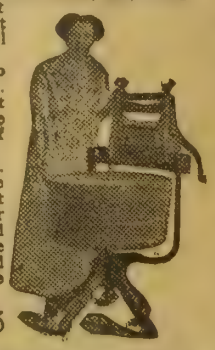
Sold by all the leading stove dealers, used by hundreds of housekeepers in Canada; and made only by

THE ENTERPRISE FOUNDRY CO.,

SACKVILLE, - New Brunswick

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.



So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

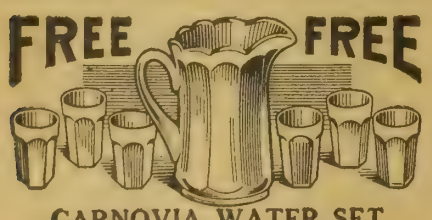
Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;

G. W. MORRIS, Manager 1900 Washer Co'p'y.

357 Yonge Street, Toronto, Can.

FREE FREE



CARNOVIA WATER SET

A wonderful offer to further introduce DR. BURDICK'S MULSTER TABLETS. An honest proposition to ladies who want a handsome seven piece water set free, and easy to get.

These elegant Carnovia Water Sets are made of the finest fire-finished crystal glass, and prescut into a beautiful octangular design. They are rich and massive looking, with the brilliant lustre that distinguishes the finest cut glass.

In order to further introduce DR. BURDICK'S MULSTER TABLETS — the great new discovery for the cure of impoverished blood, nervousness, indigestion, constipation, and a grand tonic that braces and invigorates the entire system

WE WILL GIVE YOU ONE OF THE ELEGANT CARNOVIA WATER SETS, IF YOU WILL AGREE TO SELL ONLY FOUR BOXES OF MULSTER TABLETS.

We will send you four boxes and trust you with them until sold, if you will send us your name and address to-day. Not one other condition to this offer. As soon as you have sold the four boxes, your elegant water set will be shipped to you, as we have them already packed for delivery

A SET OF SIX DE LUXE TEA SPOONS FOR EACH ONE OF YOUR CUSTOMERS.

We will send you four certificates to give to each purchaser valued at $3.00, which entitles your customers to a set of six elegant De Luxe Tea Spoons free. No one will refuse to buy a box of MULSTER TABLETS when shown the grand opportunity on the certificate

Don't hesitate! Send us your name and address to-day.

Advertise in the Maritime Farmer

¼ cup of the water warmed to 90 degrees F., mix until smooth and the sugar is dissolved, and stand in a temperature of 80 degrees F. for 20 minutes. Put the milk on to scald. Measure the butter, lard, salt, and the rest of the sugar into a kneading-pan, pour in the scalding milk, add the remaining ¼ cup of cold water, and allow it to come to 90 degrees F.

Add enough flour to make a batter that will not spatter when beaten, stir in the fermenting yeast, and beat until it looks smooth and elastic.

Mix in enough more flour to make a dough that will not stick to the hands. Turn out on the board and knead until smooth, velvety and even textured. Return to the warm, greased bread-tin, cover closely, and keep at 80 degrees F. until nearly tripled in volume.

Knead down in the pan, and let rise again at 80 degrees F. until double in volume.

Shape into small rolls, remembering that they will increase greatly in size, put them into greased pans, and stand in a temperature of 80 degrees F. until doubled in volume. Take care that the surface does not dry. If it is not possible to keep them covered closely, it will be necessary to moisten the top occasionally with warm milk or water.

Bake in a little hotter oven than used for bread for from 20 to 35 minutes, depending on the size of the rolls and the heat of the oven. The oven must not be too hot at first or it will prevent the expansion of the rools, and may result in doughy centres.

Cool quickly by exposing as much surface as possible to the air.

SUMMARY.

The essentials of sucressful home breadmaking are:

1. Good bread flour.
2. Good yeast.
3. Dough of the right consistency.
4. Control of the temperature at all stages.
5. To remember that soft flour has not the expansive power of strong flour, and that soft flour doughs must never be allowed to rise longer than necessary. If it rises to the point of falling back, results will not be good.
6. To avoid drying out of the surface at all stages, as this makes a dark streak through the baked loaf.

MACDONALD INSTITUTE RECIPE FOR BAKING POWDER BISCUITS.

4 level cups flour.
1 level teaspoon salt.
2 level tablespoons shortening.
2½ level tablespoons baking powder.
About 1½ cups milk.

The shortening may be sweet lard, or dripping, or butter, or a mixture.

See that the shortening is soft enough to run easily. Place the board, mixing knife, rolling pin, cutter, and pan ready and see that the oven is hot.

Sift the salt and flour into a bowl; rub the shortening into it with the fingers; sift in the baking powder, and mix well. Mix into a soft dough with the milk, using a broad-bladed, flexible knife, in order to cut and mix it quickly. Flour the board lightly, turn the dough out, and roll it round to coat it with flour. Knead just enough to make the dough smooth, roll out about an inch thick, and cut into small biscuits.

Place them in a pan, wet the tops only with hot milk or water, and bake in a hot oven about 20 minutes.

The secret of success is a slack dough, quick mixing, and little handling.

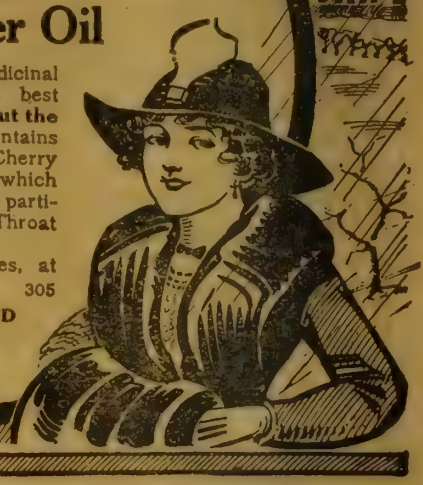
NATIONAL DRUG AND CHEMICAL CO. OF CANADA, LIMITED.



Simple Treatment for Childish Ailments.

VOMITING.

Withhold food until the stomach becomes quiet—from twelve to twenty-four hours in severe cases. Nature is trying her best to effect a cure by emptying the stomach. Give water that has been boiled and cooled If the stomach is sour, lime water is efficacious. The white of an egg stirred—not beaten—in a glass of water may be given in teaspoonful doses; the stomach seldom rejects it. One-tenth grain of calomel should be given every hour until ten doses are administered, followed by a dose of castor oil.

Nothing allays nausea and vomiting so quickly as mustard applied to the stomach. A poultice for an infant is made by moistening two parts of flour wth one of ground mustard; egg albumen incorporated with it lessens the tendency to blister. It is also well to anoint the site of application with vaseline.

Caution.—Do not moisten the mustard with boiling water. It destroys the essential oil upon which the mustard depends. Neither should the poultice be heated after it is prepared.

COLIC.

Search for the cause; if found, remove it. Abdominal bands should not be tight; an infant breaths with its abdomen. Avoid remedies containing habit-forming drugs; baqies need little medicine. Peppermint water, asafetida and ipecac are uaually harmless and may do good; they expel gas from the stomach or cause slight nausea with resulting relaxation. A little weak camphor water is also a good remedy. Teas create gas on the stomach and derange digestion; the same is true of syrup of pepsin and other syrupy agencies.

Whisky relieves colic by lulling the little one into a stupor, but its use can seldom be sanctioned. The writer observed one case in which a babe was given whisky nightly for some time, the result being a diminutive tippling habit which was in itself about as alarming as the original ailment. The moral side of this matter is obvious.

DIARRHOEA.

This often depends upon retained fecal matter in the bowels. If the diarrhoea is persistent, clear out the bowels with an enema of warm water and follow this by one of cool water to which starch has been added. Regulate the secretions with small doses of calomel, followed by castor oil or syrup of rhubarb. Cool barley water helps to control diarrhoea. If the babe is bottle-fed the milk should for a while be pasteurized—which is heating to 167 degrees. A homely substitute for this consists in dipping the bottles of milk in boiling water for a few minutes, then cooling. Give no starchy or indigestible food. A young child has feeble capacity for digesting gruels of oatmeal, barley, arrowroot and other farinaceous articles. These are for the child of eight or ten months.

FAULTY DIGESTION.

Indigestion and poor assimilation cause most of the ills mentioned. They all have their origin either in improper feeding or inherent weakness in the child. Mothers are prone to

Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

err in feeding too often; the stomach must have intervals of rest. A babe three months old should not be fed oftener than every three hours. If cow's milk is used, see that it is fresh and pure in quality; a certified milk is to be preferred. Dilute the milk to a point where it is retained and assimilated. When a babe throws up, the milk is too strong for its digestion or it is getting too much of it.

Tablets for making lime water of official strength may be purchased at the drug store. Use freely in the milk, but not enough to give it an ill taste or flavor. For sweetening the milk cane sugar is not so good as milk sugar. The latter is a fine white powder which can be purchased in pound cartons.

Note.—Milk sugar being only one-half as strong as common sugar, it must be used in double quantity. It makes the milk more easily digested.

Give the baby plenty of cool water. It requires a drink almost as often as an adult. It is often well to give water just before feeding, and it will not overfeed for the purpose of satisfying thirst. Begin early and teach the babe to drink water from a nursing bottle, and from a cup as he grows older. Give him all the pure air and sunshine possible and avoid jolting and rocking.—W. T. Marrs, M. D.

Is This True ?

Ell Wheeler Wilcox says:

The successful home maker must possess certain old-fashioned virtues and put them into daily practice.

She must be orderly in her mind and her habits first of all, and she must have high ideals of womanhood, of motherhood, of wifehood, and of the importance of the home as an institution on which the security of the nation rests.

She must realize the necessity to make and keep her home and herself attractive and to live a life that is above reproach, while she shines as a centre for bright, intelligent, clean social life. It is astonishing and disappointing to see how few American women live up to these requirements.

It is indeed to be hoped that with woman's larger outlook and by her business education she will develop into the real homemaker—the real home keeper. And that the home—the absolutely successful home, the home which is an inspiration to all who enter it, a haven of peace and beauty and comfort to all its inmates, the home where wholesome and sane pleasures abound, the home with no skeletons in the closet, and no discords within its walls will be the rule, not the exception as it is today.—Exchange.

Care of Lamps.

A manufacturer of lamps has the following to say in regard to their care:

"The reason lamps smell and give poor light is because they are not kept clean, or because the wick is poor or clogged by having been used too long or else the chimney is wrong

" A lamp should be cleaned, trimmed and filled daily. Trim by rubbing the char off the wick. This leaves it even. Wick should never be cut, because it is impossible to do it evenly. Keep the tiny holes in the floor of the burner clear for draft.

Lamps should never be quite full, because the oil expands with heat, and if there is no escape then an explosionis liable to take place.

"Boil the burner in strong soda water once a month and empty the fount whenever any sediment appears.

Never open a lamp while hot. Some persons even need to be told never to fill a lighted lamp. There is explosive vapor in a hot lamp.

"Light a lamp with the wick turned low and raise gradually. Some gas is very quickly generated if the wick is turned high at once, and there is, too, more danger of the chimney breaking.

"When a lamp has stood long enough to get hot it should be moved with very great care."

BABY'S OWN SOAP

Best for Baby *Best for You*

THE particles of pure vegetable oil which are rubbed into the open pores of the skin with the creamy fragrant lather of Baby's Own Soap renew the life of the skin—help nature along. It assures a soft, white, healthy skin and its use delights both young and old. Baby's Own is for sale almost everywhere.

1-12

ALBERT SOAPS LIMITED, MFRS., MONTREAL.

Cleaning Bottles and Decanters.

Bottles, decanters, etc., may be cleaned by dropping crushed egg shells into them with soapy water. This is a safe method. Potato peel, also bits of paper, may be used in the same way. For coarse glassware or for very bad stains a handful of tacks or shot will be effective. If the stains refuse to budge, then a weak solution of commercial muriatic acid will remove them. The vessel should be thoroughly rinsed after cleaning with the acid.

When decanters or glass bottles have a musty odor they might be sweetened by mixing a little powered charcoal with warm water, using it for thoroughly rinsing.

HAD DYSPEPSIA FOR TEN YEARS

COULD NOT KEEP ANYTHING ON HER STOMACH

Dyspepsia is caused by poor digestion, and to get rid of this terrible affliction, it is necessary to place the stomach in a good condition. For this purpose Burdock Blood Bitters has no equal.

Mrs. Norman A. MacLeod, Port Bevis, N.S., writes:—"For the last ten years I suffered dreadfully with dyspepsia, and I could not keep anything on my stomach. I tried several kinds of medicines, but none of them seemed to do me any good. At last a friend advised me to try Burdock Blood Bitters, which I did, and after using five bottles I was completely cured. I would advise any one troubled with stomach trouble to use B.B.B. I cannot recommend it too highly."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

The Relation of Footpounds to Brake Horse Power.

Brake Horse Power is the term usually applied to the power an engine or motor has lift to deliver to the purpose of driving other machinery, after driving itself. Therefore an engine must first produce sufficient energy to drive itself, before it can be relied upon to supply energy for the purpose of driving other machinery.

Whatever energy a motor is capable of developing over and above that which is required to hrive itself represents the brake horse power. But how is brake horse power measured? Nearly every gas engine reader is familiar with the devices or contrivances necessary to make a brake test, and that by means of friction applied to the fly-wheel or belt pulley the engine is held down to a full load.

The means of measuring this friction necessary to absorb all the surplus energy of the motor is based upon foot pounds, the established unit of measuring applied energy. Now what is a foot pound? It requires a certain standard of force to lift a pound weight a foot high in one minute, then to lift ten feet high would require ten times the standard unit. This force or energy necessary to raise the one pound weight one foot high in one minute is called a foot pound. And the force of energy necessary to raise the weight ten feet high is designated ten foot pounds, or a weight of ten pounds one foot high in one minute would constitute ten foot pounds.

Hence in establishing the unit foot pound, three factors, energy, time and distance are considered. And to establish mechanical horse power it was estimated and established that the avreage horse strength is equal to 33,000 foot pounds. Consequently 33,000 foot pounds is accepted as representing one mechanical horse power.

An explosive impulse of gas in the cylinder behind the piston imparts to it a certain amount of energy, which is converted through the connecting rod and crank shaft into a rotary motion of the fly wheel. It is in this form of rotary force that we are called upon to measure its power for work. And the simplest form of brake or friction device that we can contrive is to fasten one end of a rope to a spring weighing scale fastened to the floor and then make one full turn of the rope in the direction the fly wheel turns around the face of the fly wheel and enough more to let the other end of the rope hang near the floor on the opposite side of the wheel from the spring scales.

If the motor is now started and after running up to its normal speed a sufficient pull is made on the loose end of the rope to tighten it onto the face of the flywheel until there is sufficient friction to put the engine under full load, the scale will register the rotary frictional effort in pounds, as well as the pull on the other end of the rope. The torque registered on the scales less the pull on the end of the rope represents the force absorbed by the friction of the rope on the fly wheel force and is energy that moves; the distance of the circumference of the wheel at each revolution. Consequently if the friction torque on the scale registers 30 pounds, and the cirrumference of the fly wheel is 9 feet, then the engine is doing the work of lifting 30 pounds 9 feet high at every revolution of its wheel, and if it turns 300 times in a minute it will do the work of lifting 30 pounds 2,700 feet high in a minute. or it will be doing 2,700 times 30, which equals 81,000 foot pounds. And since 33,000 foot pounds equals 1 horse power, 81,000 foot pounds equals 2 5-11 horse power. The reader will notice all the way through this calculation that energy, distance and time are considered.

Energy is represented by the 30 pounds registered by the scales.

Distance by the 2,700 feet travelled by the rim of the fly wheel in its 300 revolutions.

Time, one minute.

We find that many persons, who are fairly well posted as to the means employed for brake test do not understand the principles they are instructed to follow in order to arrive at the power results.

In the above example the engine is not only driving itself, but it is constantly lifting, in addition, 30 pounds of the rim of its fly wheel at the rate of 2,700 feet a minute.

YOUR VITALITY CAN BE RESTORED

Strong, vital, healthy manhood fascinates all who come within its influence. As true as you are a living, breathing human being, I can restore your VITAL strength; there is not a shadow of a doubt as to what I can thus do. BUT there is a single condition, one restriction I put, a certain solemn promise I exact from you before you can exact a promise from me; namely: you must unconditionally agree now at once and forever to discontinue all dissipation; with this out of the way I will do the rest. Remember what I say; no matter what your present condition; no matter what has happened in the past, just forget it and put yourself in my hands; everything will come out as you wish it. I use no drugs, no lotions, no medicines; I place no foolish restrictions upon you; just lead a natural life, get all the enjoyment you possibly can, but cease dissipation; always remember that. I can then restore your vital energy: I can take you out of the half-man class and put you in the spotlight of full, healthy, contented vigor; I can make you feel young again and keep you feeling young to a ripe old age, because I drive into your system the one thing which keeps the whole organism in balance, namely, VITALITY. My HEALTH BELT with suspensory attachment is the greatest single self-treatment remedy or VITALITY RESTORATIVE that the world has ever known, or probably ever will know. It is worn comfortably about the waist all night and every night for two or three months. Thus while you are sleeping it sends a great, soft, potent, life-giving current of VITAL FORCE into your blood, your nerves and your organs. There is not a moment's wait. It helps you immediately; it commences from the first time worn, to show you the sunshine of new energy; it takes the kink out of your back in one night; it makes a man of you after you have given up in despair, simply because it supplies you with VITAL POWER—which means health. Just stop to think. You have the same organs, nerves and fibre, the same make-up exactly that healthy, vigorous men possess, the only difference being you are under tone; you need a foundation of NEW VITAL RESERVE, and it is this I give you. There is no reason why you should not be as strong, healthy and vigorous as the best fullest-blooded man of your acquaintance. The matter is easy if you do your part. Never mind about buying a HEALTH BELT as yet; first get in communication with me; read over my booklet, and if you want to do so tell me your physical ailments that I may advise you; then a little later we can arrange in some way for you to try my HEALTH BELT. But first fill in the coupon and get the book free, or call at my office. My HEALTH BELT also cures Rheumatism, Kidney, Liver and Stomach disorders.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing oa strong. Write or call to-day. Hours, 9 to 6.

DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.

J. W. Copeland, of Dayton, Ohio, purchased a bottle of Chamberlain's Cough Remedy for his boy who had a cold, and before the bottle was all used the boy's cold was gone. Is it not better than to pay a five dollar doctor's bill? For sale by all dealers.

Actinomycesis or Hard Tongue in Cattle.

This disease is met with in most parts of Great Britain under such popular names as Hard Tongue, Wooden Tongue, Wens, Lumpy Jaw, Big Head, &c. In this country cattle are principally attacked, but the disease may also occur in pigs, sheep, horses or man. According to a leaflet issued by the Board of Agriculture and Fisheries Actinomycosis runs a chronic course and is characterized by the formation of tumors in various parts of the animal body. These tumors interfere with the functions of the organs in which they are situated and usually burst or ulcerate. If untreated the animal steadily wastes away, especially if the tongue be affected, and it eventually dies.

The disease is caused by the entrance into the animal, and the propagation in its tissues, of the parasitic fungus Actinomyces. This fungus grows on grasses and most cereals, particularly on barley, flourishing luxuriantly on damp rich soils. Injuries to the skin and to the mucous membranes of the mouth and tongue, caused by hard straws or barley awns as well as the teething troubles of young animals, predispose cattle to this disease by favoring the entrance of the Actinomyces to the tissues.

The disease is usually local or confined to one organ of the body, and the symptoms are largely determined by the part attacked. Nodules of varying sizes often form on the skin of the head and neck, at times being firm to the touch, while sometimes the skin is broken and the nodules are granular, soft, yellowish in colour, and covered by a crust. The skin covering the lips, being very liable to injury, is frequently attacked, the lips then becoming hard and enlarged to such an extent that food is gathered with difficulty. The tongue, however, is the most common seat of the disease. The presence of the Actinomyces in this organ excites a growth of fibrous tissues, causing the tongue to become hard and immobile, hence the name "wooden tongue." This gives rise to a constant dribbling of saliva and quidding of the food, which causes the mouth to be examined, The hardness and painfulness of the tongue and the presence of ulcers at its base, render this form of the disease easy of diagnosis. Tumours can sometimes be felt under the skin in the muscels of the cheeks. The jaw bones, usually the lower, may be invaded by the Actinomyces from the soft tissues of the mouth and possibly through the sackets of the teeth. Great swelling of the attacked bone is noticed, and the head sometimes swells to a great size. Pus collects in cavities in the bone, eventually breaking through the skin, and forming wounds which constantly discharge. In this condition the jaw is easily fractured and the teeth drop out. A very common form is met with when the glands of the neck are affected—a swelling or "wen" appears between the angles of the jaw, which steadily increases in size until breathing and swallowing are interfered with. These tumours often burst and discharge a characteristic, granular yellow pus. The presence of tumours (polypi) attached to the musous membrane of the mouth and the back of the throat can often be recognized by the snoring grunt which accompanies breathing, and by the difficulty in swallowing. Actinomyces also occurs in the udder, and in the spermatic cord of castrated animals, giving rise in each case to fibrous enlargement of the organs.

TREATMENT.

In districts where the Actinomyces flourishes it is almost impossible to prevent animals being attacked. 1. Drainage of land is said to have diminished the number of cases by checking the growth of the fungus. 2 If barley straw must be fed to stock, it should not be given to young animals when changing their teeth, as the fungus then has an excellent opportunity of then entering the tissues through the gums. 3. Although prevention is difficult, the disease responds to treatment. Whenever possible, the tumours caused by the disease should be removed by a veterinary surgeon. When their position renders an operation impossible, medicinal treatment will generally check or cure the disease. Treatment should only be attempted by a skilled surgeon, as the tumours have usually to be removed from the region of the head and throat, while the success of the medicinal treatment depends on giving iodide of potassium under expert supervision until symptoms of poisoning by this drug appear, when its administration must immediately be stopped. Affected animals should be isolated during treatment. 4. No evidence is forthcoming that the disease has ever been established on a hitherto clean farm by the importation of infected animals; nevertheless, it is not advisable to introduce a diseased animal among a clean herd. 5. Farmers who have cattle suffering from this disease should consult a veterinary surgeon.

This Stylish Ulster

Best English Tweeds $8.75
Lined with Fleece or Italian Linings

Here's a remarkable overcoat at a remarkable price. The price is English—all clothing is cheaper in the "old country" than here—and you get the benefit of our colossal output.

England is the home of "Tweeds"—and is, too, the home of good tailoring, both in style and workmanship.

This winter overcoat will excite the envy of your friends who have paid three times as much.

The fleece lining is a new feature—will keep you warm in the coldest weather. The coat is double-breasted style, with belt behind. In fact, this garment is a chance to Canadians to get a coat to their own requirements at the English price, from a leading London firm of tailors—and London style leads the world.

(Cut in either American or English styles.)

Also an English "Fall" Raincoat
The "REGOETTE" $8.75

Made to Your Measure. Two Styles.

The "Regoette" Raincoat is right up to date in cut, style and finish. Light in weight, it may be carried over the arm without inconvenience, whilst as a walking coat in cool weather it is just right. Easy fitting and good looking. The excellence of both material and tailoring is apparent at once to discriminating men. It carries an absolute guarantee to keep out the water or money refunded.

This is a smart, dressy raincoat, of which thousands are being worn by well-dressed men in England—men who are notoriously hard to please in the matter of clothes.

(American or English cut.)

Get the Two Coats for $16.25
Carriage and Duty Paid.

Such a price is only possible by reason of our huge business—one of the largest in London—enabling us to purchase largely, and therefore cheaply.

Have your garments made to your measure. Maintain individuality in your dress.

THE REGO CLOTHIERS, LIMITED,
122 Cheapside, London, E.C.

P. E. I. October Circular.

The weather continues rainy and cold. The longest period of fine weather during the month was from Sept. 24th, to 27th, inclusive.

Harvest is not yet complete. In the lower lying sections there is still a lot to cut and only about half is harvested. Of the total grain crop about 10 per cent. is yet to save, 10 per cent. has been, or will be cut green and will be used for cattle feed. The wheat that is being threshed is turning out poorly; the oats splendidly, frequently yielding over a bushel to the stock. Where properly saved the quality is excellent.

Potato digging has been begun, but it is not yet general. The crop will probably be about 70 per cent. average. They are generally reported as being small and numerous. Some correspondents report dry rot.

The turnip crop will be much below average.

Apples are a fair crop and the quality is good. Plums have been very abundant and are now bringing 5 cts. a quart.

The milk supply at the present time is much better than for this month last year. Eggs are plentiful.

The following are the market prices for Oct. 10 th 1912.

Oats, Black	44 cts. per bus.
Oats, White	42 cts. per bus.
Straw	$7.00 per ton.
Eggs	25 cts. per doz.
Chickens	90 cts per pr.
Lambs	5 cts. per lb.
Potatoes	25 cts. per bus.
Butter	22 cts per lb.
Hay	$13.50 per ton.

The cheapest, because the most easily prepared, moist food for poultry is sprouted grain. Wheat, barley or oats may be sprouted to furnish green food for fowls. Select a sheltered place, pour out the grain, dampen with water, then cover lightly with sand or good soil. In a few days it will be sprouted, when it should be fed to the fowls. Where one has no time to plant a green crop this is a good method of supplanting the fowls with green food occasionally.—W. M. Phillips.

Had Indigestion, Sour Stomach and Severe Headaches

FOR OVER A YEAR

Mr. W. Moore, 132 Lisgar St., Toronto, Ont., writes:—"After having been troubled with indigestion, sour stomach, and severe headaches for over a year, I was induced to try Milburn's Laxa-Liver Pills. One vial greatly benefitted my case, and three vials completely cured me. I can heartily recommend them to any one suffering from stomach or liver trouble."

Milburn's Laxa-Liver Pills stimulate the sluggish liver, clean the coated tongue, and remove all waste and poisonous matter from the system.

Price, 25 cents per vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

MAXWELL'S
HIGH SPEED CHAMPION

is in a class by itself—the easiest running, the most substantially built, the most satisfactory washer, ever invented.

Only washer worked with crank handle at side as well as top lever—and the only one where the whole top opens up.

Ask your dealer to show you the "Champion" Washer.

"Favorite" Churn is the world's best churn. Write for catalogue.

Facts About Tubercolosis.

It is an extraordinary fact that a cow may present a perfectly healthy appearance, thrive well upon her feed and give a good flow of milk, and yet be in a badly diseased state with tuberculosis. This is very clearly brought out in a pamphlet prepared by the International Commission on the Control of Bovine Tuberculosis. Photographs are shown af fine looking animals that are known to have been diseased for years without cough and otherwise apparently healthy, and yet constantly passing tuberculosis germs that when consumed by hogs produced the disease. Such animals are a constant menace not only to the health of the herds to which they belong, but also to the people who use their milk, or are otherwise associated with them. Apart from the health standpoint, the disease causes the loss of millions of dollars annually in cattle and hogs besides materially decreasing the food supply of the country. The disease is commoner in some regions than in others, in some districts it being no uncommon thing to find as many as 70 to 80 per cent. of the cows in a herd diseased. In order to lay these and many other important facts regarding the disease before cattle raisers and others interested in live stock, a large issue of the pamphlet known as the Tuberculosis Primer was printed by direction of the Honourable, the Minister of Agriculture. Those who have not already received a copy may do so by applying to the Publications Branch of the Department of Agriculture at Ottawa.

New Professor for Acadia University.

The following new Professors have been appointed at Acadia University:

Mr. Ralph P. Clarkson has been appointed to the Ivan Curry Professorship of Engineering. Mr. Clarkson is a graduate of Worcester Polytechnic Institute having taken his work in Electrical Engineering; he also included most of the Mechanical subjects. Besides practical work he has taught one year in the University of Vermont and left there to accept an important position in the Patent Office in Washington. There Mr. Clarkson has been employed as a government expert in the examination of applications for United States patents in Engineering subjects passing judgment on the operativeness, usefulness and novelty of machines submitted. Mr. Clarkson will take up the work in Engineering formerly done by Professor Durkee.

Harold Garnet Black has been appointed Professor of English. Mr. Black was a native of Pugwash, Cumberland County; prepared for college in Sackville Academy anh graduated from Mt. Allison in 1907 when he was valedictorian of his class. The following year he taught in the Mt. Allison Ladies' College and since then has been doing graduate work in English at Harvard. He has received his M. A. from the latter Institution and has almost completed his residence for his Doctor of Philosophy requirements. Mr. Black comes to Acadia with the highest recommendations and the authorities feel assured of his success.

Slaughtering Hogs.

A pen of hogs ready for killing should not be fed within twelve to twenty-four hours previous to slaughtering, but should have a chance to clean and cool out. On many large farms where from thirty to fifty hogs are to be killed, the work begins about 2 o'clock in the morning. The first preparations are made the day before. A sufficient amount of wood is on hand to keep the great pot boiling and all other needed paraphernalia is got ready. A whiskey or

Big Ben

Big Ben ends the over-sleeping of Farm Hands

Will you spend Two-Fifty to insure yourself *for years* against that everlasting bother—*getting the farm hands in the fields on time?* Will you spend it to insure *a full days work* from each man six days out of every seven.

Then, spend it for Big Ben. He's doing it on thousands of farms every day right now. More than a million people have spent it for Big Ben to help them get to work on time. Don't you want to join the Big Ben Army. Don't you want your farm hands to be members?

Alarms are sold at $1.00 and $1.50 less than Big Ben costs but such alarms are merely things to *wake up* by, not to wake *on time* with. They enable you to make a *guess* at the right time, that's all.

Big Ben enables you to *know* the right time. *When he* wakes you he does it at the time you *want*, the *right time.*

Then, cheap alarms *may* last a year but Big Ben *actually* lasts for years *and* years. He's built of *steel.* He's a handsome *clock* plus a punctual alarm. You can use him all day long in any room for he fits bed room, parlor, dining room or hall.

The city man can get the right time of his neighbor or by picking up a telephone but that's not so convenient for *you.* You need a reliable timekeeper always in the house. That's why you need Big Ben more than you need a plain "alarm."

Big Ben rings just when you want and either way you want *five straight minutes* or *every half minute during ten minutes unless* you flag him off. His big keys make winding easy and his great open face and large hands tell the time plainly across the largest rooms.

Big Ben is sold by 5,000 Canadain dealers. His price is $3.00 anywhere.—If you cannot find him at your dealer's, a money order sent to his designers, *Westclox, La Salle, Illinois,* will bring him to you duty charges paid. Put him right now on your Xmas list.

AN HOUR'S WORK ONE CENT

SUSSEX MOTOR CO., Ltd., - Sussex, N. B.

vinegar barrel is the best to scald the hogs in. Care should be taken to ascertain that the temperature of the water is exactly right before the hog is dipped; otherwise the hair will be set, and it will be a hard matter to have the carcass well cleaned.

The hair from feet and ears and head should be got off as clean as possible as soon as the hog is dipped, in order to avoid so much scraping with a knife afterward. After the hog has been scraped clean, hang him up to cool and insert a corncob or chip in his mouth.

If the hog pen is far from the house haul the carcasses up in wagons or carts, putting clean, fresh straw in the bottom. It is best not to pile the hogs in indiscriminately on top of each other, as the carcasses will get soiled from the blood that drips from their mouths or from the gashes in their throats where they were stuck. Each carcass should be thoroughly rinsed off with cold water after being scraped and then hung up.

Be most careful in opening the carcasses not to cut into the entrails. Whoever has charge of the work should be familiar with it and have a steady hand. Let the entrails drop into a clean tub and remove the liver and heart. Drench the abdominal cavity, now emptied, with one or more buckets of cold water; then leave out of doors to cool out well.

Take down the carcass at night and place on the floor of the smoke-house, seeing that the floor has been properly cleaned. When all the animal heat has left it, which will be by the following morning if weather conditions are right, begin the work of cutting up and salting down.—Sylvanus Van Aken.

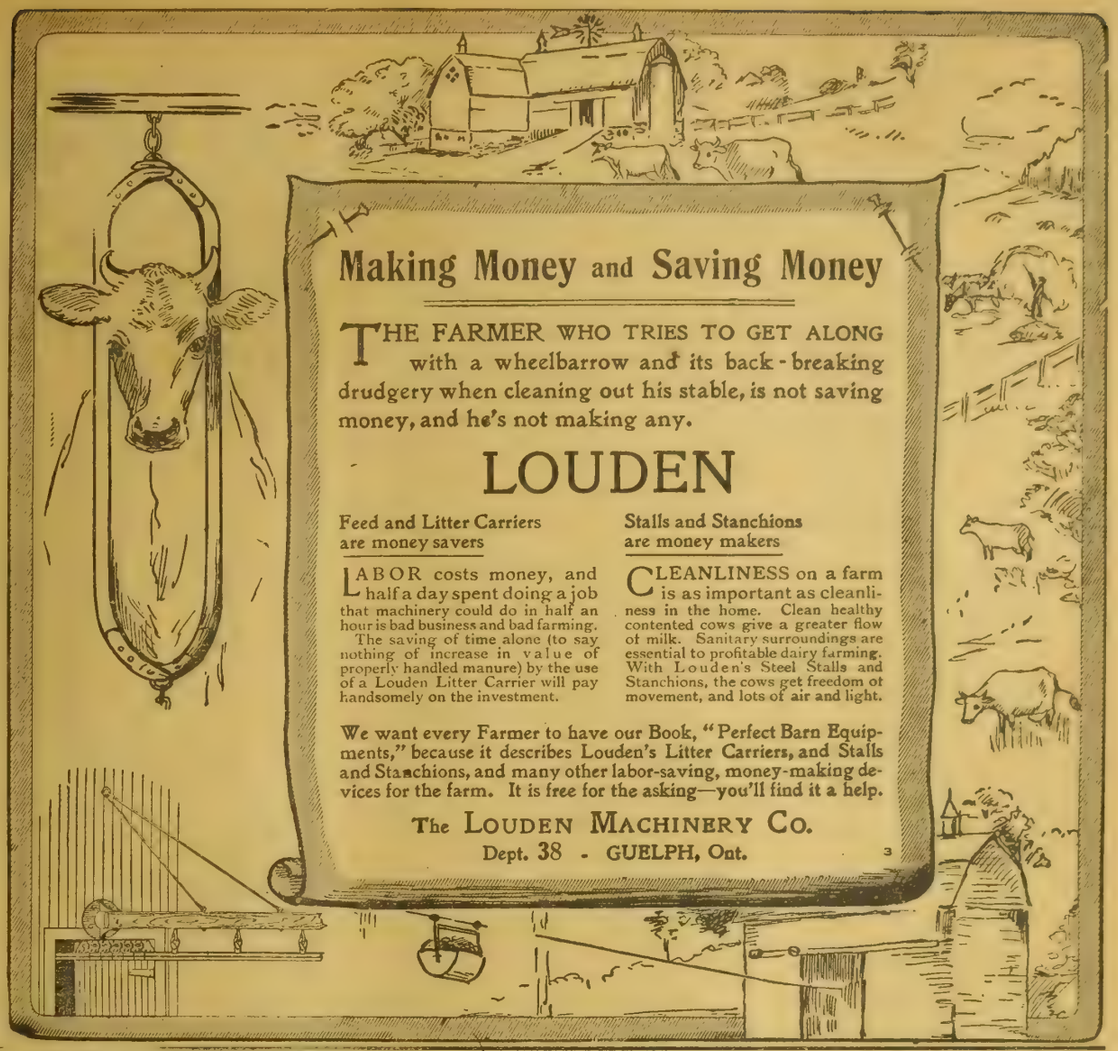
Improving a Small Apiary.

The man who has only a few bees usually lets them take care of themselves, especially in regard to their queens. Certain colonies, with apparently no better show than the rest, will produce more than others in the yard. Now that particular colony should be the one to raise queens from for all your bees.

If you desire only a few queens all that is necessary is to search out the queen of your choice colony and set her one side on a frame of brood, leaving the bees with the rest of the brood on the old stand. After 10 days go to your hive and take out the brood with the queen cells, which will by this time be capped over, and divide it up into as many nuclei as it will furnish one cell each for. As soon as the queens are hatched destroy the queens in the colonies you wish to requeen, and introduce these young queens.

If you have no introducing cages, make one by wrapping a strip of mosquito screen around the finger and tie with a couple of the loose strands. Pack one end with crushed comb, put the queen in and then pack the other in the same way. Put this cage with the queen in your hive at the same time you take out the old queen, and by the time the bees have gnawed through the comb packing the new queen will have acquired the hive odor, and will be accepted without any trouble.—Leon C. Wheeler, Mecosta Co., Mich.

When you have a cold you want the best medicine obtainable so as to cure it with as little delay as possible, Here is a druggist's opinion. "I have sold Chamberlain's Cough Remedy for fifteen years," says Eno Lollar, of Saratoga, Ind., "and consider it the best on the market." For sale by all dealers.



Making Money and Saving Money

THE FARMER WHO TRIES TO GET ALONG with a wheelbarrow and its back-breaking drudgery when cleaning out his stable, is not saving money, and he's not making any.

LOUDEN

Feed and Litter Carriers are money savers

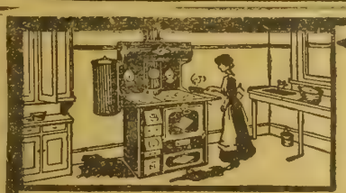
LABOR costs money, and half a day spent doing a job that machinery could do in half an hour is bad business and bad farming. The saving of time alone (to say nothing of increase in value of properly handled manure) by the use of a Louden Litter Carrier will pay handsomely on the investment.

Stalls and Stanchions are money makers

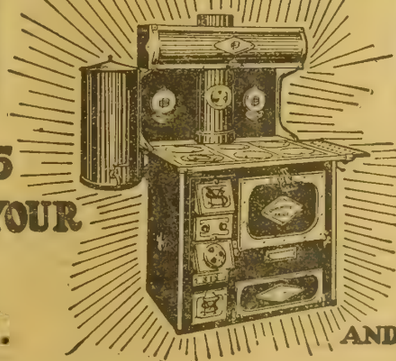
CLEANLINESS on a farm is as important as cleanliness in the home. Clean healthy contented cows give a greater flow of milk. Sanitary surroundings are essential to profitable dairy farming. With Louden's Steel Stalls and Stanchions, the cows get freedom of movement, and lots of air and light.

We want every Farmer to have our Book, "Perfect Barn Equipments," because it describes Louden's Litter Carriers, and Stalls and Stanchions, and many other labor-saving, money-making devices for the farm. It is free for the asking—you'll find it a help.

The LOUDEN MACHINERY CO.
Dept. 38 - GUELPH, Ont. 3



←DIRECT FROM FACTORY TO KITCHEN←



SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.

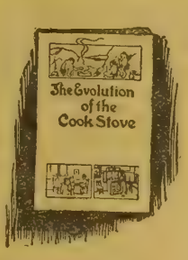
$41.00 TO $49.00 AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price

Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of tough, strong, malleable iron and the best blue polished steel—materials which will not warp, crack or break.

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it saves over 30% of fuel, burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41, or to any station in the four Western Provinces for $49—$5 to be sent with order and balance to be paid when the Range is delivered at your station. If not convenient to pay cash we will arrange to accept your note.

Canada Malleable & Steel Range Mfg. Co., Limited, Oshawa, Ont.

When writing it will be a distinct favor to us if you will mention this paper. 7

Root Culture.

In a paper regd befose the Senate Committee on Agriculture and Forestry, Mr. John Fixter, Farm Superintendent at Macdonald College, Quebec, takes the ground that dairymen and beef producers find that when roots are fed animals keep in better condition, and the flow of milk and the production of flesh increase with lessened cost. Poultry keepers and hog raisers find that when there is no grass roots form the best and cheapest substitute. There is nothing fed to animals that is more relished. Roots appear to act as a tonic and help to make all dry feed palatable. Mr. Fixter points out that the average yield of roots over Canada is 402.36 bushels per acre and that the yield secured at the Mcdonald College farm was more than 1000 bushels per acre. He goes on to describe how large yields may be secured in every province of the Dominion and then tells how to successfully harvest and store the crop. This paper, which is issued in pamphlet form for free distribution by the Publications Branch of the Department of Agriculture, Ottawa, concludes by saying that the greatest success in growing roots will be obtained when the following are observed: A systematic rotation of crops; roots to follow a fresh clover sod; manure once in the rotation; thorough cultivation in preparation for the crop and after the roots are sown.

Small Fruit Culture.

The failure of many who occupy land to grow an abundance of small fruits, at least for their own use, is due to a mistaken idea that it requires too much time to look after a garden. This is the view taken by Mr. W. T. Macoun, the Dominion Horticulturist, and expressed in a paper read by him last winter before the Senate Committee on Agriculture and Forestry. This paper, which constitutes a pamphlet of thirty-five pages, is an exhaustive treatise, expressed in the plainest terms, on the culture of small fruits The fruits dealt with are the strawberry, raspberry, blackberry, gooseberry, and the several classes of currants. Besides giving full instructions for planting and cultivation, notes are given on the relative merits of varities

This pamphlet contains an interesting table on the cost of growing and the returns from an acre of strawberries. At a selling value of five cents per box, a net profit of eighty-four dollars is shown. A section is devoted to the preparation and application of insecticides and fungicides that are useful in fruit growing. Having the information of this paper to guide him, there is no good reason why every farmer should not have a productive fruit garden. A large edition has been printed to be sent free to all who apply to the Publications Branch, Department of Agriculture, Ottawa.

Authentic Yearly Milking Records.

According to Report No. 4 of the Record of Performance for Pure Bred Dairy Cattle just issued by the Live Stock Branch of the Federal Department of Agriculture, nearly 500 cows in Canadian herds have won, on performance of milk production and regular breeding, certificates of Record of performance. This has been accomplished within the six years that the tests have been in progress.

In an introductory paragraph this report points out that while this work is of great benefit to the raisers of pure bred stock, it has an even wider influence in furnishing to the owners of grade herds reliable and valuable information to govern the selection of bulls to place at the head of their herds. The chief aim of this work is stated to be to develop and perpetuate high producing strains of dairy stock under normal conditions of management and feeding.

In addition to the rules and regulations, standards for registration, etc., this report furnishes a complete index of the owners of qualified together with the record, age, etc., of each successful animal. Anticipating a keen demand from breeders and owners of both pure bred and grade herds of dairy cattle, the Hon. Martin Burrell, Minister of Agriculture, has authorized the printing of a large edition of this report which is distributed by the Publications Branch of the Department of Agriculture, Ottawa.

Fruit Growing in the Gulf Garden.

(Continued from page 47)

The hardier varieties of trees make very rapid growth, and pests are not as numerous or as persistent as in the neighboring provinces. Dr. Bryce, one of the members of the Technical Educational Commission, who visited this Province in July, 1909, said of a young orchard owned by Mr. John Annear, of Lower Montague, that he had not seen one more promising in his travels, and a Professor of McDonald College said of this same orchard that it had two years' advantage in growth over the College orchard set out the same year.

Plums do exceptionally well. Trees from eight to ten years should yield about five bushels in a favorable season and net the owner from nine to twelve dollars a year. The only difficulty met with in the growing of plums is the black knot, but those who spray regularly do not find it serious.

Tourists tell us that there is no other place in America where strawberries are grown to the same perfection as in Prince Edward Island. They are large, firm and of excellent flavor. The average yield is 8,000 boxes to the acre, and some growers very seldom take less than 10,000. They go on the market during the month of July and do not meet competition with other Provinces. The producer generally nets from eight to ten cents per box. The growing of Bush Fruits has been much neglected. There are a few plantations of gooseberries and currants and they have proved very profitable.

For the last two years, one-half acre yielded upwards of one hundred bushels, wnich netted the owner $250.-00. There is room for a great expansion of berry growing.

The difficulty in the way of development of fruit-growing in this province has been the marketing. Three short hauls mean heavy charges, too much handling and much delay. The Car Ferry, will overcome this and fruit-growing will become a most important industry. Suitable land can be purchased at from $20 to $50 an acre, and its location, soil and climate combine to produce the conditions essential to the growth of the highest quality of fruits and will ultimately make "the Garden Province of Canada."—Theodore Ross, P. E. I., Secretary for Agriculture in Farmers' Magazine.

Canadian Seed Growers' Association.

The Eighth Annual Report of the Canadian Seed Growers' Association which is now being distributed by the Publications Branch of the Dominion Department of Agriculture, Ottawa, is replete with matters of interest not only to those concerned in the production of high class seed but to all who are interested in rural progress generally. In addition to the report itself there are included several addresses by such prominent authorities as the Hon. Martin Burrell, Dr. Jas. W. Robertson, Prof. C. C. James, Prof. L. S. Klinck, J. H. Grisdale, etc. Of special interest perhaps, is the paper presented by Mr. Rufus Stimson, Agent of Agricultural Education, Boston, Mass., on "Vocational Agricultural Education for Boys and Girls." The means adopted in Massachusetts and other States of the Union in interesting the boys in farm work and in correlating the work of the school with ordinary farm work is most suggestive and should be carefully studied by all who are interested in the more efficient education of boys and girls in rural communities.

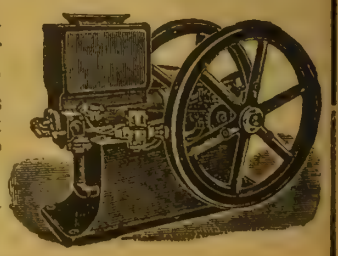
The above report may be had free of charge by applying to the Publications Branch, Department of Agriculture, Ottawa.

Let Us Help You to Get More Money Out of Your Sugar Bush

Do you know about the "Champion" Evaporator. and what it can do for you, by saving time, labor and money, and producing better sugar and syrup than you have ever had before?
Do you know that nine-tenths of prizes for maple products, at the Fall Fairs. go to users of the "Champion" Evaporators!
Do you know that no matter what size your maple grove may be, there is a "Champion" made especially for it?
Do you know that the "Champion" is the best Evaporator on the market, and that you can get one on such easy terms of payment. that you won't miss the money?
This is all true. Not because we say so, but because we can prove it, and will do so gladly if you'll give us the chance. Write us now for copy of our new illustrated catalogue free.

THE GRIMM M'F'G. CO., Limited. 58 WELLINGTON ST., Montreal, - Que.

Write Quickly---"Monarchs" Make Light Work



Cut out the hard work with a "Monarch" best-made of all farm engines. Own one this winter. You can move it around easily. It will saw wood, grind chop, pulp roots, pump water—do scores of back-breaking chores. Write quickly for easy terms and full particulars. Made in 1 1-2 to 35 horse power. By acting now you save winter work wonderfully.

This Wife and Mother

Wishes to tell you FREE How She Stopped Her Husband's Drinking

By all Means Write to Her and Learn how She did it.

For over 20 years James Anderson of 193 Spadina Ave., P.B. Toronto, Canada, was a very hard drinker. His case seemed a hopeless one, but ten years ago his wife in their own little home, gave him a simple remedy which much to her delight stopped his drinking entirely.

To make sure that the remedy was responsible for this happy result she also tried it on her brother and several of her neighbors. It was successful in every case. None of them has touched a drop of intoxicating liquor since.

She now wishes everyone who has drunkenness in their homes to try this simple remedy for she feels sure that it will do as much for others as it has for her. It can be given secretly if desired, and without cost she will gladly and willingly tell you what it is. All you have to do is write her a letter asking her how she cured her husband of drinking and she will reply by return mail in a sealed envelope. As she has nothing to sell do not send her money. Simply send a letter with all confidence to Mrs. Margaret Anderson at the address given above, taking care to write your name and full address plainly. *(We earnestly advise every one of our readers who wishes to cure a dear one of drunkenness to write to this lady today. Her offer is a sincere one.)*

The Sheep Industry in the Maritime Provinces.

(Continued from page 45)

autumn. Provided the quality of the product is kept up and improved there is very little danger of a decrease in the value of the maritime lamb, even though the supply is greatly augmented. The needs of the market already looking to New Brunswick are not readily supplied, in fact there is every probability of a constant growing demand from various quarters.

The latest available figures show the sheep stock of the province to number 190,800 head, an increase of 8,276 since 1901.

Owing to the increase of values of both wool and mutton during the past few years the larmers in some sections of the province are increasing their flocks. The use of pure-bred males is also increasing. With a view to encouraging this improvement the provincial government purchased 100 pure-bred sheep in Ontario, and sold them at auction in September, 1907. They were purchased principally by agricultural societies, who resold to members, so that they were fairly well distributed throughout the province. With the improvement that is sure to result from the better breeding, the industry is destined to go forward. What is needed is better care of the flocks in the direction of providing changes of pasture in summer and a variety of suitable fodder crops for use during the housing season. With due attention to these, the wethering of the grade males, and the judicious culling of the ewes the agriculture of New Brunswick will have a valuable branch, year by year growing in importance, in the sheep raising industry.

Requisites of Feeding.

(Continued from page 49)

gluten with a relish yet do not show proper milk flow; but an equivalent of cottonseed meal or distillers' grain will cause a noticeable increased milk flow. If you would know these things, ask the cow.

A few cows are fed for maximum records regardless of cost of production, but the feeder is only rarely instructed to know this work. His daily duty is to so know his cows, their likes and dislikes as indicated in the manger and in the pail, and so employ this knowledge as to show largest economical production. He must print the dollar-sign before every cow and read the results from the pail. And no man living can do this without pencil and scales.

We keep cows for profit. Pardon a personal reference. The writer last season assumed charge of a dairy milking 250 cows that showed a gross monthly production of $5 per cow. These cows were asked pertinent questions, and 103 were sent to the block. It was a pay-or-go game and the remainder showed a gross product of $11.75 per cow per month.

In the purchase of feeds (for what farm produces all the feed that it is practicable to feed?), first consideration should always be given to that on hand; then purchase so as to improve the ration. We are told that George Washington once threw a silver dollar across the Potamac, and that no baseball idol of today can equal that feat. We are told the reason is that a dollar would go farther in Washington's time than today. By the same token, in the purchase of supplementary feeds, make yous dollars go as far as possible. In those great sections where the alfalfa plant provides nine-tenths of all the cow eats the ration is narrow, too nitrogeneous, and the addition of carbonaceous foods is advantageous, such as the grasses, small grains or corn, while in the east feeds of a highprotein content are generally indicated. Every feeder must be an experimenter. Ask the cow what she likes best, and read your answer out of the milkflow. Ask the question so carefully and accurately and so control environmental conditions that any variation will be traceable to the feeding. In the purchase of feeds, try them experimentally first, then reduce the results to purchasing power of the dollar and throw this where it will go the farthest in udder products. It is of equal importance to count the cost of those farm-grown feeds. Use the pencil—know the cost. Institute a pay-or-go system among both crops and animals.

The cow should have about six weeks of rest, during which she should be fed liberally of easily digested, cooling feeds, as grass, alfalfa, clover, silage, bran, linseed meal, etc. But we should see to it that at the period of parturition she is fat and that her bowels have been kept lax. A good dairy worker will not get too fat in six weeks on above indicated feeds. Other more heating feeds are permissable under certain conditions, but their use may be attended with some degree of risk. For a short time after freshening she should be lightly fed. As she again regains normality her feed can be increased, but kept as a narrow ration till indications show signs of losing flesh, when the ration should be widened to cause her to retain her flesh. Feed with careful, watchful attention, and if possible, do not allow full flow of milk to be obtained till 45to 60 days after freshening. Then open the valve and drive at high speed. Keep the pencil busy, the dollar-sign bright and dust off the scales.

Feeding cows is an art of high order worthy of any man's time, closest attention and highest abilities. The art can never be loaned to the printed page. Rules are easily printed, but feeding and caring rightly for cows is a chain of exceptions to definite rules, and he is a successful feeder only who quickly recognizes and interprets these and amends the conditions to his advantage. However, the following ten thoughts are offered, hopeful that they may be helpful:

1. More cows are underfed than overfed.
2. Profit comes only from food consumed in excess of bodily maintenance requirements.
3. A large producer must be a liberal consumer. A cow has no power to create substance.
4. No man can be a successful feeder who guesses at food consumed or products returned.
5. Always use as large a variety of feeds as practicable.
6. Feed every day as nearly alike as possible.
7. In changing feeds, make haste slowly, and in such a manner as will permit definite conclusions.
8. Know the cost.
9. Cobwebs in the stable are no advantage to the cow.
10. Do unto her as you would that she should do unto you.

No bed of roses is the dairyman's lot, though roses too often thrive in the pasture. His days are long and his nights are short. His weeks are full and in his years are few holidays. His profits are not large, but his revenue is regular. But with good cows and good breeding, good feed and good feeding, clean product and clean milking—there comes good health, right thoughts, right living and long life. And when Gabriel's call is sounded and the neighbors and friends follow the solemn wagon to the little churchyard, must not all respect his purpose, his industry and his useful life? Will some one please define success?—M. M. Frisbie, California.

Harness Accessories.

(Continued from page 52)

harness makers. I always call it a brisket-strap, which describes it fairly accurately. It is best to have a wide loop at its one end, through which the girth and belly bands are passed, while its other end should be made to buckle into the breeching-stop. There is, further, the so-called neck-strap, this consisting of a broad band which goes across the horse's neck in front of the collar, it being secured at either end to the trace slots in the harness by means of a billet and buckle. The object of this contrivance is to keep the collar off the whithers, and it is sometimes resorted to when the horse is unusually liable to get this part galled by the collar. Finally we have the overcheck bearing rein, sometimes used in connection with a so-called upper jaw bit; and a special form of kicking strap, for use with double harness, which is secured to the splinter bar, to be used when a horse kicks or in breaking a young horse to go as one of a pair.—Argus.

Prevention of Damage by Frost in Orchards.

Experiments were carried out in 1911 on two orchards of 19 and 250 trees respectively. The minimun temperature recorded during the experiments was 24.7 degrees F. in the case of the first orchard, and 22 degrees in the case of the second. Temperature was kept up by creating a thick smoke by burning oil in vessels holding about three gallons each. At the first orchard 24 "heaters" were used, and eight heatings were required, the longest lasting eight hours. The amount of oil consumed was 358 gallons, or 18.7 gallons for each tree protected. At the second orchard, 200 "heaters" were employed, and thirteen heatings were required, the longest lasting 10 hours. The amount of oil consumed was 4,125 gallons or 13.7 gallons for each three protected.

With a few exceptions the protected trees of the first orchard were heavily laden with fruit, while those in the neighboring orchard beyond the range of the smoke were barren. At the second orchard apple trees did well, but other fruit trees suffered severely from frosts before the experiments were commenced.

At the first orchard the total cost of the eight heatings was 96 cents per tree; at the second the thirteen heatings cost 70 cents per tree. Importance is attached to the provision of efficient hedges around the orchard to maintain the pall of smoke during a strong wind, or to ensure an economical heating in calm weather.—Journal Board of Agriculture.

The Harvesting and Housing of the Turnip Crops.

(Continued from page 41)

should have about all the corn and turnips his cattle can consume from now on until spring.. New clover should never be pastured. About all the after grass is done. Cattle won't eat short grass when getting turnips fed on the field, and it is just as well they won't as it is good business to let as thick a bottom as possible go into winter quantities.

Not nearly enough early turnips of the Mammoth variety are grown; these grow very fast on fairly rich soil and can be sown up to the first of August, and as they set on top of the ground are very easily pulled. No other forage crop with which I am acquainted, can be handled so rapidly, which is a great thing in their favor; we grow all that our stock require for two months in the fall. There is nothing like having plenty of green fodder always on hand; it is good for the stock, good for the owner and good for the farm upon which they live.

Halifax Prices.

GRAIN—Wheat, new, 55c. to 56c., old, 59c.; Peas, round, $7.00 to $7.25 bbl.

FEEDSTUFFS—Bran, $26.00 to $27-00 ton; Shorts, $28.50 to $29.80 ton; Middlings, $29.50 to $30.50 ton; Oil. Cake, $2.30 to $2.35 bag 100 lbs.; Gluten Meal, $1.65 to $1.70 bag 100 lbs.; Corn Meal, $1.80 to $1.85 bag.

LIVE STOCK—Hogs, 8c. to 9c. lb.

DRESSED MEATS—Beef (carcass), 8c. to 13c. lb.; Beef (retail), 15c. to 24c. lb.; Mutton, 14c. to 18c. lb.; Pork, 12c. to 16c. lb.

HORSES—Drafters, $250.00 to $300. 00; Roadsters, $200.00 to $250.00; Carriage, $200.00to $300.00.

DAIRY PRODUCTS—Creamery Butter, 29c. to 30c. lb.; Dairy Butter, 25 c. to 27c. lb.; Cheese, 15c. to 16c. lb.

POULTRY AND POULTRY PRODUCTS—Eggs, 27c. to 28c. doz.; Fowl, 15c. to 16c. lb.; Chickens, 16c. to 17c. lb.; Ducks, 15c. to 16c. lb.; Geese, 15c. to 17c. lb.; Turkeys, 22c. to 24c.

FRUIT—Apples, $1.50 to $3.00 bbl.; Pears, $2.50 bbl.; Plums, 30c. to 40c. basket; Cranberries, $12.00 to $13.50 bbl.

MISCELLANEOUS—Hay, $15.00 to $16.00 ton; Straw, $8.00 to $8.50 ton.

VEGETABLES—Carrots, 40c. to 50c. doz. bunches; Potatoes, 50c. to 55c. bushel; Turnips, 85c. to $1.00 bag; Beets, 50c. to 60c. doz. banches.

Charlottetown Prices.

GRAIN—Oats, white, 40c. to 43c., black, 43c. to 45c.

FEEDSTUFFS—Bran, $27.00 per ton; Shorts, $30.00 per ton; Middlings $32.00 per ton; Oil-Cake, $2.25 per bag; Cottonseed Meal, $1.80; Corn Meal, $2.00 to $2.15.

LIVE STOCK—Butcher's Cattle, 4½ c. to 5½c.; Stockers, $18.00 to $35.00; Milch Cows, $25.00 to $40.00; Sheep, 3½c. to 3¾c.; Lambs, 4c. to 4¾c.

DRESSED MEATS—Beef (carcass), 8c. to 12c.; Beef (retail), 6c. to 18c.; Mutton, 10c. to 14c.; Pork (carcass), 8½c. to 9½c., (retail), 14c.

HORSES—Drafters, $125.00 to $200. 00; Roadsters, $125.00 to $200.00; Carriage, $125.00 to $200.

DAIRY PRODUCTS—Creamery Butter, Prints, 28½c. to 29½c., Solids, 27½ c. to 28½c.; Dairy Butter, 22c. to 25c.; Cheese 13c.

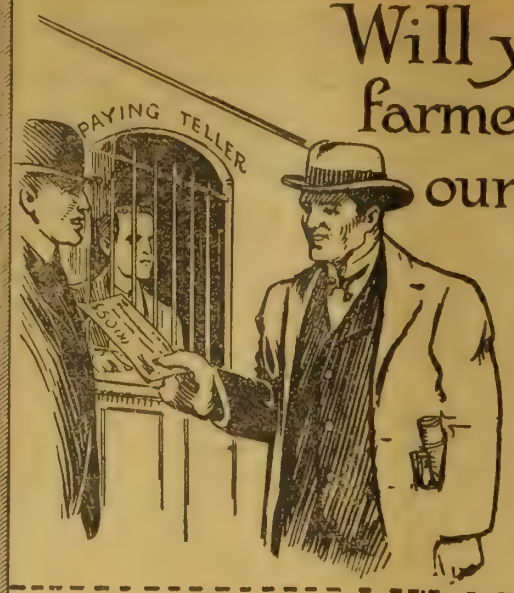
POULTRY AND POULTRY PRODUCTS—Eggs, 25c.; Fowl, 10c. to 12 c.; Chickens, 12c. to 14c.

FRUIT—Apples, $1.30 to $3.00 bbl.

MISCELLANEOUS—Hay, $13.00 to $14.00; Straw, $6.50 to $7.00; Wool, 24c.; Beef Hides, 10½c.; Sheep Skins, 75c. to 85c.; Lamb Skins, 70c. to 80c.

VEGETABLES—Carrots, 45c. bush.; Potatoes, 22c. to 25c.; Turnips, 14c. to 15c.; Beets, 40c.; Parsnips, $1.00 to $1.15 per 100 lbs.; Cabbage, 70c. to 80c. per 100 lbs.

Since last report farmers have been very busy with fall plowing and harvesting potatoes, and supply of produce is limited. White oats are in fair supply and prices firm. Black oats are scarce and prices higher. Potatoes are plentiful and market lower, other vegetables are offering freely in sufficient quantities to supply demand. Hay is scarce but prices easier and farmers are not disposed to push sales. Horses are in poor demand and beef cattle are not plentiful. Butter is high and cheese market is easy.



Will you be one of the 108 farmers who will receive our Prize Contest checks?

THERE will be twelve cash prizes in each of the nine provinces (108 in all) in the 1912 Prize Contest for Canadian Farmers. The 1911 Contest was so successful in awakening interest in the use of Concrete on the farm, that a second contest, in which three times as many prizes are offered, was decided upon for this year.

The Contest this year is divided into three classes, "A," "B" and "C," and there will be four prizes in each class. (First prize, $50; Second prize, $25; Third prize, $15; Fourth prize, $10.)

Thus there are three $50 Prizes, three $25 Prizes, three $15 prizes, and three $10 Prizes, *for each province.*

DESCRIPTION OF CLASSES

In Each Class there will be First, Second, Third and Fourth Prizes ($50, $25, $15, and $10) for Each Province.

CLASS "A"—Prizes to be awarded to the four farmers in each province who use most "Canada" Cement on their farms in the year 1912.

CLASS "B"—Prizes to be awarded to the four farmers in each province who send photographs of the *best concrete work* done with "Canada" Cement on their farms in 1912.

CLASS "C"—Prizes to be awarded to the four farmers in each province who send in the best *description*, telling how any piece of concrete work was done with "Canada" Cement. (Entries for this prize must be accompanied by photographs of the work.)

Don't think that you must use a large quantity of cement in order to win a prize. The quantity of cement used does not count in Classes "B" and "C." Many of last year's prize winners used very little cement.

When you enter the Contest, you have a chanee to win a cash prize of $50 as well as the certainty that you will add a *permanent improvement* to your farm. If you haven't a copy, be sure and ask for our book, "What the Farmer Can Do With Concrete." It will not only suggest many improvements that you can use in entering the Contest, but will tell you all about the use of concrete on the farm.

Just write your name and address on the attached coupon, or use a postal card, and we will send full particulars of the Prize Contest and a copy of "What the Farmer Can Do With Concrete" to you absolutely free.

Farm Yard Improvement.

I was talking the other day with a man who had just returned from a trip to the British Isles. He said that one of the things that most impressed itself on his mind was the neatness and cleanness of the stock yards and farm yards.

He told me that he made it a practice during his tour to visit as many farms as possible to get milk to drink.

Being an old countryman myself, it may interest your readers to know some of the conditions that exist in Scotland.

As every farmer knows, the average farm yard is one of the most difficult things to keep tidy in this world, so some of the agricultural societies give handsome prizes for the best kept farm yard. A committee is formed and one of the committee takes his turn and drops in on the farm yards at any time and gives the farmer his marks. At the end of the year the farmer with the greatest number of marks gets a handsome cup.

The average farmer realizes that the first thing to be done to keep things tidy and clean is a good thick layer of gravel all around the buildings. On many farms cement is used but where that cannot be afforded many hours might be spent hauling gravel.

I wonder if the farmer would not keep his door yard well graveled if he had to go down on his knees and clean up the dirt that is trailed into the house three times a day out of a dirty door yard?

For my own part, we are especially blessed, as we have the best of shore gravel with only a short haul, and lose no opportunity in hauling it everywhere I can around doors and yards. But if the fair committee would vote, say, $200 towards the best kept farm and door yard, it might go a long way to encourage some of our farmers to keep the yards a little tidier. There is nothing looks better than a well kept house, yard and surroundings, and it is surprising how long it takes every week to keep the place tidy. But when once tidy, it is well worth the trouble and time spent on it.—Melville Anderson in Maine Farmer.

A Few Pig Hints.

I have learned and noted the results of many trials:

1. Liberal feeding is the key to growth.
2. Park making requires more study than grain farming.
3. That sour milk as a food is equal to sweet milk.
4. That the time to make pork is during pighood.
5. That a 250-pound pig can be made during the first eight months than "if fitting for market" is left of pig life easier and at less expense until the next spring.
6. That the feeder should study how to avoid feeding "just to keep in condition," as that is a waste.
7. That it takes from one-third to one-half more food to "fit hogs for market" when improperly sheltered than it does where the stock is properly sheltered—summer or winter.
8. That from one-fourth to one-third of the grain food is gained if fed on pasture, over the feeding without growing clover.
9. That pasture and dairy wastes are not the equal of pasture and grain.
10. One should so feed on pasture that the hogs will be in condition to be sent to the early market.
11. That mixed feeds bring better results in the first eight months of hog life than the feeding of any one grain alone.
12. That all pigs should be provided shelter, but that shelter must not provide drafts or be without ventilation.
13. The growth of the pig depends upon a liberal feed with good pasture from the beginning of its life. "Liberal feed" meaning as much as it can stand and digest.
14. Breeding from immature sows or sires are not profitable in the "long run".

Test the Dams of Your Bull Calves.

Recently in these columns appeared an advertisement of several bull calves for sale. All the dams of these calves except one had made upwards of 450 lbs. of butter in one year, and that one had a grandam that had a record of the same kind. These calves were offered at a very reasonable price and we feel sure did not go begging for buyers. Publishing the record of the dam of a bull calf offered for sale is not only good for that one occasion but affords prospective buyers a place to look for future herd headers, as the demand of bull buyers for production records of dams is growing in all sections of the country.—Exchange.

Silage vs. Soiling Crops.

That cows like silage better than green soiling crops, and give more milk when fed silage, has been shown by careful experiments conducted at the College of Agriculture of the University of Wisconsin. Larger yields of silage than of soiling crops can be grown per acre, and silage may be gathered in the fall instead of in the summer when other farm work is more pressing. Two silos are now being filled at the dairy barn of the College of Agriculture. One of these is 18 ft. by 35 ft., with a capacity of 150 tons. The silage in this will be used for winter feeding, while that in a smaller one will be used when pasture gets short next summer.

ONE CENT A WORD

WANTED to buy a Yorkshire boar seven or eight months old. A. N. McDONALD, South Cove, Victoria Co., C. B.

W. H. HENRY,
Shubenacadie, N. S.

Tree Surgery.

It has been proven by at least one enthusiastic tree surgeon that trees may be mended and healed of diseases and go on to a good and useful life, when without the aid of the surgeon's knife they would perish. In care of a fruit tree that has attained bearing size, one fruitful year would repay the cost of treating it. In care of a shade or ornamental tree the value of the work could hardly be estimated as an old stately tree could not be replaced in a life time.

Decay of trees is caused by either fungi or bacteria. Some of these germs are dependent for their life on air and moisture. Other forms work under the sealing bark in the heart of the tree and may be unsuspected until the inside of the tree is largely decayed. These are the hardest forms to treat, but they may be held in check by watching for toastool growths on the outside. There is where they multiply, and by cutting these out to where the wood is found and filling the cavity with cement, the life of the tree may be prolonged for many years. This form of disease can seldom be wholly cured.

Forms that work in air and moisture may be permanently cured by cutting away as large a portion of the diseased wood as may be done without causing the tree to be too weak to withstand the wind. These cavaties are washed out with a strong solution of sulphate of iron then filled with Portland cement mixed about as used for building. This is tamped in hard that there may be no chance for air or water to get between it and the wood. In case of large cavaties small stones may be imbedded in the cement colored with lamp black to about the color of the bark. As the tree grows from year to year the bark will gradually close over it and in time seal the wound. In cutting away dead or living branches the stumps should be painted oyer with coal tar. This cleansing, healing and disinfecting stuff is therefore preferable to paint for this purpose.

Spring or fall is preferable to the growing season for this work, and there is practically no difference which time it is done, as growth does not begin till spring, provided all wounds and cavaties are painted so as to exclude air and water, one time is as good as another.

In the natural order of things trees should live to be very old. That they do not is because of disease. After years have been taken to grow a tree to either useful or ornamental size it is a distinct loss to have them die or become unsightly. Mr. Ormsbee of Vermont has given practically his whole time for six years to the renovating of old and decayed trees, and finds that it is possible to raise them after they are quite badly decayed and the work in most cases is as permanent as the original growth of the trees. If care is taken of young trees to nip all signs of decay in the bud no serious trouble will come to them. —Leigh Hunt.

Watch the Feet and Legs.

Too much care cannot be given to the legs and feet of horses. This is especially true with farm horses. Hours are spent in brushing the hair, mane and tail, but the legs and feet receive slight attention. Many horses are permanently injured because the feet are neglected. The most beautiful horse is worthless without sound limbs and feet.

Every horse should be properly shod. The legs should be thoroughly rubbed when horse is curried. Wash the legs after a hard day's work, and rub them dry. If you have any time to spare it will pay to bandage each leg for a short time after very long drives or extra hard work.

Increased Use of Machinery on Farm.

A corps of engineers has recently visited some of the farms where electrical power has in some degree displaced animal power and wind power, says an exchange. The committee reports from one farm near Dayton, Ohio, that they found three electric motors in operation, two of them devoted to pumping, anh a 15-horse power motor mounted on a truck and movable about the farm for the purpose of driving machinery.

It found that forty bushels of corn and cob could be ground in a single hour with this large motor, at a cost of 4 cents a bushel, including labour at 15 cents an hour and allowing for interest and wear and tear. The actual outgo was less than 2 cents a bushel. A six-roll husker produced two tons an hour, at a total cost of $2.85 a ton, only 27 cents of which was the actual cost for running the motor.

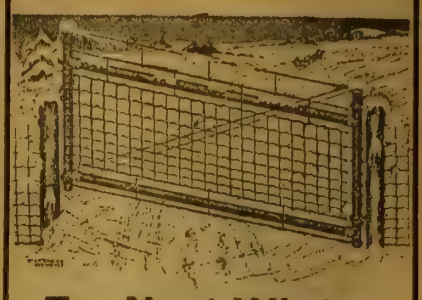
Forty-one and a half bushels of shell corn were ground in an hour, at a cost of a trifle over one cent for the power furnished. Three washers full of soiled clothing were washed in fifty-seven minutes for 4½ cents. A portable vacuum cleaner cleaned 100 square feet of floor space for 2 cents; seven horses were cleaned thoroughly in one hour, costing 3 cents for each horse, including help.

Nearly 100 pounds of butter were churned, washed and worked in about half an hour, at a cost of a trifle over 2 cents. One ton of hay was hoisted for 2½ cents' worth of power. For 10 cents a ton two tons of fodder were cut in a single hour. The committee reports a good deal further than this in the way of items, but this seems fairly to illustrate the change that is coming on in the way of farm work.

The revolution will cover small farms as well as large ones, for a 4 horse power engine can be installed for pumping and farm work and house work for a trifle over $100. The country home is in this way placed a little in advance of the city home in the way of modern applications of power.

The compressed system is more costly in the installation, but it is vastly in advance of any other system if we count in protection from fire and the forcing of water up hill. An irrigation system can be installed with compressed air that will irrigate several acres of land, throw a stream of water over a two-story house, supply water for cattle at some distance from the well, and otherwise reduce the amount of labour on a farm and increase its conveniences remarkably. It will cost about twice that of the power system. It is never dependent upon wind and is always ready for work.—Independent.

This Gate



For Next Winter

CLAY GATES CAN BE RAISED (as shown in illustation) TO LIFT OVER SNOW IN WINTER. ALWAYS EASY TO WORK. Can't sag, break, blow down, burn or rot, made of high carbon tubular steel of large diameter, and heavy wire mesh fabric.

Don't buy a Piano on the Instalment Plan Buy For Cash

Perhaps you may say that this advice is all very well for those fortunate enough to have the means to act upon it. You can buy for cash any piano or organ you wish from any dealer and thus get the advantage of his lowest cash price.

This Is How You Can Do It

When you have made up your mind what and where you are going to buy, just let us know and we will see that you get the instrument at the lowest cash price. If you have not sufficient funds to make up the amount we will supply you with the cash and charge you but 6 per cent. interest, your piano or organ will be our security.
There is not a catch about it anywhere, it's a straight above board business proposition
It will cost you absolutely nothing to get full particulars and you will be under no obligation in doing so either. Every request for particulars and every transaction is altogether free of any kind of publicity.

YARMOUTH, N. S.

FOR SALE

A well matured Guernsey bull, a handsome fellow and gentle as an old cow. A dandy sire, very active and dependable. His breeding will satisfy the most exacting, he's in fine condition as he has been well cared for. Somebody will get a great bargain as he will be sold for only a small p. c. above what he would bring on the market for beef. The figure at which he is held will put him on the cars at St. John. Full particulars given on enquiry. SARAH E. MOSES SMITH, Woodward Cove, Grand Manan.

The Wortman & Ward Co., of London, Ont., Sell Out to Beatty Bros., Fergus, Ont.

Almost every farmer in Canada has some goods on his farm manufactured by the Wortman & Ward Co. Their line of churns, pumps, washing machines, grain grinders, pea harvesters, etc., are favorably known from one end of the country to the other. In these lines the Wortman & Ward Co., is one of the largest manufacturers in Canada.

The Wortman & Ward firm is one of the largest industries in London. The industry was started in London by Mr. Wortman in 1879, in which year he came to London with a capital of one hundred hands and their factory only $350. To-day they employ over has some 60,000 feet of floor space. The growth of this industry shows very clearly how a business can be built up when the aim is to turn out the very best possible goods and to always deal fairly with the customers. Mr. Wortman was an inventor rather more than a salesman and the extended sale of his goods was owing rather more to the quality he put into them than to any forceful selling system. For many years, the business has been steadily increasing while no advertising whatever has been done and very few representatives kept on the road.

Any farmer who has used a Daisy Churn or a Daisy Grain Grinder or Wortman & Ward Pumps is well aware of the quality of the goods.

Mr. Wortman was a Methodist in religion and a great church worker. For years he conducted a profit assuring plan with his employees which was greatly appreciated by them and added much to the welfare of the business. No doubt this had much to do with the high quality of the products that were turned out. Owing to poor health he decided to dispose of his business, which no doubt will be greatly regretted by his many business associates.

The firm of Beatty Bros., who have purchased the business are well known to every reader of this paper. Beatty Bros. is one of the most progressive manufacturing firms in Canada. They fully appreciate the opportunity that a firm has manufacturing for the wonderfully growing market of this country. Perhaps, no other firm in Canada making farm tools, has grown as rapidly in recent years. The BT Hay Tools, BT Litter Carrier and BT Sanitary Steel Stalls are extensively used in this country. In manufacturing this line of barn equipment they employ one hundred men and have branches at St. John, Montreal, Brandon and Vancouver. It is their intention to continue to manufacture the Wortman & Ward lines in the London factary and it will be their aim to keep up the high standard of quality which Wortman & Ward Co.. has always been noted for.

The head office of the company will be at Fergus, Ont.

The Encouragement of Agriculture.

All of the Provinces have now signed agreements with the Dominion Government under which they receive the subsidy voted last session by Parliament for the encouragement of agriculture. The following table shows how much each Province receives:

Ontario	$175,733.32
Quebec	139,482.40
Nova Scotia	34,288.45
New Brunswick	24,509.93
Prince Edward Island	6,529.85
British Columbia	27,334.76
Manitoba	31,730.05
Saskatchewan	34,296.29
Alberta	26,094.95

BE STRONG and HEALTHY

Are You Suffering From Varicocele, Nervous Debility, Loss of Vital Power, Loss of Ambition, Early Decay? I WILL CURE YOU.

HOW MANY MEN ARE SUFFERING MISERIES FOR THE WANT OF A SIMPLE REMEDY? They do not live, they simply exist. In the faces of thousands can be read the story of a wasted life and blighted hopes, joys and pleasures are unknown to them because their vitality is being sapped. Varicocele, wasting drain, have exhausted Nature's electrical forces and left them wrecks upon the shores of life. Many have sought in drugs and patent remedies to relieve their mental and physical suffering. They are soothed for a day, or maybe a week, falsely braced up, until, the effects of the drug wearing off like the momentary bracing of whiskey, they sink lower in vitality, and, with hope exhausted, lose confidence in themselves and their fellow-man, and decide to abandon all efforts to recover their power; feeling that there is no help for them. Man, do not sacrifice yourself in this way. Do not endure this living death while Nature holds out to you relieve in the form of Electricity--that vital element of which, by a life of dissipation, you have deprived yourself---tearing down faster than Nature could rebuild. In this great restorative—Electricity—there is life and happiness for you. It restores power to the weak and indifferent; it builds up the weakened system, and by its vitalizing, stimulating cure it makes the blood jump through sluggish veins, increasing the circulation to every part, assisting nature to carry off the impure matter which clogs up the wheels of life. If you are weak and sick, don't depend on drugs any longer, but try

Dr. McLaughlin's Electric Belt

It will not fail. It cannot fail, as it infuses into the weakened parts the force of life and strength—the force which is the origin of all vital power—Electricity.

I don't ask any man to buy my appliances on a speculation. I know that it will cure these troubles, and I want my pay only when the cure is complete. I don't ask you to try it one month, nor two months, but long enough to cure you, and when I have cured you you can pay me.

DR. MCLAUGHLIN:

Dear Sir,—In regard to benefits derived from the life of your Electric Belt, would say that it has cured me of nervousness, weak back and that tired feeling. I would have written before now, but was waiting to see if the cure would last. I am quite satisfied over the results of same. Hoping these few lines will be of benefit to you, I wish to remain, R. B. McDONALD, St. Raphaels, Ont.

DR. MCLAUGHLIN,

Dear Sir—Your Belt is all you claim for it. My condition is improving every day. I have no trouble following your directions, and find the Belt is all right in every way. I cannot say more. It is a grand thing for suffering humanity—J. H. SMITH, Brigham, Que.

Call to-day for Free Test of my Belt and Free Book. If you can't call cut out and send in this coupon

BOOK FREE

Write me to-day for my beautifully illustrated book, with cuts showing how my Belt is applied, and lots of good reading for men who want to be "the noblest work of God"—A MAN. Enclose this coupon and I will send this book, sealed free.

Put your name on this coupon and send it in.

DR. M. K. McLAUGHLIN, 237 Yonge Street, Toronto, Can.

Dear Sir:—Please forward me one of your Books. as advertised.

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days — **Price $2.00 Prepaid**

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS : General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete—Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are lready a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than a2.00 each and they are a bargain at the price.

THE MARITIME FARMER, SUSSEX, N. B.

Make YOUR Buildings Fire-Proof With Steel—PEDLAR'S Way

YOU'D like to minimize the fire risk on **your** house and barn, wouldn't you? I don't believe there's a man who reads this paper who would deliberately neglect to provide every possible protection against fire? Yet why do you continue to put up frame buildings? If you think a "fire-trap" costs less you are much mistaken. Get the facts about Pedlarizing and figure it out for yourself.

Reduces fire risk fully 80 per cent.

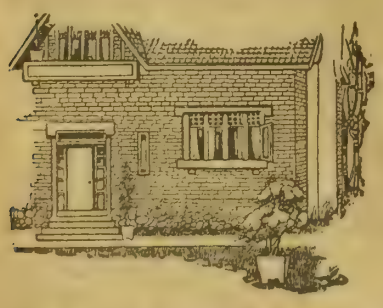
THIS means practically fire-proof. Many of the so-called "fire-proof" buildings in big cities are not so well protected against fire as your home and farm buildings would be if built Pedlar's way. Pedlarizing practically eliminates the risk of your buildings catching fire. So protects each part of the building that if fire does start it can be prevented from spreading. There is nothing about a Pedlarized building to burn, except the contents. Any fire insurance agent will tell you how much lower the insurance rate is on a building like this—enough to save a good bit of its cost.

Actually Cheaper by 20 per cent.

"PEDLARIZING" means sheathing any building, inside and out, with Fireproof Sheet Steel. Roofed with Oshawa Steel Shingles, which I guarantee for 25 years. Outer walls surfaced with Pedlar Steel Siding, to imitate brick, cut stone, dressed stone, etc. Inside walls and ceilings finished with Pedlar Art Steel—made in over 2000 beautiful designs. Such construction is actually cheaper by 20 per cent. than an ordinary frame building. My booklet makes it plain to you. Write for a copy—FREE.

Oshawa Steel Shingles Make a Good Roof For 100 Years

I give you a written Guarantee that absolutely protects you against roof troubles for a quarter-century. Just as your fire insurance policy protects you against loss, so the Pedlar Guarantee protects you for 25 years against loss through any fault of Oshawa Shingles. Nearly Fifty Million square feet of roofs in Canada protected today in this way. They cover farm buildings, homes, churches, schools, public buildings all over this broad Dominion. Cost very little, too.



Beautiful, Durable Pedlar Steel Siding

At the cost of a frame building it makes your house as staunch and handsome looking as if built of stone or brick. Pedlarized buildings, remember, are less liable to fire damage than the usual type of brick building. There are dozens of patterns. Enable you to build a strong, beautiful, safe, wind-tight, weather-proof, **durable** building with **greatest economy.** Get my book of pictures and facts.

PEDLARIZING Has Many Other Advantages--All Important

WALLS and ceiling are one unbroken seamless sheet of handsomely designed steel. No crevices or cracks to harbor dust or dirt or disease germs. Can be easily washed with soap and water just like a pane of glass. If there's been sickness in a Pedlarized room the whole interior can be scrubbed with antiseptics and thoroughly disinfected.

Pedlarizing Means a Sanitary Building

OUTSIDE can be finished to look like stone, fancy cement blocks or brick. For the inside walls and ceiling you can choose from over 2000 designs, every one the creation of an artist in mural decoration. Every taste can be satisfied, any decorative scheme harmoniously carried out. Patterns are deeply and clearly embossed in heavy sheet steel. Can be put in place easily and quickly. Never crack with settling of building—never need papering or fixing.

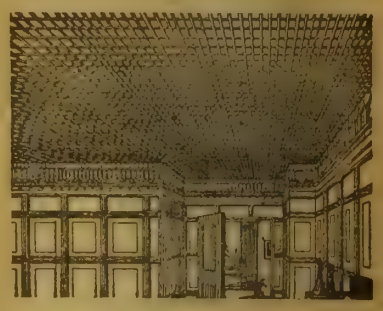
Pedlarizing Means an Attractive Building

INNER walls and ceilings wholly free from dampness—always. Will not "sweat" because there is a dead-air space between them and the Pedlar Siding of the outer walls. For the same reason dampness cannot penetrate from the outside. Frame houses and wood-shingled roofs do "sweat" and open up cracks that let in the wind and rain. A Pedlarized house is perfectly dry in all seasons.

Pedlarizing Means a Damp-proof Building

THE unbroken, seamless covering of steel keeps out the cold, and makes buildings wind-tight—easier to keep warm in winter. Think what a Pedlarized barn would mean to your stock. And in summer's blazing sun you'll find a Pedlarized house or barn the coolest—heat can't get in. Thus your buildings are kept dry and comfortable in all seasons, through all kinds of weather.

Pedlarizing Means Warmer in Winter, Cooler in Summer



Pedlar Art Steel Imperishable Ceilings

Adorn and protect thousands of Canadian homes, schools, fine churches, stores and public buildings. Because they are so much handsomer, more economical and sanitary than plaster or wood. Best fire protection, too. A plaster ceiling starts cracking almost as soon as it sets. Pedlar Art Steel Ceilings cannot crack. Seams are invisible. Hundreds of patterns provide every conceivable style of decoration.

Pedlarizing Means Lightning-Proof

Lightning costs farmers on this Continent four million dollars a year. In one year 623 people were killed and 889 injured by lightning—all on farms. Oshawa Steel Shingles would save all this immense loss. The sheer sheet steel surface of the roof scatters the electric blast and passes it harmlessly off—better than any number of lightning rods. For this reason alone you ought to roof your next building with Oshawa Shingles.

Don't Settle the Question of Materials Until You Know Every Detail About Pedlarizing.

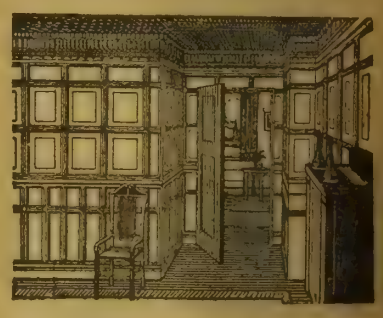
In the space of this advertisement I can only suggest some of the many advantages of Pedlarizing. You should send for my big free book, showing the newest of our 2,000 beautiful designs. Also tells how economical Pedlarizing really is.

Write for it to-day. G. A. Pedlar

Pedlarizing means Less Expense in Every Way

It costs a great deal less to Pedlarize a room, or a whole house, than you probably think it costs. Get the facts—then figure. My large, finely illustrated book shows numerous fine churches, schools, public buildings, private homes in city and country that are Pedlarized, also some of the 2000 Pedlar designs. Our nearest warehouse will gladly mail you a copy FREE.

Send Your Name and Address at Once. Ask for Our Free Booklet No.17 Write to our Nearest Address. (See below.)



Your Rooms Can Be Just As Attractive

Pedlar Art Steel Sidewalls are made in hundreds of patterns to harmonize with Pedlar Art Steel Ceilings—lend themselves to any scheme of decoration. Easily put on—beautiful to look at, easy to keep clean. Can be washed with soap and water like a pane of glass. No cracks to harbor dust or vermin. Out-last any other wall-covering. Absolutely fire-proof. Cost much less than you may imagine.

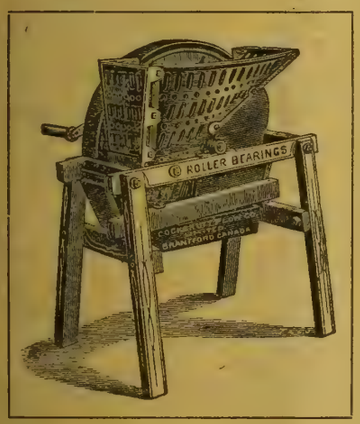
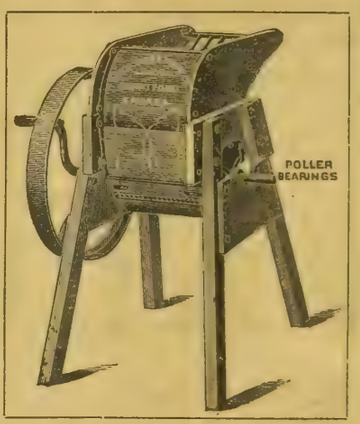
Winter Feeding Made Easy



CATTLE were never so high in average price as this year. It will pay you more than ever to get a good pulper from us now. You will get the benefit in saved labor and heavier beef immediately. For years afterwards no matter what the price of beef may be, you will have the benefit of one of these machines ; having paid for it in a season when its cost will be least felt and easiest paid.

The left hand machine has a single hopper, and reversible knives. By it, you can slice or pulp as desired. You may also buy a similar machine from us with a double hopper,, which makes easy to slice one lot of roots and pulp the next lot a minute afterwards.



The cylinder pulper at the right has roller bearings. This means long wear and easy work—big capacity. Our cylinder pulper will not bruise roots or roll them around without pulping, as the hopper is specially constructed. Inspect this machine.

Remember, this is the time to get a root cutter or pulper. You can't afford to do without one. You can buy one easily.

Write us or see our Agent in regard to any farm implements you need. A post card will bring you full information regarding these pulpers. Write us to-day

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

DE LAVAL
CREAM SEPARATORS

Cheapest As Well As Best

Every sensible person wants the **best** of everything, but in many things the best is beyond their means and they must necessarily be content with something else.

In the case of the Cream Separator however, the **best** is fortnnately the cheapest as and it is of the greatest importance that every buyer of a separator should know this.

Moreover, the **best** is of more importance in the case of the Cream Separator than in anything else, since it means a saving or a waste **twice a day every day in the year** for many years.

It is true that DE LAVAL Separators cost a little more in first price than some inferior separators, but that counts for nothing against the fact that they **save their cost every year over any other separator,** while they last an average twenty years as compared with an average two years in the case of other separators.

And if first cost is a serious consideration a DE LAVAL machine may be bought on such liberal terms that it will actually **save and pay for itself.**

These are all important facts which every buyer of a Cream Separator should understand and which every local DE LAVAL agent is glad to explain and demonstrate to the satisfaction of the intending buyer.

If you don't know the nearest DE LAVAL agent please simply address the nearest of our main offices as below.

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 18. SUSSEX, NEW BRUNSWICK, NOVEMBER 5, 1912. Number 3.

Continue the War on the San Jose Scale

Was the Verdict Handed to the N. S. Government by the Valley Fruit Growers.

THAT the Fruit Growers of Nova Scotia realize their danger from the invasion of the San Jose Scale was shown very emphatically by the size and representative character of the meeting held in Kentville on October twenty fourth.

This meeting was called by Principal Cumming after a conference with the Executive of the Fruit Growers' Association that the Government could have an opportunity of judging how far the Fruit Growers were willing to go in their desire to prevent the importation of infected nursery stock.

Representing the Government were, O. T. Daniels, Attorney General, Wm. Armstrong, Commissioner of Works and Mines, and Prof. M. Cumming, Secretary of Agriculture. Dr. Hewitt, Dominion Etymologist, Dr. Matheson, Provincial Etymologist and Mr. A. G. Turney Horticulturist for New Brunswick were also in attendance. The United Fruit Companies had delegates from each of their local companies representing some fifteen hundred fruit growers; while the old Fruit Growers' Association was there in force. In short any stranger dropping in would have no doubt but that the fruit industry meant something in Nova Scotia. Principal Cumming was appointed Chairman and Manning Ells Secretary. Previous to the meeting the delegates of the United Fruit Companies had met and agreed on the following resolution which was presented to the meeting by M. B. Davis, Secretary of the United Fruit Companies and seconed by A. E. McMahon, a member of their Executive. "Resolved that the Government of Nova Scotia be asked to take such steps by way of legislation or otherwise, as will be effectual in prohibiting the importation or bringing into the Province of Nova Scotia, of any apple trees for transplanting purposes, or nursery stock of any kind whatever from any Province of the Dominion of Canada, or any place outside the Dominion, infested with "San Jose Scale." Mr. Peck, of Wolfville, thought the resolution too sweeping. The demands of the Province for nursery stock were very great and for some years to come Nova Scotia nurserymen could not begin to supply the demand even under the most favorable conditions.

Spraying With a Modern Equipment—M. K, Ells' Orchard, Port Williams, N. S.

Mr. Fillmore said he was interested in the nursery business in New Brunswick, near the Nova Scotia line at Amherst. They had no scale in New Brunswick at the present time, but might be infected in the future along the Maine Border. If this should happen he would suffer a hardship under the terms of the resolution. He asked that the word District be substituted instead of Province. At this stage the Secretary offered the following amendment seconded by S. C. Parker, President N. S. F. G. Association.

Resolved that in the opinion of this meeting the Government and Legislature of Nova Scotia be requested to take such immediate steps by way of legislation or regulation as will be most effectual in preventing the importation into this Province of any apple trees for transplanting purposes, of nursery stock of any kind whatever that is infected with the San Jose Scale.

Both mover and seconder enlarged on their views of the situation as expressed in the amendment. The question was,—Did we wish the prohibition of all nursery stock or only infected nursery stock. Total prohibition as in the case of the potato canker and the foot and mouth disease in Great Britain was only followed as a last resort when no other treatment would meet the case. To give our nurserymen, no matter how public spirited they might be, a practical monopoly would bring its sure results of extortionate prices and greatly reduced planting. The amendment called for immediate action and left the deatils in the hands of the government as to what practical measures should be put in force. The resolution asked for total prohibition of all stock from infected countries; and the Attorney General when called upon for his opinion was not sure that this lay within the power of the Government. New legislation would be required and this would have to be passed upon by the Dominion authorities. All this meant delay and the situation would not wait.

Mr. P. Innes, of Coldbrook, then placed his views before the meeting and read some correspondence from the Ontario Department of Agriculture on the control of the pest in infected districts. He did not think the scale a very great danger and instnaced the growth of the horticultural interests in Ontario for the last fifteen years while they have had the scale with them. He called it —a blessing in disguise, but did not convince many of his listeners that they wanted their blessings disguised that way. "Why has Ontario planted two million trees in the last ten years?" asked Mr. Innes. "Because their old ones are all killed by scale," said a voice from the crowd. Mr. McMahon supported the resolution as representing the views of the United Fruit Companies, the largest and most important single body among the fruit growers. In any kind of regulation or inspection, short of absolute prohibition there was some risk that more live scales would be brought into the Province. They had before what they had been led to believe a system of fumigation supposed to kill all living pests. They had rested secure in this belief and as a result from the carelessness of some one in authority, we were now confronted by the greatest danger in our horticultural history. Where such mistakes could be made the companies did not feel that they could afford to take any more risk or try any more experiments. Prohibition of stock from all infected countries was what they asked for and would not be satisfied with anything less. He also advanced the encouragement to Home Industry Argument forgetting for the moment that a protected seller always means an unprotected buyer, Dr. Hewitt, Dominion Etymologist, then addressed the meeting. He reviewed the history of the San Jose Scale, which was first discovered in Canada in 1894 in B. C., and very shortly afterwards in Ontario. In 1898 the Dominion Government passed a law prohibiting the importation of nursery stock from infected countries, such as was asked for in the resolution. This law was not satisfactory and in 1901 it was repealed, and fumigating stations established at ports of entry. For the eleven years since 1901 till the present time there was not a single instance of live scale being found on stock passing through these fumigating stations. Their work had been perfectly satisfactory. He said he spoke from the standpoint of a Nova Scotian as to what he considered for the best interests of Nova Scotia. Would the Province be justified in prohibiting the importation of all nursery stock? He did not think so. This extreme was never taken unless no other means were available. The Dominion Government had found by eleven years experiment as he had shown, that this matter could be handled with just as certain results in another manner. He understood perfectly how the scale had gotten into the province. It was due to carelessness in fumigation. He read a despatch from the Ottawa Department of Agriculture, stating that a yearly inspection of all nurseries with a granting of a clean bill of health, only upon the advice of the Provincial Entomologist, will be enforced as soon as the necessary regulations can pass the council, all infected stock found will be destroyed and fumigation continued.

San José Scale.

Dr. Hewitt recommended that our Provincial Government be requested to pass regulations that stock should only be imported from nurseries that had been inspected and bore the official seal of government inspection. Also the establishment of proper fumigation and inspection stations here that we could have additional assurance that the stock was clean. The second fumigation would not injure the trees in their dormant state. A very lively discussion followed Dr. Hewitt's remarks. The United Companies still standing by their resolution until it was clearly shown that it would take about a year for the government to put their demands into effect. They then withdrew the resolution with the understanding that it should be considered at the annual meeting of the Fruit Growers' Association in January, 1913. The amendment was then read by Principal Cumming and carried unanimously.

Principal Cumming, as representative of the Government assured the meeting that they would give the recommendations of the Fruit Growers' their fullest consideration. The war would be carried on most vigorously on the scale already in the Province and now that they had this assurance of the support of the Fruit Growers, they would take every possible means to deal successfully with the question of importation.

A vote of thanks was extended to Dr. Hewitt for his advice and excellent address and for his interest as expressed by attending the meeting. This was one of the largest and most interesting meetings ever held by the Fruit Growers.

The industry is rightfully regarded as the premier one of the Valley and among the greatest assets of our Propince. All classes are interested in its future and all classes assemble when its problems are up for discussions.—M K. E.

Keep Live Stock and Maintain Soil Fertility.

A Plea for the Better Feeding of Stock and Soil.

By W. M. Lea, P. E. I.

The past season being most favorable for the pastures and hay crops, cattle will go into winter quarters in good condition. It behooves every stockman to take advantage of the present condition of their stock and mave serious efforts to hold this condition and keep them steadily gaining throughout the winter. When an animal is in good condition and gaining it takes much less to keep it on the gain than it does to make it pick up again once it gets on the down grade.

It is hard to understand how any one can think that there is any gain in any way in allowing young stock to go back in condition during the winter months, when so little extra care will keep them gaining. It is a sad feature of poor or careless stock management to see cattle being allowed to get into such an emanciated condition that it will take them months to recover after they are turned out to pasture. It will cost almost their full value to bring them into good condition again.

There are three classes of feeders:—

1 Those who feed a full ration to all classes of stock, whether they have to supplement the home grown feed by purchase or not.

2. Those who feed a maintenance ration or just enough to enable the various animals to hold their own without gaining in condition.

3. Those who winter their stock on whatever they happen to have at hand and who are satisfied if all survive the winter even if some may be on the lifts.

Any man's success as a stockman or as the manager of any line of business will largely depend on his good judgment and energy, particularly on the former. It is of prime importance that a man exercise good judgment in his selection of the kind of live stock most suitable to his particular circumstamces; good judgment re the number he should keep during winter, and this must be governed by the quantity of feed he has at hand. All these things must receive due consideration but whatever number of stock he attempts to winter, he should start with a determination to keep them all growing and his milking cows giving a full flow of milk. Fat stock and young stock should be putting on flesh at a most economical rate.

Be assured that when the ration is once cut down the animal ceases to grow or gain in any way so that we are feeding at a loss when the reverse might be the case and a handsome profit reaffized bv being a little more liberal with the feed.

Granting that the less feed a farmer has to buy the better it will be for his pocket book, but circumstances arise at times when he will find it to his advantage to replenish his stores by purchasing and when such circumstances arise he ought not hesitate

In this province, and probably to a lesser extent in the other Maritime Provinces as well, it is considered a discredit to a farmer to have to purchase feed. Old prejudices die hard. Nothing is so persistant as a popular delusion among farmers. They are supposed to have produce for sale at all times. When a farmer is known to buy feed the supposition always is that "he cannot be growing much." I have heard men tell with seeming pride that they never had to buy a pound of hay. it matters not to these how few the number of their live stock may be or in what an uncreditable condition they come through the winter so lomg as they do not have to buy extra feed. Farmers of this type never seem to worry whether they lose or gain by sticking to their hard and fast rule. They do not hape to buy that's all.

Now, it is quite possible to get over enthusiastic over the present high prices for butter, beef, fowl, etc., and undertake to feed heavier than will prove profitable, or, in other words to bite off more than we can chew.

And here we learn to strike the happy medium, circumstances alter cases. The man who has a large holding of cheap land, whose pasture costs him little, may depend more on summer conditions rather than on winter conditions to grow his stock. I cannot, however, understand why any animal should be allowed to lose weight.

Young stock coming off the grass in good condition, should, for a time at least, be put on a somewhat better ration than they may do with a little later,when they become accustomed to the change. To put them at once on three feeds of straw, as is often done, is a most foolish economy. Turnips can be easily grown and at least one-half bushel should be daily given during the first month, even if they must be cut down afterwards. Violent changes are always disastrous. Stock would be rarely sick if good judgment were used in making feed changes.

If the class of stock is of some good grade class, as at least it should always be, it will always pay in the end to provide sufficient to keep them gaining. It should always be the rule to keep everything that is or should be growing on the gain during the entire year. If at the beginning of winter we have not enough feed on hand to accomplish this, we must do either of two things, look out for some right feed or cut down the numbers of the stock.

Its remarkable to note the premium most farmers put on the dollar that can be realized right off this fall or during the next few months. How generously they will grain the hogs—animals that are shortly to be sold. How stingily they will feed the incalf heifer that is to stay with them for

eight or ten years, and whose first pregnant period will largely influence her profitableness for years to come. While I am not objecting to the keeping of hogs, and they are always supposed to fit well with dairying, I think that on P. E. Island at least, the hog industry is a positive injury to dairying. At least that is how it seems to work out, when pork is high, and it usually is high for a few weeks when the litters arrive in the spring. Most men will start in with more than they should attempt to carry, and when they once start them they must be finished to get sale for them, regardless of what other animals are robbed of their rations.

I spoke to a man recently about graining several heifers, bred to calve in November and December, that were out on short pasture. He assured me he did not have the oats to spare, as what he did grow would be needed to carry him over winter. When I intimated that he seemed to have plenty to spare his bunch of hogs, he replied that he just had to fatten them to sell them. The hogs would no doubt bring him some profit and he could carry them and also grow and develop the heifers as well, by buying a little feed, but as it goes now farmers seldom buy feed, and never in the fall when it is reasonably cheap. The hogs get the first turn, then the milch cows may get a little, that is when they are milking, but the vast majority of mixed farmers, who are always generous hog feeders, will usually sacrifice their cattle to finish off the hogs.

Creamery butter is now selling for 29 cents, with prospects for an advance. Oats sell for 42 cents; loose hay sold out of the field in this vicinity for $10.00 or less per ton. Oil meal can be purchased at $40.00 the ton; cotton seed, $37.00. Turnips and corn can be grown in abundance and wages are lower than in any other part of Canada, yet cows forward in milk are offered in numbers, and our hungry soil and the scarcity of even those who complain most about manure cannot see any great advantage in going into winter dairying We have sections of country where the land has been exhausted by continuous croppiog with oats, and where now fair crops grow only in such favorable seasons for this crop, as was 1912. Where the farmers are now busily hauling their oat crop to the shipping points nothing can persuade them to engage in winter dairying. It seems their cows cannot pay a profit on their feed; that is, the cows must milk first and they will feed them after they prove themselves.

The Department of Agriculture is doing good work in establishing and helping to maintain Farmers' Institutes, but the trouble is that few of the farmers, who need assistance most will become or continue members of these organizations. Through these Institutes the use of good pure bred sires of the different classes of stock can be cheaply secured by every member and many are taking advantage of this; but far too many take little or no interest in grading up their flocks or herds.

Surely everybody understands the necessity of maintaining the fertility of our soil, and the wonderful possibilities that are open to the man who continually increases the number and quality of his stock by returning everything again to the soil. If it is possible to secure as much for our grain by feeding it to any class of stock as by selling it in the raw state and at the same time receive a quantity of valuable manure, is it not good business to do so? I think every farmer will agree that it is, and when they don't practice it they cannot believe that it pays. This is the problem for our agricultural teachers to convince the majority who are now largely shippers, that they must change their methods. Look at the press reports and watch the number of cargoes clearing from the different shipping ports to see what is yet going on. P. E. Island is yet a shipping country. It is amazing what this little Island can sell off and yet grow more to sell. P. E. Island is said to possess a hungry soil, and it has good reason to be hungry. If it were not for the immense quantity of naturally occurring fertilizers such as seaweed, mossel, mud, etc., the country could not stand it as well as it does. Good farming is practised in some sections and stock raising is the main source of revenue; but in the vast majority of farms the cattle now going into winter quarters, will be carried over at a loss to their owners, simply for the want of a little extra feed, a loss that will be felt during the coming season, and for many season to follow.—W. M. Lea.

Forwarding New Brunswick's Agricultural Policy.

Following the resignation of Mr. W. W. Hubbard, Secretary of Agriculture for New Brunswick, who has taken over the Superintendency of the Dominion Experiment Station at Fredericton, Mr. J. B. Daggett, of Carleton County, has been appointed as his successor. We look for good things from brother Daggett, who is a born diplomat and the possessor of more than average ability in executive powers. He has that foresight in public assembly that will discern disrupting factions before they have a chance to work any injury to a good cause and by exercising a little judicious diplomacy "oil is thrown on the troubled waters" and thus stormy sessions have frequently been transformed by him to follow the paths of peace and harmony.

Knowing Mr. Daggett as we do, we feel confident that he will do all in his power to make matters go as smoothly as possible in agricultural ranks. Although Mr. Daggett trained for a theological calling, he has been of the kind who feel that it is not infra dig to look after the temporal as well as the spiritual welfare of his people. He has been interested in the Hartland Poultry Yards for quite a number of years. Their winnings at our various provincial and inter-provincial shows is well known to all our readers. Stock raising and other agricultural operations were not neglected on the Hartland farm. Mr. Daggett is a regular attendant at the Maritime Winter Fair and always takes a deep interest in the agricultural discussions at the various conventions there held. In his present position we feel that he will give the best that is in him for the advancement of the cause he represents.

In the course of a short time another official, Superintendent of Agricultural Societies, will be appointed. His work will be along the same lines as the work that is now being done in Nova Scotia by Mr. F. L. Fuller. This is another step in the right direction. Our readers know the added vigor that Mr. Fuller's work has put into the Nova Scotia Agricultural Societies.

Premier Flemming has recently announced that it is the intention of his government to establish two agricultural colleges in the province—one at Sussex and the other at Woodstock. We had hoped that he would work for the establishment of a Maritime Agricultural College—in unity there is strength. However, we do not know to what standard of excellency the proposed colleges will attain. We persume they will simply mean the addition of one or two agricultural teachers to the staffs of the excellent schools already boasted by these towns. In this case these schools will act as feeders to the other agricultural colleges, and it may be that at some future date both New Brunswick and Prince Edward Island will join with Nova Scotia in the maintenance of a thoroughly equipped Maritime Agricultural College, and a staff of men capable of doing a lot of original research work for the various sections of the Maritime Provioces.

Fruit Growing in Canada.

A year ago the Deuartment of Agriculture at Ottawa, through the Branch of the Dairy and Cold Storage Commissioner, undertook an investigation of the fruit growing conditions throughout Canada. The quiry was intrusted to Mr. Wm. H. Bunting, an extensive fruit grower of St. Catherines, Ont., who secured as much information as possible on the following points:

1. The possibilities of an extension of the fruit growing industry of Canada in the different localities visited.

2. The tendencies in the matters of the planting and growing of different kinds of fruit, and with regard to apples, the varieties which are being most extensively planted in the different districts.

3, The difficulties which are likely to be encountered in the further development of the fruit growing industry.

4...Methods of production and orchard management which have been most successful in the different districts and the probabilities of over production.

5. The conditions under which British Columbia, Ontario, and Maritime Province fruit is marketed in the prairie provinces as well as the character and the effect of American competition.

The enquiry was concluded in due time and the report has been printed for general distribution. It contains a large amount of detailed information gathered in every province making it an invaluable guide to persons who desire to take up fruit growing as an industry.

In his general conclusions Mr. Bunting points out that while the growing of fruit offers ample reward to the man of energy, patience and perseverance, there is perhaps no phase of agricultural endeavor which requires to be more closely studied and in which a wider range of information is more desirable and necessary. The future of the industry he states, was never brighter that it is today, the prospects never more attractive nor the field of extensive effort in all fruit growing provinces more inviting.

The report which contains eighty-four printed pages and many illustrations is available to all who apply for it to the Publications Branch of the Department of Agriculture, Ottawa, Ont.

Salt for Domestic Animals.

Some farmers do not realize the importance of providing plenty of salt for all the different animals kept on the farm. Experiments have been conducted at some of the stations, by depriving a certain number of cows of salt for a short time, and they showed a marked falling off in milk, and when the same cows were given a regular supply of salt, the milk was soon increased to normal. If salt is kept where each animal can have daily access to it they will only eat what they need to keep them in good health; but if deprived for any length of time, some will eat so much at once as to be injurious. This is very apt to be the case where salt is supplied at intervals. It is a fact that some animals eat and seem to require double the amount of salt that others do. I have one horse that eats over one quart of salt every week, which is double the amount the other two eat. It is a very good plan to make a box in one corner of the grain manger and keep this filled with salt so the horse can eat just what he needs every day. It is the same with cows, there should be some way provided so they can have daily access to salt in the stable. Where it is the practice of giving the cows salt perhaps once a week, and throwing it out somewhere on the ground, they will not do near as well, and then, too where salt is given to cows in this way it is apt to be forgotten and cause suffering as well as loss. It will do very well to salt sheep in this way, when running in pasture, but it is not a good way to manage with cows and horses.

Stomach Worms in Sheep.

The following is a receipe for stomach worms in sheep:—Arsenic, 1 oz.; carbonate of soda, 2 ozs.; boil in about a quart of water until dissolved. Pour off and keep the clear liquid; bury any sediment which may remain and make up the liquid to 3 gallons with water. The dose of this drench for a grown sheep is 2 ozs.; for a six-month lamb, 1 oz.; and for a nine months, 1½ ozs. This gives a dose of two grains of arsenic to a grown sheep, with a decrease for young

Sheep should be brought into the yards the night before drenching, as sheep according to their age.

it will be found to be more efficacious if given on an empty stomach. Care is necessary in the operation, for unskilful drenching is more common than may be supposed. The sheep should be either standing naturally an all four legs, with the head slightly raised, or sitting on the haunches. The head should not be forced too far back, nor the drench given too hurriedly, as choking may result.

After the drenching, keep the sheep in the yards for two or three hours, and allow no water in the meantime. Another administration is necessary in about a fortnight, and a third is sometimes advisable.

A salt-lick should also be provided (in fact, one should be supplied for all sheep on the coastal or tableland areas.) For worm-infested sheep the following lick is prescribed.— Sulphate of iron, 1 part; bone meal or calcium phosphate, 5 parts; Liverpool salt, 30 parts. The lick should be supplied in suitable troughs where it will be protected from rain, as if exposed to the weather much is lost and wasted.—Pastoralists Review.

Holstein Cattle Arriving in New Zeland

The Makura which sailed on September 23. brought the third consignment of Canadian Holsteins for New Zealand. This lot consisted of 10 heifers and 1 bull. They all arrived in good condition, and were transferred to quarantine island. Those which arrived on previous shipments endured the quarantine test and have all passed into their new homes with the exception of 1 bull. This animal contracted a cold and will be detained a few days longer.

The last shipment came from the herds of Thomas R. Pearson, Port Hammond, British Columbia; A. C. Hardy, Brockville, Ont.; and Logan Bros., Amherst, N. S. This latter circumstance is worthy of mention, that cattle can be shipped from Nova Scotia to New Zealand at a profit.

Mr. Logan personally accompanied this shipment, and his sales were determined by the capacity of the accommodation on the Makura. Eighteen animals were sold, but only eleven could be accommodated. The freight rate from Vancouver has been raised to £20 per head from £15 as formerly.—W. A. Beddoe, Canadian Trade Commissioner, New Zealand.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

DATES OF ISSUE.

November 5-19
December 10-24

FIRST CALL TO THE MARITIME WINTER FAIR

The Twelfth Maritime Winter Fair will be held in Amherst, N. S. on Dec. 2nd, 3rd, 4th and 5th. Intending exhibitors must make their entries on or before November 14th. In presenting the twelfth premium list to the public the management say:

"From the beginning, each Winter Fair was better than the previous one.

"The Eleventh one was no exception. A new dairy stable which had been provided for the accommodation of thirty cows was filled to overflowing, and although the prizes had been extended, many cows which more than qualified for first prize, had to be contented with "Highly Commended."

"This year, however, the Federal Government has increased our grant, and the prizes in most classes have been increased and extended.

"Public spirited men still generously aid us in making our show popular, and the citizens of Amherst are ever ready to give visitors a welcome.

"Two new hotels have recently been opened and there will be abundance of accommodation for visitors.

"We are arranging to have some of the most prominent men in Canada deliver addresses during the Fair.

"Transportation Companies are again offering low rates.

"Come and see our 1912 Fair. After seeing one Fair, you will become a regular visitor."

WORK BETTER THAN WORDS

There is an old adage that those who live in glass houses must not throw stones. This means that it is safest to leave the mote in our neighbor's eye severely alone until the beam is cast out of our own, then we can see clearly to remove the mote from the eye of our neighbor.

It is true that if we waited for some one without sin against modern agriculture to cast the first stone, reform would come slowly, indeed, for there are few sinless in this respect. But we should show our faith by our works. Before we denounce sloven farming we should remove the weeds from the fence corners of our own farms; we should beautify our own homes before we start the crusade in the neighborhood; we should take the initiative in work before we do it in words.

The example of a progressive farmer has a powerful influence in the community. A stranger can soon find out who are the most surcessful men in the community, for he is sent to these for information. The community will recognize successful effort, even though it may be reluctant to follow the successful man. Human nature is much the same everywhere. Men may envy their neighbors because their neighbors excel them in special lines, yet when it is found that the experience and advice of the successful are profitable, these will be sought.

The leader will generally be the man that does things. He will be the man who has left the beaten path to blaze one of his own; he will surmount the difficulties that the average man is afraid to encounter; he will be the man who has succeeded where others have failed.

There are many men claiming to be successful whom the world will not recognize in this class. The man who accomplishes results by his efforts does not as a rule need to proclaim the fact to receive the plaudits of his neighbors. The laborer is worthy of his hire. Work, not words is what makes leaders; results, not theory, is what people seek; achievements, not boasts, make character.

DRAFT HORSES ALWAYS SELL BEST

About the horse market the comment is constantly made that draft horses are the best sellers. This statement has already become commonplace. Anyone conversant with horse market activities would be surprised to hear any other assertion and yet the fact remains that farmers are not producing top-notch draft horses in any considerable number. Judging by horse market receipts and a search of the countryside, farmers have a comparatively small appreciation for the advantages of breeding the largest horses.

The fear of displacement by motor-trucks has some influence on farmers, but really motor power is not displacing the class of largest horses to any great extent. Dealers assert that motor-trucks have cut no appreciable inroads into their orders for first-class draft horses. Those who require the best teams pay almost any price in order to satisfy their requirements.

As a consequence those farmers who are attempting to produce the right kind have not only the best possible present market, but very luminous prospects. An urgent demand has arisen this fall for the very best kind of draft mares. Every one of this sort would find a prompt buyer if offered for sale. Usually when one is located, inquiry reveals the fact that the owner is determined to keep her.

THE BOY AFTER SCHOOL

It is a fine thing for a boy to have some regular work after school, though it ought not to take up all his time by any means.

This work is generally in the line of regular "chores," and is looked upon with ill-favor by even an ambitious boy. Vary it, if you wish that boy to get an idea that he likes farm work.

Give him a written formula for preparing whitewash, and let him whitewash the chicken-house, the cellar, the stables, or such part of them as he can reach. He will do it as well as any one, and will grow an inch or two from sheer importance and delight.

Let him spray the hen-houses with a kerosene solution occasionally. He will generally consider spraying the cows in fly-time much more fun than milking. If he does it satisfactorily, why not let him do it?

He will occasionally enjoy oiling the harness instead of brushing the horses. Change off with him once in a while.

It is an excellent plan to send him to transact business sometimes. He may make mistakes, but he will be learning each time. And each time he learns he will get ambitious to do greater work. And so he will come to be useful.

Let him experiment in setting out vines and trees about the place. It is a valuable experience, which may result after a while in improving place with fruit and fine shade.

Give him a corner of good ground for experimenting, if he enjoys that sort of thing, and help him a little when needed.

See that the boy has sufficient honest work after school, but vary it enough to make it interesting, and there will be fewer boys "despising" the home farm work and leaving it for some on? else.

HONEST MARKETING METHODS

They tell a story in one of the Southwestern states about a bunch of strawberry growers who, while loading a car one hot day, decided it would be a great joke on the railroad company if they helped themselves to the ice which had been placed in the cars to refrigerate the fruit. When the car reached its destination, the berries had become white with mold. Of course, the buyer refused to accept such a car, and the joke recoiled upon the men who grew the fruit.

Such practices indicate a lack of social consciousness. No doubt, if the story be true, the men who loaded the car did not think they were doing much harm by "swiping a little corporation ice." Yet, in the language of the law, they were committing theft. Their deed very justly recoiled upon their own heads; they reaped the reward of dishonesty.

There is another kind of stealing—one just as bad as stealing ice. That is to slip inferior fruit into a package and attempt to sell the whole for first-class stuff.

What do you think of the clothing man who sells you an "all wool" suit containing 40 per cent. or more of cotton? What do you think of the seed dealer who palms field-run seed off for carefully selected varieties? What do you think the buyer thinks of the man who faces a box of apples, a basket of peaches or a crate of strawberries with good fruit and puts culls into the middle, or the dairyman who waters his milk?

Prosperity that is permanent depends upon honesty of purpose. Let us have sincerity in packing our packages. Avoid tne insincere man, wherever he may be, in whatever occupation he may be engaged.

Insincerity has its own reward. Inferior packs are always found out. Once stung, the buyer becomes suspicious, and will discriminate against the whole section from which one grower has sent a fake pack. But that is not the big reason for honest packing. The big reason is: Pack conscientiously because it is right to do so.

THE FIT SURVIVE

It is strange that anyone should claim to know all about farming, which is one of the broadest and deepest subjects among men. When we contemplate what might be accomplished in plant growth and animal breeding if men knew, we are apt to be overwhelmed with the ignorance of men upon scientific agriculture. And yet occasionally one may be found who thinks that he has learned all that can be learned about farming.

"Where ignorance is bliss it is folly to be wise," because those who do not know and think they know avoid the light of knowledge. But the ranks of those who distrust the "book farmer" are growing thinner every year. The influence of the agricultural press, the experiment station, and the agricultural college are thinning the ranks of the "unbelievers." Those who are not willing to learn are moving to town to swell the ranks of the unemployed and to place greater responsibilities upon the producers of this nation's food. It is a case of the "survival of the fittest" where the unfit will be eliminated and the progressive only will survive.

"Forward to the city" and "back to the farm" is an economic balance that will and must maintain our industrial life and supply of food, clothing and shelter for our rapidly increasing population. Only those who learn how to farm may be expected to have a home in the open country and maintain the country's wealth in agriculture and foster our democratic ideas of government.

CAN YOU BEAT THIS RECORD?

While visiting at Homestead Farm recently we saw a grade Clydesdale mare out of whom over $1,000 worth of foals had been sold before she was 10 years old. Is not this a strong point in favor of the breeding of the right kind of draft horses in the Maritime Provinces? Can any one of our readers beat this record?

There are yet people who hope to prosper by keeping town people and country people "at outs,-" but these are usually men who are drawing salaries for their work, and their motives are known. They can do little harm where their motives are known.

A Suggestion for Improving Dairy Herds.

"It is alleged" says Dr. A. S.Alexander, of Wisconsin, "that more than 90per cent. of the bulls in use in the dairy districts are grades and scrubs. This lamentable state of affairs indicates plainly that the results of forty or more years of writing, teaching, preaching and persuading against the use of such males are unsatisfactory and that the practical plan of actual improvement should now be introduced. Only by the general use of pure bred dairy breed bulls can dairy cows be graded up and improved in quantity and quality of milk production. The general use of such bulls and employment of better methods of feeding and management would in a comparatively short time increase the present yearly average butter production of the average cow from 175 to 350 pounds or more. Two top crosses of dairy breed blood have produced a grade cow that yielded 630 pounds pf butter in one year. Some scrub cows produce only 90 pounds butter a year. The 175 pound butter cow hardly pays for her board and care. The 90 pound butter cow is kept at an actual loss. Only profitable cows should be kept.

"Pure bred bulls would be used were they everywhere available. They are not available now. They should everywhere be made available. This should be accomplished by the use of creamery company capital. It would be a legitimate and profitable investment of capital.

"The parties vitally interested in this matter are the producer of milk and the buyer of milk. If the producer had better cows, sired by pure bred dairy bulls, he would keep more and better milk at a greater profit. This would mean more and better supplies and better profits for the owners of creameries, cheese factories, condensing factories, skimming stations and milk distributing stations.

"The creamery and factory owners should buy pure bred bulls and maintain them where they can readily be used by their patrons. The service fees, calculated at cost, could be deducted from the patrons' creamery checks. The danger of the disease being spread by the bulls would be slight and easily prevented by sanitary precautions. All male calves produced should be vealed. All heifers should again be mated with pure bred sires. Continuous grading up should be done and no cross breeding practiced.

"Such introduction of pure bred bulls would quickly eliminate grade bulls,
and scrub bulls, set the right example, encourage owners of dairy herds to own and use pure bred bulls and in time lead to the ownership of pure bred dairy cows by the creamery companies. Wisconsin needs and should put into practical use every pure bred dairy bull produced in her domain. Hundreds of such bulls are now sold out of the state each year. The plan proposed would lead to the home use of all of the bulls we produce.

"Let us stop merely advising the cow owner to use a pure bred bull, place a pure bred bull where he can use it and then get him to use it. If this is done improvement will be sure, rapid and profitable."

Railway Ties.

In 1910 eastern cedar composed 40 per cent. of the total number of cross ties purchased in the Dominion; in 1911 it fell to 5.4 per cent. and to fifth place in importance of species used. Its place has been taken by jack pine of which wood 40 per cent. of the trees used in 1911 were made. Tamarack, with 19 per cent; Douglas fir with 14 per cent, are the three next in order.

The Forestry Branch of the Department of the interior, which is authority for the above, states in its bulletin on the subject that 13,653,770 ties, or 4,469,808 more than in 1910, were purchased in 1911. Railway development in the West is largely responsible for the increase.

The average price per tie was 39 cents. The United States furnished the most expensive kinds,—Southern pine at $1.10 and white oak at 81 cents apiece. These latter were used largely in switches.

In 1911 the sawn tie stood ahead of the hewn tie both in quantity used and price, 70 per cent of the total being from the mill. The cost was 41 cents apiece, or 4 cents more than the hewn tie. 6

An interesting estimate of the amount of timber which could be saved by preservative treatment is given. Creosoting makes the initial expense per tie about 93 cents as compared with 58 cents for the untreated tie. taken from the fast diminishing tim-However as the length of life is extended by ten years, the economy is two cents per tie per year. This would mean $1,400,000 per annum, to say nothing of the vast quantity (estimated to be 350,000,000 feet board measure annually, which is being ber supplies.—Forestry Branch, Department of the Interior.

Co-Operative Creamery for Antigonish County.

Editor Maritime Farmer:—

Another new co-operative creamery company has been organized in Nova Scotia. This is the result of some dairy meetings and active work by a few enthusiastic people during the past summer.

The new creamery will be located at the northern end of Loch Katrine, a most beautiful lake, about two miles long and from one-quarter to one-half mile wide, which is located in the heart of a rich agricultural district, that with further development and hearty co-operation among the people will make one of the most prosperous communities to be found anywhere. The natural conditions are all favorable and the people are now entering into the new scheme with a vim and optimism that spells success.

It is not the intention to make this creamery merely a place for manufacturing butter, but a co-operative institution in the community whereby the farmers will, in a co-operative way, handle practically all the products of the farm, in selling potatoes, vegetables, lambs, etc., and in buying seeds, fertilizers, wire fencing and other requirements.

Co-operation along these lines will probably be commenced in the early spring. It is the intention of the company to take over the business of a number of small cheese factories that are now operating in the district.

The company will be incorporated under the name of the South River Creamery Company, Limited, with its head office at Loch Katrine, N. S. and will be under the direction of a strong board of directors and with the support of the people is bound to be a success and a strong incentive to better farming and increased interest and optimism in that part of Nova Scotia.—W. A. McK.

A Patriotic Effort.

Mr. John A. McNeil, well known in building circles, but who has spent several years away, living in the midst of a great farming district in the American West, is back in Cape Breton, and has a project for the improvement of farming conditions in Cape Breton. Mr. McNeil is very enthusiastic over the agricultural possibilities of his native country, and he is giving practical proof of his belief in it. He has purchased seven hundred acres of land in Victoria County, near Baddeck, and has brought with him a number of men, mostly from Quebec and New England, to work it. The farm will be divided into lots of twenty or thirty acres, one man working each.

"We can get a large number of farmers here from Vermont and Massachusetts," said Mr. McNeil. "All that needs to be done is to advertise the Island. A large number of these people are native sons, who left here years ago, and they would be glad to come back with their families. There is splendid farming land, and abundance of it, and all that is needed is some hearty booming to place the advantages of the country before the eyes of these people.-'

Mr. McNeil compares the East and West, and is emphatically of the opinion that the East has more to offer the farmer. "The farmers of the East," he says, "live in luxury compared with those out West, who tie themselves down to one or two products, while the easterners go in for variety. The East, in fact, has many advantages, The farms are generally well-wooded, which saves the expense of buying coal, a big item in the West. Then they are very near a good market, and connected with it by rail or boat."

Mr. McNeil is undertaking a work which is patriotic in the true sense. He will endeavor to show what can be done with Cape Breton farms and to bring back the stalwart sons of Cape Breton whom the United States has been taking away from us for years. We have no need of immigrants to come and work our vacant farms, if even a small part of our own comes back to us. It is sincerely to be hoped that Mr. McNeil may be wholly successful in the laudable enterprise he has undertaken.—Maritime Merchant.

Varieties of Fruit for Victoria, N. B.

Editor Maritime Farmer:—

Will you kindly tell me through the columns of your valuable paper what is the best early variety and the best late variety of strawberries to plant in northern N. B.? What is the best variety of blackberries? Can pears be grown in this country and if so what variety? What kind of plums would do well and do you think we could grow the Baldwin apples?—L. S. E.

The Senator Dunlap is a good early strawberry and the Glen Mary is a good late variety. Both these varieties are perfect. For blackberries I would recommend Agawan or Snyder. I do not think it would be advisable to try pears in your district. For plums I would recommend only the Moore's Arctic. I do not think that the American Baldwin apple would grow in that section as it is too tender, but Canada Baldwin would probably be hardy and yield well. A. G. T.

United Fruit Companies Charter Their First Steamer---Loading Her in 30 Hours.

Such a rush has been going on in the company's warehouses during the past fortnight that in order to relieve the congestion, outside steamers have to be chartered. This is contrary to what the management anticinated. It was thought on an off year, with the regular weekly service to London, the direct line to Liverpool and the fortnightly calling of the Allan line for Glasgow, that the steamship companies would be able to handle the situation. However, such is not the case for the united fruit companies are packing at the rate of over 3,000 bbls. of apples per day.

On Thursday last the S. S. "Salvatore Di Giorgio-' was dispatched to London with a full cargo of apples being loaded entirely by the united fruit companies of N. S. Although the companies had five days to load this steamer, arrangements had been made with the D. A. R. to run specials night and day which enabled them to load the boat in thirty hours.

A review of the apple shipments from Nova Scotia reveal tremendous strides. Within the past week 60,000 bbls. of apples have been shipped out which exceeds the whole season's output of a few years ago. This is only the commencement of what is to come. With the increasing young orchards coming into bearing, who, at present, would dare to predict the possibilities of the fertile fruit lands of the little strip of land, six to eight miles wide and only about sixty miles long, which is even at the present time famous the world over as the Annapolis Valley? It is thought that ere long the united fruit companies of Nova Scotia will be more deeply interested in the earnings of the steamers carrying the apples which even now is of considerable importance. The freight alone on the last little batch of apples sent from Halifax to South Africa amounted to nearly $13,000.00.

There is no reason why the fruit growers in Nova Scotia should not under the present system of co-operation, participate in the profitable transporting of their own production. —Ex.

Gastrio-Enteritis.

Editor The Maritime Farmer:—

I have a Plymouth Rock hen, just a year old, whose comb is quite dark. The hen has a good appetite and seems to be alright. I am afraid the dark comb might be caused by a disease and it might affect the other hens. The hen was alright until quite recently. Can you tell the cause and do you know the cure?—Fanny Tilly, Nfld.

You have no cause for alarm as your hen is not suffering from a contagious disease. The hen is simply out of condition and suffering from a derangement of the digestive tract, technically known as Gastro-enteritis, this affects all the digestive organs, including the liver. The cause of the trouble generally is a change of food, probably too many new green oats, etc. Put her in dry, comfortable quarters, dust her with insect powder or flour sulphur, feed sparingly of light food for a day or so, and give with drinking water muriatic acid, at the rate of one teaspoonful to one quart of water. Muriatic acid is the best known remedy for all disorders of the digestibe tract, and when followed up will cure "black head" in turkeys and fowls.—S. J.

Carload of P. E. I. Live Geese for the Boston Market.

Freight trains over the Intercolonial Railway from Point du Chene are carrying some pretty noisy freight these days. Live geese are being shipped from Prince Edward Island to the Boston market in great quantities. The birds are sent by steamer from Summerside in crates, and are loaded on freight cars at Point du Chene, each car being converted into a moving tenement capable of transporting 500 or 600 of the bipeds.

Pt. du Chene is a quiet enough place ordinarily but just now the silence is broken by a stupendous honking and hissing, and the din of a train load of live geese may be better imagined than described. And the noise continues all along the route.

The geese are being shipped to Bostoa consigned to a syndicate that is handling poultry on an extensive scale. The birds are not killed at once, but kept for a wnile and fattened until they are sufficiently succulent for the palates of American epicures. Raising geese is a profitable occupation with the prices now prevailing.

HORTICULTURE.

Growing Nursery Stock in a Cold Climate.

The question of nursery stock is one of much importance to the fruit grower. If he does not get the right kind of stock, no matter how closely he follows everything recommended, he will not have good success with his orchard.

It is sometimes unfortunately the case when a man orders trees, that the order is not filled by good stock and he is not able to get redress. There are several advantages, therefore, in ordering nursery stock for home nurseries. One advantage is that you can go and see the trees you are going to plant. If the trees are not satisfactory when you get them, you can return them and demand redress. This is a much more difficult process, when the man is a thousand miles away. If your trees prove to be diseased or are affected by insects it is also easier to get redress. These are some of the advantages of getting stock from a local nursery. On the other hand there are disadvantages.

The range of the native trees north to south has been determined by probably thousands of years of acclimitization. Our experiments at Ottawa for over twenty years show that native ornamental or forest trees from the south might fruit at Ottawa, but some years would be tender and kill back and not be vigorous and hardy. It has probably taken thousands of years to acclimatize those tender trees to their present northern limit. They might be hardy enough to produce seed, but the wood of individual trees keeps killing back. When we come to such apples as King and Baldwin, Rhode Island Greening, and some of the tender varieties, tender for certain parts of the province of New Brunswick, we find the same thing happening. These trees originated in a much milder climate than the province of New Brunswick. Their range has been determined largely by the relative degree of hardiness that is inherent in them, and it has been found by experience that if one introduces these trees and tries to grow them in northern nurseries, tries to grow Rhode Island Greening or King or Baldwin or any of these apples that require a long season's growth and are what we call tender, they prove a failure, they kill back, the bark splits. We cannot grow these trees in northern nurseries profitably. A tree that is tender will not be made hardier by growing it in cold districts.

COMPARATIVE HARDINESS.

You may ask: Will the average apple originated, say, in the province of New Brunswick be necessarily hardier than the apple which is originated, say, in the State of New York or Rhode Island? No, it might not be hardier if originated there. If I sow the seed of the Wealthy apple in the province of New Brunswick, the seedling of that apple is not necessarily hardy. Some may be hardy and some may be tender, and it will require a great number of years before one will find out which seedlings are going to be hardy in New Brunswick. When one has a seedling, say, the Merrit, which originated in the province of New Brunswick, an apple tree that has been able to withstand the cold climate year after year, you cannot say that variety is hardy because it is able to withstand the cold climate. Seedlings from a hardy tree, however, are much more likely to be hardy than seedlings from a tender tree. We have found that in our experience.

Which, you may ask, is the better, Northern or United States grown stock, local grown New Brunswick stock or stock grown, say, in the province of Ontario? Which is the better stock for us to use? Are there great advantages in growing home-grown stock, or are there not such great advantages?

CLIMATIC DIFFERENCES

In the warmer parts of Canada and the United States they have a much longer growing season than you have here. The result is that they can plant nursery stock on much richer soil than you can and have the trees ripen thoroughly. If you plant nursery stock in Northern New Brunssoil, your trees will not be properly ripened and will be almost certain to winter kill.

There is danger in getting nursery stock, even from the southern district, in getting it properly ripened because trees are dug which are not thoroughly ripened. For instance it has been the practice—I won't say it is the practice now—to dig trees in large nurseries while the leaves are still green and strip the leaves off so as to give the tree the appearance of being thoroughly ripened. You can easily see that if such trees are planted in another district they are liable to be too tender for the first winter. So that you see from my standpoint there is not sufficient evidence in regard to the quality of the trees from the southern nurseries and the northern nurseries to warrant the statement which has been made that northern stock is the best stock. For instance, I believe you can get hardy stock ripened in southern nurseries and secure just as good results from them as from stock from the home nursery.

DISADVANTAGES.

Some of the disadvantages of growing nursery stock at home and in colder districts include the following: There is a temptation at home to grow nursery stock in rather rich soil in order to get a strong growth and a strong tree. If you plant your trees on a clay soil or a heavy soil there will come certain years when the fall is favorable to late growth when you will lose a large proportion of fine, hardy varieties, such as McIntosh Red and Fameuse. So if one wants to have home-grown stock one must grow it on rich soil which is not too rich. If your soil is well drained and warm your stock should be thoroughly ripened before the winter sets in.

Another disadvantage of growing trees at home is that one loses one year very often in the growth of trees if one wants to get good stock, because no matter whether you grow your trees on light soil or heavy soil we have found in some winters in a cold climate the trees become what is known as "black-hearted." This is due to the fact that the trees have made too late a growth, notwithstanding the greatest care. It may also be that trees have ripened their wood all right and a very severe winter follows while the trees are quite young, and the result is the pith and wood of the trees are damaged, but the cambium being alive the tree goes on growing next year, and unless one treats the tree the way I have described one is liable to have black-hearted trees. While black-heart may not be a very serious injury to a tree in its early history, just as soon as they begin to lose the branches disease will begin to work on the trees, and eventually the tree will decay and break down. After a very severe winter, we have found that black-heart occurs in trees set out in the orchard three or four years. As a rule, I think I am safe in saying it occurs in the nursery. We want to avoid this black heart in trees.—W. T. Macoun, Dominion Horticulturist, Ottawa, before the N. B. Fruit Growers Association in 1910.

He Bought Her a 1900 Washer

ONE OF OUR READERS TELLS HOW HER HUSBAND LEARNED

What Washday Means to a Woman

DEAR EDITOR:--Most men have no realization of what "wash-day" means to a woman. My husband is one of the best men that ever lived, but he laughed when I asked him one day to get me a 1900 Gravity Washer. I told him it would wash a tubful of clothes in six minutes. "Why, wife," said he, "a washing machine is a luxury. And besides, there's no better exercise than rubbing clothes on a washboard. It's good for the back. I think we had better wait 'til we get the farm paid for before fooling away money on such new-fangled things as washing machines."

John's "Busy Day"

That settled it. I gave up the idea and kept right on washing in the same old way. I confess that I felt hurt, but I knew John had no notion how hard it was to do the washing for a family of five—three of them little tots. I am not very strong, and the washing, with all my other work, finally got the better of me. I had quite a sick spell, and after things had gone at sixes and sevens for nearly two weeks, I suggested to John that he had better do the washing. We couldn't hire a girl for love or money, and the situation was desperate.

So one morning he started it. My, what a commotion there was in the kitchen! From my bedroom I occasionally caught glimpses of poor John struggling with that mountain of dirty clothes.

If ever a man had all the "exercise" he wanted, my husband was that man! Couldn't help feeling sorry for him, and yet it made me laugh, for I remembered how he made fun of me when I hinted so strongly for a 1900 Gravity Washer. When he finally got the clothes done and on the line, he was just about "all in."

That evening John came to my room, and said kind of sheepishly—"What's the name of the firm that makes those washers you were telling me about?" I looked up their advertisement and found the following address:

G. X. MORRIS Manager
The 1900 Washer Co.,
357 Yonge St., Toronto, Can.

That's all he said, but he lost no time in sending for their Free Washer Book. The book came in due time and with it an offer to send the 1900 Gravity Washer on thirty days' free trial. My husband jumped at the chance to try the Washer without having to spend a cent. "We'll have four weeks' use of the Washer anyway, even if we don't decide to keep it," he said! So he told the Company to send on the Washer.

It was sent promptly, all charges paid, and the 1900 Washer Company offered to let us pay for it in little easy payments. The next week I felt well enough to use it. It is the nicest Washer I ever saw, and it almost runs itself. Takes only six minutes to wash a tubful, and the garments come out spotlessly clean.

We were all delighted with the Washer, and wrote to the Company that we would keep it and accept their easy payment terms of 50 cents a week. We paid for it without ever missing the money and wouldn't part with the Washer for five times its cost if we couldn't get another just like it.

If women knew what a wonderful help the 1900 Gravity Washer is, not one would be without it. It saves work and worry and doctor's bills. Takes away all the dread of wash-day. I feel like a different woman since I have quit the use of the washboard. And if any woman's husband objects to buying one of these labor-saving machines, take a hint from my experience. Let the man do just one big washing by hand-rubbing on the old-fashioned washboard, and he will be only too glad to get you a 1900 Gravity Washer.

Anybody can get one on free trial, by first writing for the Washer Book.

Excuse me for writing such a long letter, but I hope, Mr. Editor, you will print it for the benefit of the women readers of your valuable paper.

Sincerely yours, MRS. J. H. SMITH.

Practical Apple Growing.

There are many factors to be taken into account in the consideration of the best varieties, or rather the best paying varieties of apples, that one need scarcely look for the same answer from any two growers.

Some of these factors that the planter must take into his estimates are:—

1. Rapidity and strength of growth as well as hardiness and vigor;
2. Early bearing habits;
3. Heavy bearing or shy bearing varieties;
4. Amount of feed necessary for good annual yields. Some varieties have to be fed much more heavily than others to get satisfactory crops;
5. Ease in producing fruit. Some trees from the nature of their growth are much easier to prune, spray, cultivate and pick than others;
6. Keeping and shipping qualities of the fruit;
7. Resistance to disease, rough handling, etc.;
8. Market demand, hence average prices;
9. A good reputation, obtained by a good average over many years.

The perfect apple, which by the way, has not yet been found, would excel in all these points. So when we speak of the best varieties we choose those which combine as many of these excellencies as possible, remembering, of course, that all these are of equal importance.

To illustrate my meaning:—The Ribston is a continual bearer and bears early in life quite heavily. The fruit carries well, will stand rough handling but the apple does not grow free from disease and it is not a high-priced apple. It is, however, considered to be one of the best paying varieties here in Nova Scotia.

The Gravenstein, also one of the best varieties does not carry well, is subject to fungus diseases, but on the other hand it bears well, and is very desirable in the market. The Cox's Orange is one of the best flavored apples grown and until recently, the highest priced apple in the English market. Its draw-backs are that the tree is a shy bearer, requires to be well fertilized and has a delicate growth.

WHEN A TREE PAYS.

Among the old varieties, in my opinion, and I find it is held by many other orchardists, we must place the King, which has to be well fed, and the old Baldwin as the best paying varieties, after they come into bearing. This reluctance on their part to get to work constitutes their great drawback. By grafting the former onto the stock of a good bearer one will often get the tree into abundant bearing early. These two apples have been bringing top prices for some time.

The age at which a tree will come into profitable bearing depends also largely on the care it has received. Since transplanting, Northern Spies, by being well cared for, and pruned very little during their growing period, have come into bearing profitably at eight years, although fifteen years is the time generally given them. I would say that the ages that five or six of the best varieties take to come into profitable fruiting are as follows: Baldwin, 10 years; Spy, 12 years; Ribston, 6 years; King, 12 years; Gravenstein, 5 to 7 years; Wagener, Cox's Orange, etc. 5 years.

Home Dyeing has no terrors for me - It's simply my delight

Even Professional Dyers can't equal my Perfect Results That's because I use

DY-O-LA

ONE DYE FOR ALL KINDS OF GOODS

It's the CLEANEST, SIMPLEST, and BEST HOME DYE, one can buy--Why you don't even have to know what KIND of Cloth your Goods are made of.--So Mistakes are Impossible.

Replace Your Out-of-doors Closet

WITH A TWEED SANITARY CLOSET and get rid of the thousand and one dangers and troubles of the old fashioned out-house.

The "Tweed" Closet is easily installed indoors and requires no sewer, no plumbing and no flushing system.

"TWEED" CLOSET
Sanitary and Odorless

can be placed in the cellar or in any suitable room in the house.

The use of the "Tweed" Chemical—a liquid disinfectant and deordorizer—keeps the closet absolutely odorless. For ventilation the "Tweed" is connected by a pipe to a chimney hole or stove pipe.

The "Tweed" Closet was awarded a Diploma at Ottawa Exhibition 1911.

Send for illustrated price list, mailed on request.

STEEL TROUGH & MACHINE CO., Ltd.
9 James Street, - TWEED, Ont.

To The Public

We beg to announce that we have purchased the good will and interest of the EMPIRE LINIMENT CO. Ltd. and will supply the trade for this excellent Liniment from our factory at Middleton, where all orders should be addressed.

C. GATES SON & CO.

What Says C. H. Purdy, of Bear River, Warden of Digby County, N. S.?

"I was a complete cripple with Rheumatism saw EMPIRE LINIMENT advertised and tried it, after every known Liniment and Rheumatic cure. Here I am to-day, sound and well, after using only a few bottles. I recommend it to all sufferers. Don't be without it.

C. H. PURDY.

Taking into consideration all the desirable points. I have not much hesitation in claiming for the Baldwin the highest place. The tree is easily pruned, sprayed and cared for. It has a reasonably sound and vigorous growth, is a good bearer, has a good reputation on the market and is a fine carrier.

WHAT IS A TREE WORTH?

In my own experience the Baldwin has given the best ten year results. The question of what a tree will do, must depend largely on the age bearing surface of the tree. I have Baldwins that averaged in the last decade, six barrels to the tree, and others that would only average two, and still be full. A 25 year old tree should give an average yearly crop of four barrels, and this is a good record. Of the four barrels per tree, three at least should pack which would give $6.75 per tree per year, counting them by my average, which is $2.25 per packed barrel. I consider this, though, to be above the average, but we are speaking now of the best paying varieties.

The King on its own stock is a shy bearer but when it is grafted on the Talman Sweet which is a prolific species, it becomes a very good bearer. I have two trees so grafted which average me three barrels to the tree.

From practical experience I find this one of the hardest questions to answer, in the whole range of problems of commercial orcharding. During the last year, I asked twenty different men, men who should know most about it, and I got a list of some fifty varieties. Almost every orchardist has some pet varieties and we all differ. Last spring I planted almost 1,000 trees and these were chiefly Stark and Baldwin for standards and Wagener and Cox's Orange for fillers. These early bearing ones are planted in order to make the land produce something soon.

In planting out a wholly new orchard I would select a range of varieties covering the whole year from September to May, so as to have picking, packing, etc., extend over as long a period as possible and so avoid a congestion of labor in any one period. In this part of Canada I would plant the following varieties: for September, Gravenstein, Duchess and Wealthy; for October, Ribston, King and Blenheim Orange; for November to March, the Baldwin, Wagener, Cox's Orange, Stark and McIntosh Red. I would not plant out more than 8 varieties, for a commercial orchard, for the principal reason that a few sorts will sell better, be less trouble to pack, can be sold in larger quantities at one time, and will attract buyers more readily than small lots of many varieties.—R. J. Messenger, Bridgetown, N. S.

Reward of Extra Care.

In selling fruits and vegetables the grower should gather the best only, put it up in attractive packages, have his name and address plainly written on the package, and seek to build up a trade thereby. The consumer should be more than satisfied; he should be anxious to get more, even if a better price be asked.

It is possible to establish a trade in such products and even eliminate the dealer. Our own experience has shown that it pays to put on an extra product and to take extra pains to make it attractive. No one is deceived in poor packing but yourself, because you expect more than you get by such packing. The consumer is exacting and discriminating, and there is no good business reason for expecting that anything will be gained in the long run by sending out poor stuff, even fair stuff, in faulty packages.

Try an extra product, put up in excellent shape, and then watch the results. If it does not pay you will not lose anything. But it will pay.

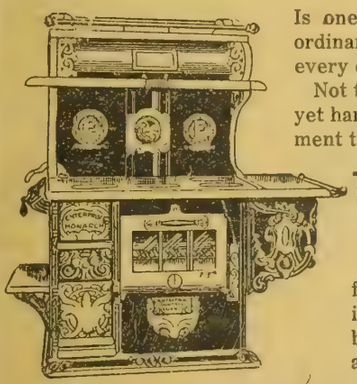
Your Money Back IF

The "if" is big because few want it. But this frank, fair offer shows your dealers faith that the rare richness of this tea's flavor will delight you:—

All you have to do if you do not like the flavor—yes more than like it—is to return the broken package and receive your money back.

35c., 40c., and 50c., per lb.

A Reasonable Range



Is one that is not too expensive for the ordinary family to buy, but good value for every dollar invested in it.

Not too ornate and hard to keep clean, yet handsome in appearance and an ornament to any kitchen.

THE ENTERPRISE MONARCH STEEL RANGE

fills the bill in this regard. That is why it is so popular and has been installed in so many well appointed homes.

It is—MODERATE IN PRICE, EASY AND ECONOMICAL TO OPERATE, A GOOD BAKER,
And—A CONSTANT SOURCE OF COMFORT IN ANY HOME

—Sold by all the leading stove dealers—

If your dealer does not handle it write direct for circular and full information.

DAIRYING.

More Profit From the Dairy Cow.

There has been in years past and still is, although the number is decreasing from year to year as the dairymen come to learn more about the business, a large number of cows that do not pay their keep. They do not pay for the feed they eat, to say nothing of the labor required to feed and milk them twice a day.

Most dairy farmers are in the business for the dollars there are in it. They are not keeping cows for sentimental reasons and running a charitable institution for the aid of cows not capable of taking care of themselves. They do not pretend to keep cows for this reason, yet this is precisely what many are doing—running a charitable institution unwittingly. If the cow is not paying a profit at pail, she may be made to pay a profit as food for human consumption and this is what should be done with her. If she is fit only for beef, convert her into beef and do not try to fool yourself into thinking that she is a dairy cow.

Which class she belongs to cannot be told at a casual glance. She must be tried by scales and butter test in order to be at all sure. Some very intelligent dairymen have been wonderfully surprised at the difference between their own estimate with the eye and the showing of an actual and thorough test. There are two ways to increase the profit from the cow. One is to improve the cow and the method of caring for her, and the other is to decrease the cost of keeping her. A combination of these two methods usually give most satisfactory results.

Not all cows are in themselves responsible for poor records. The president of the Vermont Cow Testing Association remarked at the annual meeting that it was as much a man test as it was a cow test. My own actual experience showed that a herd of cows kept on the same farm for several years increased their yearly average of butter-fat at the creamery from 175 pounds a year to 316 pounds a year by a change of owners.

A cow to produce butter-fat must have more than just enough feed to keep up her physical economy, else there will be no surplus with which she can manufacture milk, for a cow is a factory, and manufactures from the food given her the butter-fat that you desire through the intricate processes of her physical organization. If the material furnished her is poor or not sufficient for the purpose, or her surroundings are such that she has to use a large part of it to sustain life and bodily heat, she will not deliver to her owner a very large quantity of her finished product, but in such a case she herself is not lacking. She cannot make bricks without straw.

The testing associations show the man where his trouble is and the cow soon proves her worth. Think you Belle De Kol would have beaten the world on the feed given thousands of good cows throughout the country? Look at the record of her feed, at her size, and observe that she was a cow of wonderful capacity and that she was furnished with all the perfectly adaptable material that she could handle with which to manufacture her product. Here then is one method by which more profit may be made from the dairy cow. A man may study this out for himself with the aid of ration tables, experiments with his individual animals and good judgment, but he will arrive at results quicker if he has the aid of experienced assistance.

The cow that does not convert her food into the desired product should be exchanged for one that does. The scales and the Babcock test will determine this, and here again a man may study things out for himself or have trained assistance. The pioneers in all this work, worked out their problems alone, but the farmer today may take a shorter route and arrive more quickly by taking advantage of the services of those who have studied the matter before him. The average farmer's time is worth more to him than the small amount of money that it costs to belong to a cow testing association.

Where there is no association to which he can belong the outfit with which to do the work himself is not expensive, or he may get pretty accurate results by having his milk tested at the local creamery at stated intervals. Once a month does very well and he can weigh and estimate his feeds himself, weed out the poorest cows and buy or breed better ones. Better half the number of good cows, well fed and cared for, than the whole herd with poor cows, poor food and poor care. Better no cows at all for the poor herd pootly cared for will run its owner behind. The obvious way to produce more profit here is to improve the cows.

Still another way is to lessen the cost of the food consumed, not by reducing the quantity or the quality, but by producing it cheaply. Hitherto cows have consumed a good deal of timothy hay and grass. This costs as much or more to produce as any feed possible and contains the least material for buttermaking. Raise clover hay, peas and oats, any of the legumes that do best on your soil. They furnish more protein and leave the soil better that they found it. Build a silo and make ensilage of well eared corn. Such silage as this, with clover or pea hay, will furnish the needed material with the addition of a portion of cottonseed meal and barn and will be less expensive. Keep up the milk flow with green feed and improve the pastures by sowing to clover seed after going over them with a harrow. Every dollar decrease in the cost of food means an added dollar in the profit of the cow. The business of dairying should be studied from every point as thoroughly as any other manufacturer studies the profit and loss columns of his work. When this is done, dairying will prove a more profitable occupation that it has been in the past.—Kimball's Dairy Farm.

A Practical Minister.

Ministers as a rule devote their time wholly to affairs spiritual, having little time and possibly little inclination to give to the physical welfare of their constituents. We have learned of one minister, however, who is different than most of them. From a clipping taken from an Illinois paper it is evident that one pastor, at least, takes as much pleasure in interesting himself in the daily labors of his farmer friends as he does in administering to their spiritual welfare. Under the heading "Are You Keeping Cows or Are They Keeping You," the item reads:

"Neither the fullness of your milk pail nor the size of your cream check can answer this question. A rough guess must always come short of satisfaction. There are ways of knowing absolutely which cow helps to feed you and which one makes you feed her. The scales tell how much milk Bossy gives per year, and the Babcock test tells how much butter fat it contains.

"If you would like milk tested I will furnish you bottles, preservatives and directions, and test the milk for you at ten cents per cow. First come, first served."

To Prevent Chapped Skin

—use warm water and Baby's Own Soap.

The warm water opens the pores of the skin and the minute particles of pure refined vegetable oils which form the creamy, fragrant lather of Baby's Own Soap are absorbed into the skin, keeping it soft, healthy, and preventing cracks and chaps.

A perfect rinsing, then smart rubbing when drying guarantees a fine smooth skin in any weather.

BABY'S OWN SOAP

Best for Baby Best for You

2-12

Canada's Standard toilet and nursery soap for over 30 years.

ALBERT SOAPS, LIMITED, - MONTREAL.

The Man and the Cow.

It was a bit of good sound thinking that Dean E. A. Burnett of the Nebraska Agricultural College used in his address before the Nebraska Dairymen's Association. In the course of his remarks, he said:

"Two things are necessary in order that the dairy business may prosper and those two things spelled out are the cow and the man.

"Fortunately you cannot just go out and pick up either by the carload. You have to breed both of them because a man is not necessarily a dairy animals because she gives milks cows and a cow is not necessarily a dairy animals becadse she gipes milk. In order to have a successful dairy business you must have a man who is educated to the business, who knows the business and is willing to learn the business, and you must have the cow that can deliver the goods. It takes years of training to make the best of dairy men and it takes years of breeding and selection to develop the best cow.

"When you find a man who has behind him these years of training, there is no trouble about his making money in the business and there is no trouble about his finding a place to work under profitable conditions if he wants to sell his services to some other man. When you find a cow that is capable of producing a large yield of milk or of butter, then she is worth more money to the dairyman than the average man believes."

Farther along in his address the dean spoke of the immense value it would be to the dairy farmer to have grass the year round and said:

"You know when you turn your cows out in the spring on grass that they go up in their milk production.

"What is it that makes that increase in the production? It is the succulent, easily digested feed. If we can have grass all the year round, why not have it and we can have it by means of the silo."

Neutralizing Acid in Overripe Cream.

It is customary in some creameries known as "Centralizers," to neutralize the excessive acid which is found in cream delivered but once or twice a week during hot weather, then pasteurize and ripen with a pure culture or "starter". In order to obtain some data on the effects of various neutralizers, five experiments were conducted at the O. A. C. Dairy School, in August and September, testing the effects of Baking Soda, Washing Soda, Lime Water and Milk-lime, when added to sour cream before pasteurizing.

COMMENTS ON RESULTS.

1. The addition of the "neutralizer" had the effect of lowering the percentage of acidity in the cream to a marked degree. Pasteurization of the cream had a further effect of reducing the acidity, probably due to a more perfect chemical action as a result af the process of heating, although pasteurization alone reduces the acidity of cream to a slight extent. This latter effect is probably caused by a freeing of some of the natural lime salts of milk by the action of heat. The acidity did not seem to develop afterwards on the neutralized cream to the same extent as in the normal lots pasteurized and ripened with a similar percentage of culture.

2. In all cases, except the one where washing soda was used, the cream churned in less time after partial neutralization of the acid before pasteurizing. To some extent this may have been due to less weight of cream in the churn for these lots. There was also a tendency for less loss of fat in the buttermilk from these lots, as compared with the normal lots.

3. There was also a difference in the percentage of moisture and salt in the finished butter from the various lots.

4. The "overrun" was less in the lots where the cream was neutralized, as compared with the "overrun" from similar lots not neutralized. In the four tests which are compatable, the average "overrun" in the normal lots was 16.9 per cent., while the others averaged 13.2 per cent. The tendency was for a lower yield of butter in the lots where the cream was neutralized before pasteurizing.

5. There was little or no difference in the average scores for flavor, or in the total scores of the four lots.

6. The results by neutralizing with lime water before and after pasteurization of the cream were not decisive. More experiments on all these points are needed before drawing conclusions.—Prof. H. H. Dean, O. A. C., Guelph.

Better Butter And Better Prices

These are the two big reasons why you should use Windsor Dairy Salt.

If you make your living out of the butter you sell, then anything that will make the butter better will make more money for you.

WINDSOR DAIRY SALT

has proved its quality and superiority in thousands of dairies and in hundreds of contests.

Successful creamery men have used and are still using Windsor Dairy Salt—because it gives them the best results always.

Are YOU using it? 71D

FORMER ARMY CHAPLAIN PRAISES OCEAN LIMITED

South African Veteran Declares it is the Best on the Continent.

Moncton, N. B. Oct. 23.

Rev. W. G. Lane, one of the Chaplains to the first Canadian contingent to South Africa, and now pastor of the Wesley Memorial church in this city, has just returned after an extended trip to the western States, and has this to say in comparison of American and Canadian railroads.

"The "Ocean Limited" was by far the best equipped and most comfortable train we came across in our travels and we travelled on the crack trains of some of the biggest of the American railways. We came across nothing that could beat, or even equal, either in equipment or comfortable riding qualities the famous express of the Intercolonial. People who return from the States and talk of the superiority of the American roads over that of the Canadian Government either do not know what they are talking about or else are deliberately seeking to belittle the railroads of Canada."

The Gases of Emmental Cheese.

Why holes in cheese? What makes them? and what do they contain? Exhaustive research alone can solve this tangle, but it is believed that the investigation reported in Bureau of Animal Industry Bulletin No. 151, bearing the title at the head of this article has provided both a clearer definition of the problem and a sound basis of fact.

The so-called "eyes" in Swiss cheese are, as is well known, its most prominent characteristic, and its commercial value is largely dependent upon the proper size and spacing of these eyes, says a press bulletin from the Department of Agriculture. While the hole is not the whole of it, much depreciation in value of this popular variety of cheese, in both domestic and foreign kinds, is known to exist because of defects in eye formation. Hence to the biological chemist their formation is a facinating subject, and to the cheesemaker a matter of great importance. In certain districts the dealers rely almost entirely upon these features, and, shortly after the eyes have reached their proper development, relieve the maker of further care. Therefore the American makers of Swiss cheese are unable to attend to their cheeses in that mellowed old age upon which so much of the fine flavor of a true Emmental cheese depends. Although this quick marketing may be deprecated it nevertheless raises the relative importance and adds significance to whatever knowledge can be gained concerning the process of eye formation.

The experimental work described in this bulletin which can be secured by those interested from the Secretary of Agriculture, concerns the chemical contents of these eyes, the gases of which are immediately concerned in the process of their formation, and offers the following conclusions:

The gases of normal "eyes" in Emmental cheese are exclusively carbon dioxide and nitrogen, and of these only the carbon dioxide is of significance.

The nitrogen accompanying the carbon dioxide in normal eyes is that of air originally occluded in the curd at the time of manufacture.

There sometimes occurs during the initial fermentatian an evolutian of gas characterized by the presence of hydrogen. This is believed to be due to the gaseous fermentation of sugar.

The hydrogen from such an initial fermentation may sometimes linger to contaminate the gas of normal eyes.

The two fermentations are distinct and are characterized by their gaseous products. The one is detrimental, the other that demand of a good Emmental cheese.

High oxygen-absorbing power combined with low permeability of the cheese to air render the interior thoroughly anaerobic, and consequently favorable to the growth of anaerobic bacteria.

A comparison between the amount of carbon dioxide evolved and the total volatile fatty acids shows that the activity of the propionic bacteria of Von Freudenreich and Jensen is not sufficient to account for all the carbon dioxide found.

It was found that cheese was capable of retaining a very large mount of carbon dioxide.

The possibility is suggested that there are two phases in the formation of normal eyes, a saturation of the body with carbon dioxide, and an inflation of eyes; and the bearing of this hypothesis on the production of gas by a specific cause is discussed.

"Eastlake" Steel Shingles

will save you money

Just ask yourself this question Mr. Farmer, "Is my barn roof lightning proof—is it fireproof?

It's not a cheerful sight to see your barn—full to overflowing with the season's crop—wiped out by lightning or a spark from the threshing engine.

All because of faulty roofing.

A fireproof roof is the only **sure** protection for your crops, your livestock and implements.

"Eastlake" Steel Shingles are absolutely **lightning-proof, fire-proof, storm-proof and vermin-proof**—the best and safest roofing for all buildings.

"Eastlake" Metallic Shingles are made of the finest galvanized steel—are easiest and quickest to lay—save labor and expense.

"Eastlake" Shingles cost less than a wooden roof equipped with lightning rods.

"Eastlake" Shingles make the best roofing for you, Mr. Farmer.

Roofs covered with **"Eastlakes"** a quarter of a century ago are in perfect condition to-day. This is the best guarantee for you.

Send for our illustrated booklet, **"Eastlake Metallic Shingles."** Write to-day—just your name and address.

We also manufacture Corrugated Iron, House and Barn Siding, Metallic Ceilings, Cornices, Eavetrough, Conductor Pipe, Ventilators, etc.

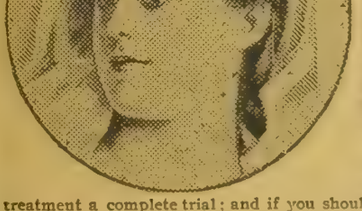
FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.



I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Falling** of the Womb, Profuse, Scanty or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** [illegible]

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to [illegible] the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with this wonderful remedy. It cures **all, old or young.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhoea, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes them well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the book. Write to-day, as you may not see this offer again. Address:

LIVE STOCK.

Line Breeding as Applied to Sheep.

(A paper read before the South African Association for the Advancement of Science, Port Elizabeth, by Mr. C. Mallinson, principal sheep and wool expert of the South African Department of Agriculture.)

It is well that we should at the outset carefully define what we mean by the term "line-breeding" as opposed to "in-breeding"; the former is breeding from the same blood or within the same family, by selection (but not from such close affinities as parent and offspring and brother and sister,) whilst the latter is the ill-considered mating of the closest relations within the one family. Even these definitions are not quite satisfactory, for the point where line-breeding ceases and in-breeding begins is difficult to determine; in fact, the way in which that point can be determined is uncertain, the only factor available in such an inquiry being the result obtained.

Notwithstanding this difficulty, it is beginning to be recognized that the grading-up of flocks can be successfully accomplished only by line-breeding, and the large number of breeders who have refused to adopt this method have, in general, overestimated the dangers of such a system, and failed to grasp the immense benefit to be derived from its adoption. Rams are constantly being introduced into the flock in the belief that the introduction of new blood will add to its strength and vigour; yet there is evidence that some of the most valuable flocks in Australia belong to men who have never been prominent buyers of rams. One might go further, and say that there are flocks in Australia —and flocks of the highest class—which have received no introduction of new blood for the last sixty years. Even among the more modern flocks violent outcrosses are avoided by those sheepmen whose studs have passed through the initial stages and reached any degree of uniformity.

In-breeding in itself should not, it may be argued, effect the constitutions of the animals if it be not carried too far, and there should be no reason why one fault should be given prominence over another. But the difficulty is to determine how far in-breeding may be carried on without going too far. What in-breeding actually does is to enlarge all the characteristics of the animals bred, and to give prominence to the merits and faults of the particular family used whether those merits or faults are those of constitution or anything else but its results are so uncertain that this system is to be avoided; for selection is impossible, owing to the small number of units in the family available for selection, that is to say, circumstances prevent the culling of individuals with undesirable qualities stamped upon them, and thus such breeding cannot do anything but deteriorate the flock.

Line-breeding, on the other hand, is so remote and complex, owing to the great number of units in a flock, that selection can be made so as to counteract the growth of particular faults and to encourage desirable qualities. Independently of the selection difficulty, however, it may be stated that breeding between two descendants of a near common ancestor is intensified in-breeding; it is in-breeding carried to its furthest limit; whereas in-breeding between descendants of a remote common ancestor is modified in-breeding, or, as it is called to-day, line-breeding. It is remote, and therefore the characterizing effects of the system are less prominent.

Selection is the essential, for it is by this means that the advantage is to be reaped. No first-class flock ever existed that was not of a type, and the type cannot be fixed by any other method than selection. Yet mere selection in a flock into which fresh blood from strange families is introduced from year to year cannot be expected to fix any type. Of course, it must be borne in mind that while external faults are visible to the eye, and may thus be directly guarded against by selection, there are other characteristics such as a weakly constitution or a tendency to unthriftiness which are not so obvious, though these, too, will be eradicated by judicious annual classing.

It is not my intention in any way to disparage the usefulness of an introduction of new blood in certain cases. There are cases in which such an introduction might be necessary to correct undesirable characteristics or failings, or to give prominence to some desirable quality, but—and this is an important thing to remember—the improvement must be made by using a ram of the same breed and the same family as the flock it is desired to improve. At the same time the proper method for the established breeder is to reject fearlessly all undesirable sheep. In the same way as drastic treatment is necessary when pruning a tree, so thorough classing is good for the flock. Let no unworthy animal be spared. The mere moral effect of having a few poor animals in the flock is bad, for it constantly lowers the standard of the breeder's excellence. Weed out the flock every year on this account, but even more because a bad tree will inevitably yield evil fruit. Above all things the farmer should learn to shun the delicate, unthrifty and weak in constitution. No animal, however fine in appearance, if of feeble constitution, can be expected to breed well, least of all can prepotency be looked for in a sheep of delicate health.

The theory that "the methods my father and grandfather followed are good enough for me," is one of the worst ever formulated. It generally indicates that the inherited method is a foolish and careless one. Traditions of this sort are usually kept by those whose fences are rotten, whose weeds are uncut, whose sheep are half-starved and diseased. If it were otherwise the son and grandson would have been educated up to a progressive spirit, for he who is first is by his very priority of effort inspired to maintain his pre-eminence. What is necessary for us all is to learn what the scientist has to teach, and then apply it in a practical common-sense way, and therefore the sooner all the sheep farmers in this country study scientific methods of breeding, and apply them to their flocks the sooner will South Africa occupy her proper place amongst the pastoral countries of the world.—Pastoralists Review.

Sows Eating Pigs.

I have a very fine Yorkshire sow three years old. She always has two litters of seven pigs each, every year. She is a good, careful, old mother with her young. At time of farrowing the sow is nervous and easily disturbed, and should have perfect quiet. I always watch the sow carefully, so that she is never alone with her young at that time. She is a very ravenous creature, and I would not risk the chance for fear she would destroy her young. Last March I stayed with her from eleven o'clock at night till seven the next morning, and it was a very cold night; but I had eleven fine little pigs to reward me for my trouble.

INTERNATIONAL STOCK FOOD
Makes Cows Give More Rich Milk.

International Stock Food conquered England, just as it conquered Canada and the United States, by proving to the Dairy Experts that it is the greatest milk producer and health restorer in the world.

The test was made on three cows from the dairy herd of S. W. Hackney, Esq., Leeds, England, Chairman of the Yorkshire Federation of Dairy Farmers.

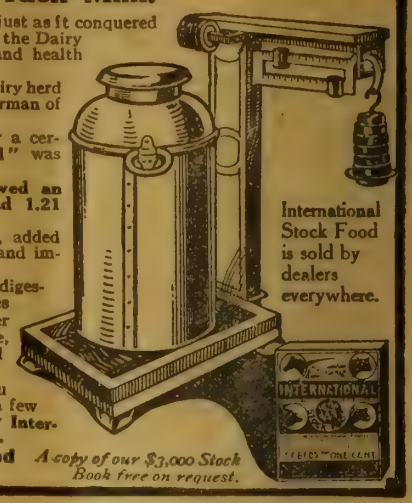
Quantity and quality of milk was tested for a certain time—then "International Stock Food" was added to the regular feed.

INTERNATIONAL STOCK FOOD showed an Increase in Milk of 14.2 pints daily, and 1.21 pounds of butter daily.

This proves that International Stock Food, added to the regular feed will increase the quantity and improve the quality of milk from every cow.

It shows that International Stock Food aids digestion and keep cows in better condition. It proves that International Stock Food is a money-maker for the farmer—that every farmer who owns one, or a hundred, cows should feed International Stock Food every day.

Make the test yourself—weigh the milk you are getting now—then feed International for a few weeks, and weigh again. Then you'll see how International Stock Food will make money for you.



International Stock Food is sold by dealers everywhere.

This Wife and Mother

Wishes to tell you FREE How She Stopped Her Husband's Drinking

By all Means Write to Her and Learn how She did it.

For over 20 years James Anderson of 193 Spadina Ave., P.B. Toronto, Canada, was a very hard drinker. His case seemed a hopeless one, but ten years ago his wife in their own little home, gave him a simple remedy which much to her delight stopped his drinking entirely.

To make sure that the remedy was responsible for this happy result she also tried it on her brother and several of her neighbors. It was successful in every case. None of them has touched a drop of intoxicating liquor since.

She now wishes everyone who has drunkenness in their homes to try this simple remedy for she feels sure that it will do as much for others as it has for her. It can be given secretly if desired, and without cost she will gladly and willingly tell you what it is. All you have to do is write her a letter asking her how she cured her husband of drinking and she will reply by return mail in a sealed envelope. As she has nothing to sell do not send her money. Simply send a letter with all confidence to Mrs. Margaret Anderson at the address given above, taking care to write your name and full address plainly. *(We earnestly advise every one of our readers who wishes to cure a dear one of drunkenness to write to this lady today. Her offer is a sincere one.)*

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous **Free Trial Treatment** of my well-known, reliable **Chronicure**, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. **Chronicure** succeeds where all else fails. **Chronicure cleanses the blood** and **removes the cause.** Also for a weakened, run-down condition of the system, you will find **Chronicure** a most satisfactory **general tonic** that makes you feel that life is worth living. Please tell your friends of this liberal offer, and **send today** for large free package, to **MRS. M. SUMMERS, Box E. 309—Windsor, Ont.**

I always remove the little ones as fast as they come and place them in a box lined with old sacks and covered with the same (not air tight, but to keep the cold air from striking the little pigs, for if the cold, frosty air strikes them they will, die of pneumonia in an hour's time. This sow I have usually gets up when six little pigs have come, and will come to the trough. I always have ready a warm drink of scalded bran, with a little stock food in it. This satisfies her and she lays down again till she finishes. Then when she is through and gets up, I have two pails more of warm bran or middlings ready for her, and I give her all she will eat; then she is ready to lay down and is sure to rest for at least two hours or more. I place the little ones around her carefully and watch till they have all started to suck, then I leave them. In about two hours I come back and I find the little ones have tired themselves out nursing and are now sleeping in a bunch. The mother is now ready to get up for some more feed, which might consist of potatoes with middlings or mashed oats. I always give a level tablespoon of stock food twice a day in the drink food.

This sow has produced some very nice pigs. Some of her 1911 spring litter, when dressed last December, tipped the scales at three gundred. I like the Yorkshire pig. They are hardy and rugged, good feeders, and always healthy. The Chester White is more docile, but inclined to be delicate. I like the Yorkshire and Chester cross.

Now, in my opinion, it is not a habit, the sow eating her young, but due to the way she is managed. I don't think any sow will eat her young if she can get enough of any other kind of food to eat. The sow is naturally ravenous and hungry when she gets up, and must eat something, therefore, leave enough of food where she can get it. Have a look at her frequently for the first 24 hours and keep her very quiet for the first three days. I think this will insure good success. If you consider this worth publishing, it might be of some benefit to some beginner. In some instances the beginner has to make so many tries to find out which is qest to do, that he becomes discouraged.—W. F. Johnson, in Canadian Farm.

Advice on Crippled Pigs.

I would like to know if you could tell me what is the matter with my pigs. I have ten of them; they are about four months old. I am feeding them with oat chop, a little peameal and turnips, and I make it warm for them. They are in a fairly dry, warm place; they eat all right, but about a week ago one of them started to be bad on its legs, and now it can hardly walk. Is it rheumatism, and is it contagious? I shall be pleased if you could let me know what to do for them.

Ans.—This form of crippling in pigs is due to a deranged condition of the digestive system. It is usually caused by feeding too much heavy, rich food and lack of exercise. Lying on a cold floor will sometimes produce the trouble, in which case there is probably rheumatic complications. Your food seems to be all right except the peameal. Cut out the peameal. If possible turn the pigs out where they can run abodt for exercise, and if they can root in the ground all the better. If ground is frozen throw some of the dirt which may be found among the mangolds into the pen. Give the sick pig 2 ounces of Epsom salts, and follow up with 2 grains of nux vomica, three times a day. This trouble is often most difficult to treat successfully. The disease is not contagious, but often pigs exposed to the same conditions develop the trouble.

WHEREVER the old wheelbarrow cleaning system is used you find a mussy stable.

It's too much to expect that a man will brush and sweep the passage ways every time he cleans the stable. He hasn't the time for one thing—and it's discouraging work for another.

But nowadays we think more about clean stables.

We know that dirty stables breed disease.

It's up to you, Mr. Farmer, to make your stable easy to clean — then it will always be clean.

You can learn something about how to do this in Dillon's Book on Clean Stables, which is sent free to Farmers. Dillon's make a Litter Carrier that lightens work about the stable. It's an equipment any man can put up, and is adaptable to stables large or small. The free book explains it fully.

DILLON'S Litter Carrier

Figure it out for yourself. Get our free book.

Dillon's sell direct to the Farmer. There are no Agents and no Agents' profits. The price is the same to all, and lower than you would expect for such substantial and well-built equipment. DILLON'S BOOK ON CLEAN STABLES gives you an exact idea of what you can accomplish for a small outlay. Write for a free copy. 1

MAPLE EVAPORATORS

TO THE LIVE FARMER OUR PERFECT MAPLE EVAPORATORS AND A SUGAR BUSH CAN BE MADE TO PRODUCE A REVENUE WHEN IT IS MOST NEEDED.

With our Maple Evaporator, sap is easily and economically converted into the finest quality maple syrup.

The body of the perfect evaporator is made of heavy sheet steel, thoroughly riveted and braced with steel angle and fitted with cast iron door and faame.

The working of the evaporator is very simple—put the sap in at one end and it comes out syrup at the other.

THE HORSE.

The Dual-Purpose Farm Horse.

There can be no question but that a great improvement has been made in the character of animals used upon the farms in this country during the present generation, and yet it is considered by many of the most intelligent students of agricultural problems that the tendency to use nothing but heavy draft animals on the farm is likely to result injusiously in many instances.

In considering the kind of horses most desirable for general farm work, it will probably be agreed that for heavy work, such as plowing, hauling logs and marketing farm produce, no other animals can compare with the draft breeds weighing from 1,400 to 1,800 pounds, and if this class of work were all that a farm team was required to perform there would remain no room for discussion. But in determining the character of team most desirable for the average farmer, the important fact is generally overlooked that when, as is generally the case, the farmer keeps but one team, those horses are not only required to do the heavy farm work, but are used as driving horses when the farmer wishes to attend church at a distant village or some member of the family desires to do shopping or has other errands of a social or business nature to attend to. As a rule, almost without exception, the draft horses that are so desirable when heavy loads have to be moved are slow and in every way unsatisfactory for road driving where pace, style and breedy appearance constitute desirable characteristics.

Of course when, as is sometimes the case, a farmer keeps a team for heavy work and one or more horses for road driving, it matters not how heavy, slow and plain the work team may be, so long as it is capable of performing the service required. It seems to be an accepted truism that, in order to keep the boys on the farm, farm life must be made as attractive as possible, and obviously one of the most potent factors in accomplishing this result in the case of the average farmer's son is a handsome, stylish and fast-stepping horse or pair that he will take pride in driving when he goes to call upon his best girl or to the village on errands. If, therefore, the farmer is to keep but two horses for all purposes, what character af horse is best suited to perform the various duties incident to modern-day life upon the farm, and how should he go about the production of such a type of horse as his necessities require? There can be no doubt that the most important consideration in determining the first inquiry is that whatever breed of horse he may select he must have weight and muscular development sufficient for all heavy hauling purposes. This element alone can be secured by obtaining the produce and generally the half-bred produce of either the Percheron, Clydesdale, Belgian or Shire. But as satisfactory as all of these breeds are in the spheres for which they are adapted, none of them meets the requirements of such an all-around horse as I have indicated. If sufficient weight and muscular development can be obtained, and also the style of fast-stepping qualities re' quisite for an all-purpose horse, by delving into some other breeds not designated as heavy draft breeds, it would seem to be part of wisdom to select such a strain in solving the problem with which the farmer is confronted.

It will doubtless be generally admitted that a pair of horses weighing from 2,600 to 2,800 pounds, if built upon substantial lines, is sufficiently for most farm work. The farmer is not necessarily obliged to go to the heavy draft breeds in prosecuting his search for animals of this weight. The French and German coach horses as well as the Cleveland Bays meet this requirement, and frequently Hackneys and trotting-bred animals weigh this much and more. The mistaken theory once obtained among horsemen that beauty and high finish in a horse was a handicap to his racing and hauling ability, but this notion was exploded long ago.

A general-purpose farm horse then can be said to be an animal measuring at least 16 hands and weighing from 1,300 to 1,600 pounds; with well developed muscles, an arched neck, sloping shoulders, short back, a flat and heavy boned leg, perfect feet, small ears, large and intelligent eyes and a breedy appearance, and that possesses the ability to walk fast and road along at the rate of 8 or 10 miles per hour. Such an animal might be produced by breeding a large, well-developed trotting-bred mare to one of the best heavy stallions, but the chances for producing the desired animal will be much better to cross such a mare with a French or German Coach horse or a Cleveland Bay stallion, all of which breeds have been produced for many generations for the sole object of obtaining size, beauty, strength, substance and pace.—Manhattan, in Breeders' Gazette.

Size and Quality of Bone.

A study of draft horses reveals the great difficulty in securing extreme quality and great size and bone in the same horse. Draft horse buyers are insistent upon big bone, but the term applies most properly to great width of the canon as viewed from the side. The demand for large bone, as it is called, arises primarily from the fact that legs in which the tendons are set far back from the canon-bones are thought to be strongest. If the bone itself is also large the horse has more weight, and heavy muscle usually goes with a heavy frame.

Some of the best draft horse judges, however, pay prartically no attention to the size of the bone itself; that is, they do not discriminate against a horse whose canons are narrow as viewed from the front. They like big knees and well shaped hocks of ample size, but they assert that since the bones themselves almost never break one may safely disregard the circumference. Quality is really more important than size of bone.

Fine hair, soft skin and clean cordy canons indicate a strong vitality in the cells making up the tissues of the whole body, and are associated with thgt stamina which gives maximum utility through long years of use. On the other hand; coarse soft bone is not associated with the active durable type of horse, and is never found in horses which have endured a long lifetime of hard service. It is not the smooth hard bone but the rough soft bone that most often develops unsoundness, so in the search for size of bone quality must never be neglected.—Breeders' Gazette.

Vicious mare and foal.—I have recently bought a mare in foal, and since then I have been informed that on the last occasion she would not let her foal suck. She kicked and bit at it, and she could not foster it on her anyhow, and it had to be brought up by hand. May I venture to ask how I could treat her if she is in the same way this time? I may say that she bites viciously if touched now.

If, as it is by no means unlikely that she will, the mare refuses to take to her foal, or permit it to suck when it is born, you will have to do as her previous owners did, take it away and bring it up by hand, unless you are fortunate enough, which rarely happens, to find a foster-mother for it in a mare of kindlier disposition, who has lost her foal within a few days of its birth. Occasionally, one meets with mares such as you scribe, that obstinately refuse to have anything to do with their offspring, particularly in the matter of permitting it to suck. Some are so disinclined to accept the duties of maternity, that they will attack the foal viciously if it approaches. There is no remedy. You may protect the foal from injury while you remain present, and so secure the mare that she may be compelled to let it suck, but when you are gone she will probably do it serious injury, or at least refuse to let it approach the teat. The only suggestion we can offer, and in view of the behavior of the animal it is a forlorn hope, is that during the time that remains before the mare is due to foal you train her to submit to have her teats handled freely. By kindness and firmness, accompanied by suitable restraint and the putting on of a muzzle, she may, after persistent endeavour, submit to this being done, and if you succeed it may make some difference in her attitude towards the foal when it is born.

Horsemen Attention!

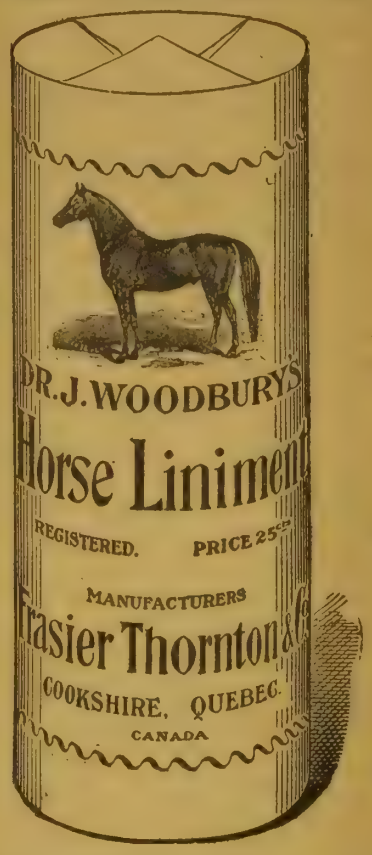
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Pow drs will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

Demand

DR. J. Woodbury's Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

ABSORBINE

will reduce inflamed, swollen Joints, Bruises, Soft Bunches. Cure Boils, Poll Evil, Quitor, Fistula or any unhealthy sore quickly; pleasant to use; does not blister under bandage or remove the hair, and you can work the horse. $2 per bottle, delivered. Book 7 E free.

ABSORBINE, JR., liniment for mankind. Reduces Painful, Swollen Veins, Goitre, Wens, Strains, Bruises, stops Pain and Inflammation. Price $1.00 per bottle at dealers or delivered. Will tell you more if you write. Manufactured only by W. F. YOUNG, P.D.F., 124 Lymans Bldg., Montreal, Ca-

POULTRY.

The Treatment of Autumn Laying Pullets.

At the present time the question of the correct treatment of autumn laying pullets is uppermost in the minds of most poultry keepers. Practically the claims of most of those pullets that are laying may be quickly dismissed; it is those pullets hatched for autumn laying, and which are not laying, that cause concern to their owners. The old story of "too fat" or "too thin" will again crop up, as well as the perplexing problem as to whether they are having sufficient or otherwise, of the right quality of food for egg production. Before deciding on any course, we must examine the birds; night is the best time to do this, for at that time they are easily lifted from the perch, without the trouble of chasing them, which latter, in my opinion, is never beneficial to the pullet about to produce, or producing eggs. On handling the birds, do you find them nice and plump in the hand? Is the breast well developed, the legs thick and firm, and can the gizzard be felt rather plainly through the walls of the abdomen? This region, wrongly termed by some "cushion," and more correctly the "egg bag," although in reality neither, is the part covered by fluff beyond the end of the breast bone (the breast bone commences at the crop). This "bag" as it feels, should be large, soft and yielding, and as we said before, the gizzard should be distinctly felt through its walls. If this is so, and yet the pullets are not laying, some little change in diet may be all that is needed to give them a start. I may here say that this is a dangerous condition for the pullets to be in, because if they do not soon lay they will soon gather fat round the internals, and a fat hen is not the best of layers. A flock of birds in this condition should first of all have a good stiff dose of Epsom salts, a good half teaspoonful dissolved in hot water, and for the sake of convenience—if the flock be a large one—placed in their soft food. It would be quite as effective in their drinking water, but they might not take it in that strength. Repeat the dose in a couple of days' time.

With regard to diet, these pullets require rather more flesh-forming matter, an extra allowance of meat or bone at this functure is most beneficial. As to amount, as they are not laying, do not stick to the stipulated one ounce each, a little more will not hurt if they will take it, but when eggs are forthcoming reduce to the regulation amount. In the way of soft food a little extra biscuit meal, or some cooked meal, will help them along; so would a few doses of tonic, but this should not be given on the days the Epsom salts are used. Look carefully through your foodstuffs and see if such things as pea meal, malt, meat meal, biscuit meal, fish meal, or any of the specially prepared meals are amongst them; if not, one of these egg and flesh formers should be included in the daily dietary, more particularly so when meat or cut bone is not given at midday.

PULLETS TOO THIN FOR LAYING.

We must now consider the pullets that were thought too thin, these were very angulae, their bones pointed and hard, thighs rather stringy, and small abdomen. Surh birds will not lay just yet, even months may elapse before they do lay, unless they are taken in hand at once. These pullets require more food and better food. Give soft food every other day at noon, a similar mash to what they have in the morning. Or the wheat may be boiled occasionally. See that full, allow as much grain as they they always retire with a good crop will pick up at night, and give such birds a good tonic. To such birds as these the "ovary tonics" advertised are very helpful, but stick to the directions, it is folly to exceed them. One handful of hemp seed to every four of other grain will also help them to pick up in condition, and it goes without saying that they should have a free supply of meat or cut bone.

Treated in this way, they will gain rapidly in condition, and lay perhaps two months before they would have done in the ordinary course of events; indeed, they should provide eggs for the Christmas breakfast table.

The most hopeless pullets are those that are too fat. Here we must reduce them, always a slow process, and then build them up again. In this case withhold soft food and give oats, or, better still, white Canadian peas instead. I am quite prepared to hear you say they will not take them; so place them in a trough first of all, and if they refuse, take it away until next meal time, it is the only way, and in their pampered, overfed condition, missing a meal or two will do more good than harm. Here Epsom salts should be given daily in their drinking water, one full teaspoonful dissolved in hot water, and made up to half-pint with cold to be taken during the day, as they think fit. Continue this and the scanty grain feeding until they are in fair form again. Probably about one ounce each of oats for supper will be plenty, and rather less for breakfast, whether they be oats or peas it should be the latter when possible. There would be no harm in allowing these overfat birds to have a little cooked or raw, but very lean meat—but not cut bone.

GENERAL MANAGEMENT.

We cannot expect the pullets to lay if they are constantly moved about to suit some fancy of their owner; no, the pullets, like the small holder, desire some fixity of tenure, place them once and for all in the runs they are to occupy during the winter, and do not move them again. Cockerel or no cockerel is another question personally I think a cockerel should be turned down with them whenever possible, not that they will not lay if one be not present in the run, but many people find that the pullets settle better and commence laying sooner if a cockerel is allowed in the pen.

See that they all have ample room on the perch, and that none squat about on the floor or in the nest boxes, allow fresh air without draught and keep the birds as busy as possible during the daylight hours if they have not a large grass run on which to disport themselves. In the case of confined runs much can be done to promote exercise by burying their grain fairly deep in the litter of their scratching shed and by suspending their green food at such a height that it can only be reached by a short jump. To summarise, the pullets must be comfortable and be suitably fed, fairly warm and sheltered, and in good condition, all simple things, but sometimes difficult of attainment. Do not allow the grass to grow under your feet, feed up those that need it; reduce the rations where necessary; alter the quality if required, and allow the pullets to remain in one pen; mate up and allow the cockerel to remain in the pen; do not be always changing males, remember the grit, both shell and flint, and this untiring, well-directed energy will not go long unrewarded by a full egg basket.—By W. Hooley, in The Poultry World.

The Poultry Industry of Canada.

During the past session of the Dominion Parliament, Mr. A. G. Gilbert, Poultry Manager at the Central Experimental Farm, gave evidence before the Select Standing Committee on Agriculture and Colonization on the development of the poultry industry. This evidence, which includes an address followed by questions put to Mr. Gilbert and answered by him, has been printed in pamphlet form for public distribution the subject is dealt with under the following heads: The value of the poultry industry, how the industry is tending, the attitude of the farmer towards it, and the form of development best calculated to help the farmer.

It is clearly shown that the demand for eggs in Canada has increased much more rapidly than the supply during recent years. In 1902 we exported to Great Britain, eggs to the value of $1,733,242; nine years later, the exports had fallen to less than a value of twenty-five thousand dollars, while the imports in 1911 reached a value approaching half a million dollars.

It is pointed out that farmers are not taking full advantage of the high prices offered for strictly new laid eggs at all seasons if the year. The good profits from these are besecured choefly by specialists who are often at the disadvantage of having to pay retail prices for feed. Much useful information is contained in this pamphlet which may be procured from the Publications Branch, Department of Agriculture, Ottawa.

Telling What Hens are Laying.

The great question for the average poultry keeper is how to weed out his non-layers. A little advice, gleaned from the Kansas State Agricultural College, may be useful along this line:—

The first thing to notice concerning the shape is as to whether or not the hen is rangy or blocky. A blocky hen indicates a meat-producer, while the more rangy one indicates the production of eggs. Since the development of the egg, to a large extent, takes place in the region of the body below the broad part of the back, that part of the body should be broader than the fore part. This gives to the body a V shaped appearance as viewed from the top, and small part of the V lying towards the front. When a hen is in heavy laying condition her abodmen is lower than the breastline. This gives the body the appearance of being V shaped as viewed from the side along the top and bottom lines, with the small part of the V towards the front. Tnis enlargement of the body in the abdominal region makes the back appear somewhat narrower, giving the body a V shaped aupearance from the back downward on the sides as viewed from the rear. Thus, a body V shaped in three directions indicates large productive powers.

A large hen usually lays the larger eggs. This rule may not hold true if she happens to be a heavy producer for them the tendency is to produce smaller eggs. With such fowls as the Leghorns, whose tendency is to lay smaller eggs, the selection should be for large size of body rather than small.

A good layer is longer in body, neck and legs than a meat-producing hen. She stands up well, and has a well-spread tail. Observation has shown that a pinch tail Leghorn is not generally as good a layer as is a fantailed one.

The character of the head firnishings is an indication of the hen's laying condition. When a hen is in full laying her comb is full and bright red. Some Plymouth Rocks when laying heavily will have lopped combs and, therefore, become disqualified as show birds.

When hens are moulting they lose all their color in face and comb, and their combs become very small, but as soon as laying commences combs enlarge and the color returns. Many instances have been noted with Leghorns and Minorcas which indicate that the birds with the largest and reddest combs are in heavy-laying condition. Exceptions to this rule sometimes occur, but they are rare.

A laying hen is nearly always a singing hen. She works and hunts for food all day, is the first off the roost and the last to go to roost. She is nervous and very active, keeping herself up to the greatest possible pitch.

The pelvic bone test is a test which some have claimed as final and conclusive. Immediately below the tail at the end of side pieces of the back are two somewhat bony protuberances. These are called the pelvic or "lay" bones, and are just above the vent through which the eggs must pass. When an egg is laid, these bones must be forced apart to allow its free passage. When these bones are soft and pliable and spread sufficient to allow three fingers to be placed between them, it is an indicare hard and bony, and close tion that the hen is laying. If they gether, the hen would not be considered as laying at that time. Experience has shown that this method will usually tell whether or not a hen is laying at the time the examination was made.

Teach Chicks to Roost.

Half-grown chicks are too often not taught to roost. They crowd each other in the brood coops, get crooked breasts and many are smothered. I begin to teach them as soon as the hen leaves them. I fix low, broad perches and at first put them on the roosts perhaps several times in one evening if they step off and don't seem to know enough to get back. After a few times they get on the perches themselves. My chicks always gain much faster when they begin roosting. I keep the roosts soaked with kerosene oil to guard against mites.

Warranted to Give Satisfaction.
Gombault's
Caustic Balsam

Has Imitators But No Competitors.
Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.
As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address
The Lawrence-Williams Co., Toronto, Ont.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

THE SLATTERN WOMAN.

I sing me a song of the sloven,
Of the woman who has no pride,
Who does not care
If her raiment bear
A stain or a spot or a snag or a tear
Nor blush to be caught in the morning glare
With run-down heel and with towsled hair—
With plenty of time but with none to spare
For little attention to keep her fair
In the eyes of the man who found her rare
And wholesome ere
Her charm and her freshness died.

She twists her locks in a frowsy knot
Her dressing gown bears a great grease clot,
The rip in the back of her sacque she's forgot;
There's a stain on her skirt and an ugly hole
In the heel of her stocking and one in the sole
Of both her slippers, that plainly show
The need of rejection at each worn toe.

There are empty shelves in her lone bookcase;
She makes no effort to keep in pace,
As her husband steadily climbs to place,
Nor stirs herself to a single grace;
With never a fear 'gainst the time he'll find,
How slothful and narrow and dull's her mind;
No thought she gives to the subtle arts,
That stoke the fires within men's hearts.

She stands stock-still while his world speeds on,
Till at last she is simply a pricking thorn
In his side. All the rose that she was is gone;
By her hands alone are his visions torn—
The softening veils that affection wrought
To keep her the sweetheart and wife that he sought—
Herself she must thank that his dream is wrecked,
For men lose love when they lose respect.

I sing me a song of the slattern,
Of the woman who sits alone,
Who had her day and who threw away
Her chances when beauty and wit could play,
Who lazed and who lounged and who did not stir,
A finger to add to the charm of her,
Who would not of lotions and unguents and myrrh—
The story's not new and anew 'twill occur;
As she erred, so will many another fool err.—Herbert Kaufman in Woman's World.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

"What's amiss, dame!" said Mr. Peggotty.

"Nothing," returned Mrs. Gummidge. "You've come from the Willing Mind, Dan'l?"

"Why yes, I've took a short spell at the Willing Mind to-night," said Mr. Peggotty.

"I'm sorry I should drive you there," said Mrs. Gummidge.

"Drive! I don't want no driving," returned Mr. Peggotty with an honest laugh. "I only go too ready."

"Very ready," said Mrs. Gummidge, shaking her head, and wiping her eyes. "Yes, yes, very ready. I am sorry it should be along of me that you're so ready."

"Along o' you! It an't along o' you!" said Mr. Peggotty. "Don't ye believe a bit on it."

"Yes, yes, it is," cried Mrs. Gummidge. "I know what I am. I know that I am a lone lorn creetur, and not only that everythink goes contrary with me, but that I go contrary with everybody, Yes, yes, I feel more than other people do, and I show it more. It's my misfortun."

I really couldn't help thinking, as I sat taking in all this, that the misfortune extended to some others members of that family besides Mrs. Gummidge. But Mr. Peggotty made no such resort, only answering with another entreaty to Mrs. Gummidge to cheer up.

" I an't what I could wish myself to be," said Mrs. Gummidge. "I am far from it. I know what I am. My troubles has made me contrairy. I feel my troubles and they make me contrairy. I wish I didn't feel 'em, but I do. I wish I could be hardened to 'em, but I an't. I make the house uncomfortable. I don't wonder at it. I've made your sister so all day, and Master Davy."

Here I suddenly melted and roared out, "No, you haven't, Mrs. Gummidge," in great mental distress.

"It's far from right that I should do it," said Mrs. Gummidge. "It an't a fit return. I had better go into the house and die. I am a lone lorn creetur, and had much better not make myself contrairy here. If thinks must go contrairy with me, and I must go contrairy myself, let me go contrairy in my parish. Dan'l I'd better go into the house, and die and be a riddance!"

Mrs. Gummidge retired with these words, and betook herself to bed. When she was gone, Mr. Peggotty, who had not exhibited a trace of any feeling but the profoundest sympathy looked round upon us, and nodding his head with a lively expression of that sentiment still animating his face, said in a whisper:

-.She's been thinking of the old 'un!"

I did not quite understand what old one Mrs. Gummidge was supposed to have fixed ner mind upon, until Peggotty, on seeing me to bed, explained that it was the late Mr. Gummidge; and that her brother always took that for a received truth on such occasions, and that it always had a moving effect upon him. Some time after he was in his hammock that night, I heard him myself repeat to Ham, "Poor thing! She's been thinking of the old 'un!" And whenever Mrs. Gummidge was overcome in a similar manner during the remainder of our stay (which happened some few times), he always said the same thing in extenuation of the circumstances, and always with the tenderest commiseration.

So the fortnight slipped away, varied by nothing but the variation of the tide, which altered Mr. Peggotty's times of going out and coming in, and altered Ham's engagements also. When the latter was unemployed, he sometimes walked with us to show us the boats and ships, and once or twice he took us for a row. I don't know why one slight set of impressions should be more particularly associated with a place than another, though I believe this obtains with most people, in reference especially to the associations of their childhood. I never hear the name, or read the name, of Yarmouth, but I am reminded of a certain Sunday morning on the beach, the bells ringing for church, little Em'ly leaning on my shoulder, Ham lazily dropping stones into the water, and the sun, away at sea, just breaking through the heavy mist, and showing us the ships, like their own shadows.

At last the day came for going home. I bore up against the separation from Mr. Peggotty and Mrs. Gummidge, but my agony of mind at leaving little Em'ly was piercing. We went arm-in-arm to the public house where the carrier put up, and I promised, on the road, to write to her. I redeemed that promise afterwards, in characters larger than those in which apartments are usual,y announced in manuscript, as being to let. We were greatly overcome at parting; and if ever, in my life, I have had a void made in my heart, I had one made that day.

Now, all the time that I had been on my visit, I had been ungrateful to my home again, and had thought little or nothing about it. But I had no sooner turned towards it, than my reproachful young conscience seemed to point that way with a steady finger; and I felt, all the more for the sinking of my spirits, that it was my nest, and that my mother was my comforter and friend.

This gained upon me as we went along; so that the nearer we drew and the more familiar the objects became as we passed, the more excited I was to get there, and to run into her arms. But Peggotty, instead of sharing in these transports, tried to check them (though very kindly), and looked confused and out of sorts.

Blunderstone Rookery would come, however,- in spite of her, when the carrier's horse pleased—and did. How well I recollect it, on a cold, grey afternoon, with a dull sky, threatening rain.

The door opened, and I looked, half laughing and half crying in my pleasant agitation, for my mother. It was not she, but a stranger servant.

"Why, Peggotty!" I said, ruefully, "isn't she come home?"

"Yes, yes, Master Davy," said Peggotty. "She's come home. Wait a bit Master Davy, and I'll—I'll tell you something."

Between her agitation, and her natural awkwardness in getting out of the cart, Peggotty was making an extraordinary festoon of herself, but I felt too blank and strange to tell her so. When she had got down, she took me by the hand; led me, wondering, into the kitchen, and shut the door.

"Peggotty!" I said, quite frightened. "What's the matter?"

"Nothing's the matter, bless you, Master Davy dear!" she answered, assuming an air of spritliness.

" Something's the matter, I'm sure. Where's mamma?"

"Where's mamma, Master Davy?" repeated Peggotty.

"Yes. Why hasn't she come out to the gate, and what have we come in here for? Oh, Peggotty!" My eyes were full, and I felt as if I were going to tumble down.

"Bless the precious boy!" cried Peggotty, taking hold of me. "What is it? Speak, my pet!"

"Not dead, too? Oh, she's not dead, Peggotty?"

Peggotty cried out No! with an astonishing volume of voice, and then sat down, and began to pant, and said I had given her a turn.

I gave her a hug to take away the turn, or to give her another turn in the right direction, and then stood before her, looking at her in anxious inquiry.

"You see, dear, I should have told you before now," said Peggotty, "but I hadn't an opportunity. I ought to have made it, perhaps, but I couldn,t azackly"—that was always the substitute for exactly, in Peggotty's militia of words—"bring my mind to it."

"Go on, Peggotty," said I, more frightened than before.

"Master Davy," said Peggotty," untying her bonnet with a shaking hand, and speaking in a breathless sort of way. "What do you think? You have got a Pa!"

I trembled and turned white. Something—I don't know what, or how—connected with the grave in the churchyard, and the raising of the dead, seemed to strike me like an unwholesome wind.

"A new one," said Peggotty.

"A new one?" I repeated.

Peggotty gave a gasp, as if she were swallowing something that was very hard, and, putting out her hand, said:

"Come and see him."

I don't want to see him."

—"And your mamma," said Peggotty.

I ceased to draw back, and we went straight to the best parlor, where she left me. On one side of the fire, sat my mother; on theother Mr. Murdstone. My mother dropped her work, and rose hurridly, but timidly I thought.

"Now, my dear," said Mr. Murdstone. "Recollect! control yourself, always control yourself! Davy boy, how do you do?"

I gave him my hand. After a moment of suspense, I went and kissed my mother: she kissed me, patted me gently on the shoulder, and sat down again to her work. I could not look at her, I could not look at him, I knew quite well that he was looking at us both; and I turned to the window and looked out there at some shrubs that were drooping their heads in the cold.

As soon as I could creep away, I crept up stairs. My old dear bedroom was changed, and I was to lie a long way off. I rambled downstairs to find anything that was like itself, so altered it all seemed; and roamed into the yard. I very soon started back from there, for the empty dog-kennel was filled up with a great dog—deep-mouthed and black-haired like Him—and he was very angry at the sight of me, and sprang out to get at me.

CHAPTER IV

I Fall Into Disgrace.

If the room to which my bed was removed were a sentient thing that could give evidence, I might appeal to it to this day—who sleeps there now, I wonder!—to bear witness for me what a heavy heart I carried to it. Iwent up there, hearing the dog in the yard bark all the way after me while I climbed the stairs; and, looking as blank and strange upon the room as the room looked upon me, sat down with my small hands crossed, and thought.

I thought of the oddest things. Of the shape of the room, of the cracks in the ceiling, of the paper on the wall, of the flaws in the window-glass making riples and dimples on the prospect, of the washing-stand being ricketty on its three legs, and having a discontented something about it, which reminded me of Mrs. Gummidge under the influence of the old one. I was crying al the time, but, except that I was conscious of being

cold and dejected, I am sure I never thought why I cried. At last in my desolation I began to consider that I was dreadfully in love with little Em'ly, and had been torn away from her to come here where no one seemed to want me, or to care about me, half as much as she did. This made such a very miserable piece of business of it, that I rolled myself up in a corner of the counterpane, and cried myself to sleep.

I was awakened by somebody saying "Here he is!" and uncovering my hot head. My mother and Peggotty had come to look for me, and it was one of them who had done it.

"Davy," said my mother. "What's the matter?"

I thought it was very strange that she should ask me, and answered, "Nothing." I turned over on my face, I recollect, to hide my trembling lip, which answered her with greater truth.

"Davy," said my mother. "Davy, my child!"

I dare say no words she could have uttered would have affected me so much, then, as her calling me her child. I hid my tears in the bedclothes, and pressed her from me with my hand, when she would have raised me up.

"This is your doing, Peggotty, you cruel thing!" said my mother. "I have no doubt at all about it. How can you reconcile it to your conscience, I wonder, to prejudice my own boy against me, or against anybody who is dear to me? What do you mean by it, Peggotty?"

Poor Peggotty lifted up her hands and eyes, and only answered, in a sort of paraphrase of the grace I usually repeated after dinner, "Lord forgive you, Mrs. Copperfield, and for what you have said this minute, may you never be truly sorry!"

"It's enough to distract me," cried my mother. "In my honeymoon, too, when my most inveterate enemy might relent, one would think, and not envy me a little piece of mind and happiness. Davy, you naughty boy! Peggotty, you savage creature! Oh, dear me!" cried my mother, turning from one of us to the other, in her pettish, wilful manner. "What a troublesome world this is, when one has the right to expect it to be as agreeable as possible!"

I felt the touch of a hand that I knew was neither hers nor Peggotty's and slipped to my feet at the bedside. It was Mr. Murdstone's hand, and he kept it on my arm as he said:

"What's this? Clara, my love, have you forgotten?—Firmness, my dear!"

"I am very sorry, Edward," said my mother. "I meant to be very good, but I am so uncomfortable."

"Indeed!"- he answered. "That's a bad hearing, so soon, Clara."

"I say it's very hard I should be made so now," returned my mother, pouting; "and it is—very hard—isn't it?"

He drew her to him, whispered in her ear, and kissed her. I knew as well, when I saw my mother's head lean down upon his shoulder, and her arm touch his neck—I knew as well that he could mould her pliant nature into any form he chose, as I know, now, that he did it.

"Go you below, my love," said Mr. Murdstone. "David and I will come down, together. My friend," turning a darkening face on Peggotty, when he had watched my mother out, and dismissed her with a nod and a smile "do you know your mistress's name?

"She has been my mistress a long time, sir," answered Peggotty. "I ought to know it."

"That's true," he answered. "Tut I thought I heard you, as I came up stairs, address her by a name that is not hers. She has taken mine, you know. Will you remember that?"

Peggotty, with some uneasy glances at me, curtseyed herself out of the room without replying; seeing, I suppose, that she was expected to go, and had no excuse for remaining. When we two were left alone, he shut the door, and sitting on a chair, and holding me standing before him, looked steadily into my eyes. I felt my own attracted, no less steadily, to his. As I recall our being opposed thus, face to face, I seem again to hear my heart beat fast and high.

Flour and Breadmaking.

(Continued from last issue)

STRONG vs WEAK FLOUR FOR BAKING POWDER BISCUITS.

It is the opinion of some bakers that the strong spring wheat flours are better for making baking powder biscuits than the softer and weaker flour from the winter wheats. The opposite view is just as strongly held by others. To secure definite data on this point some experimental work was done in the Macdonald Institute with six different kinds of flour, including both strong and soft flours and also blended flour. We quote from the report given in the Ontario Agricultural Report for 1908:

"The flours used were obtained from the manufacturers for other purposes, but were regular brands, which might have been bought in the open market, and were chosen as likely to yield decisive information. They were:

"A. Strong—A high patent flour, made wholly of Manitoba wheat.

"B. Strong—A high patent flour, made wholly of Manitoba wheat.

"C. Soft—A nearly straight grade flour, made wholly of Ontario wheat.

"D. Blend—A combination of 20 per cent. B strong and 80 per cent. C soft.

"E. Soft—An 85 per cent. soft wheat flour; made wholly from Ontario wheat.

"F. Soft—A 35 per cent. soft wheat flour, made wholly from Ontario wheat.

"The Macdonald Institute recipe for milk biscuits was taken as the starting point, and a series of experiments carried out to determine various points before making the final test. In every baking each ingredient was carefully weighed, the biscuits compared with others, and results recorded to guide the procedure of the next experiment. When rolling out the dough before cutting the biscuits flat sticks of equal thickness were laid on either side for the rolling-pin to travel on, so that the biscuits of all bakings were as nearly alike in thickness before baking as was possible with dough of such slackness. Only the biscuits cut from the first rolling were baked, so that no biscuits were made from dough that had been worked over."

Experimental bakings were made to determine what proportion of fat, baking powder, and what oven temperature would yield the best results. Experimental bakings were made to determine the proportion of milk needed for each flour, in order to have each dough of the same slackness, the effect of doughs of different slackness, etc. Finally, making use of the experience gained with each flour, a concluding baking was made.

"The ingredients for each batch (except the milk) were weighed and mixing was done. The mixing and baking were done as rapidly as possible. Nine biscuits of each flour kept carefully separate before any were baked; when sufficiently cooled the best six of each were numbered and placed in a covered wooden box to prevent drying out before they were judged. The following table gives the weight of each ingredient used in making the bisruits and the weights recovered after baking.

Baking No.	Flour	Weight in grams of Flour	Butter	Bak. Pow.	Milk	Dough	Biscuits Raw	Biscuits Baked	Oven Temp. Fah.	P. cent loss in baking
24.	A. Strong	300	24	16	252	592	308	257	450°	16
25.	B. "	300	24	16	248	588	307	257	450°	16
26.	C. Soft	300	24	16	212	552	323	260	450°	19
27.	D. Blend	300	24	16	221	561	306	259	430°	15
28.	E. 85% Soft	300	24	16	222	562	305	257	450°	14
29.	F. 35% "	300	24	16	218	558	295	247	450°	16

"When baked, these biscuits were much alike in general appearance. In the A. O. C. Chemical Building, about twelve hours after the biscuits were finished. All the numbered biscuits were carried over, the meeting informed of the uniformity of manipulation, quantities of flour, fat, and baking powder, but not told the names of the flour or quantities of milk used, and the meeting asked to judge which were best. A committee of three was appointed, which reported Nos. 28 and 29 as best, but declined to rank one above the other. The committee stated that there was so little difference between the other lots that judgement between them was very difficult.

"Conclusion—Soft wheat flours yield the tenderest biscuits when conditions are uniform.

"Remarks.—When strong and weak flours are made slack enough for biscuits, and both are of the same slackness, the difference in "handling quality is very noticeable. The strong flour dough has a stickiness like glue, while the soft flour has a owing to the care taken in proportioning ingredients, maintaining oven temperature, and in manipulation; but the experimenter judged the first two about equal; C soft, rather better; 85 per cent. decidedly best, with 35 per cent. a close second.

"The Dominion Millers' district meeting was held in Guelph, December 12, 1907. One session was held

WHOOPING COUGH

LEFT A NASTY, DRY COUGH.

Doctors Could Do No Good.

Mrs. A. Mainwright, St. Mary's, Ont., writes:—"I feel it my duty to write and tell you the good your Dr. Wood's Norway Pine Syrup did for my little boy. He had whooping cough, which left him with a nasty, dry hard cough. I took him to several doctors, but they did him no good, and I could see my little lad failing day by day. I was advised to take him to another doctor, which I did, and he told me he was going into a decline. I was telling a neighbour about it, and she told me to get a bottle of Dr. Wood's Norway Pine Syrup, and give it to him regularly. She then got to tell me how much good it did her children, so I got a bottle, and gave it to my little boy, and was so pleased with the result that I bought another one, and by the time he had finished it he had no cough. He is now fat and strong, and I would not be without a bottle in the house on any account."

Whooping cough generally begins as a common cold, accompanied with coughing and a slight discharge from the nose. It is, as a rule, more of a child's trouble but also affects adults.

Dr. Wood's Norway Pine Syrup is a sure preventative if taken in time, and is also a positive cure for any of the after effects.

"Dr. Wood's" is put up in a yellow wrapper, three pine trees the trade mark; price 25 and 50 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Quality Butter

That's the kind you make with Maxwell's "Favorite" Churn.—

Maxwell's "Favorite" is used all over the world—in Denmark, the butter country of the world—in the United States, in spite of high tariffs—and in every Section of Canada. Our Agricultural Colleges and Govt. Inspectors recommend it, because it is the finest butter-maker in the world.

Write for catalogue if your dealer does not handle it.

Learn Engineering

Complete courses by mail in stationary, traction, gas or gasoline, automobile or locomotive. We prepare you for government certificate. Write Canadian Correspondence College, Limited, Dept. K., Toronto, Canada.

Don't waste your money by buying strengthening plasters. Chamberlain's Liniment is cheaper and better. Dampen a piece of flannel with it and bind it over the affected parts and it will relieve the pain and soreness. For sale by all dealers.

ier to handle.

"Summary.—1. Other things being equal, soft wheat flours make more tender milk biscuits than strong wheat flour.

"2. Given a strong wheat flour dough and a soft wheat flour dough of equal slackness and suitable for milk biscuits, the soft wheat flour dough is the easiest to handle.

"3. At the present prices of the different flours the strong wheat flour biscuits cost more than soft wheat flour biscuits.

"4. It is possible that a larger proportion of fat used with the strong wheat flour would yield biscuits of tenderness equal to those of soft wheat flour, but the cost of fat makes that method of improvement a disadvantage."

(Continued in next issue)

Boots and Shoes.

A few usefal hints regarding boots and shoes should be pasted in the scrap book for reference. Wet boots and shoes are miserably uncomfortable things to wear, and those people who are compelled to travel much in wet weather will do well to have a stout pair well soaked in dubbin. Rub it well in, esoecially into the welts, as it is just there that the wet finds its way to the feet. When they become wet fill them with some pieces of absorbent material—tissue or any kind of soft paper will do. It will also keep them in shape. Never "tree" boots or shoes while they are wet. Rub a little Kerosene well into hardened boots; it wil, soon soften them and prevent the formation of many a painful corn. Damp boots will shine up in quick time if a couple of drops of paraffin be added to the polish; this will also stop cracking. Squeaky boots will lose their song if the soles be soaked in linseed oil for a couple of hours.—G. R. C.

Free Literature About Birds.

The Audubon society is organizing many thousands of school children and other young people into classes for bird study, and aids in many other ways educational work along the lines of bird study.

It publishes and distributes thousands of illustrations of North American birds, accompanied by leaflets containing in popular form a resume of the latest known facts regarding the feeding habits and general activities of the birds described.

Address the society at 1974 Broadway, New York, and enclosed stamped and addressed envelope.

Neuralgia.

The most stubborn cases of neuralgia are apt to yield to hot water treatment. Wherever the pain is located, there a hot water bag should be applied. The suffering part should be covered with a blanket and the patient put to bed and covered with more blankets and induced to drink at least three cups of water as hot as the palate can stand. This treatment may seem severe, but it is sure to bring relief. Of course, the patient should be careful not to take cold when cooling off after this treatment.

Plenty of Water.

Plenty of water, both inside and out, is the very best cosmetic. A cold sponge bath taken every morning to tone the skin and harden it and a hot or warm bath twice a week to remove waste matter will soon show good effects, and the result will be more decided if at least two quarts of water are drunk during the day. This may be either cool or hot as preferred, and it is better to take it between meals instead of with them, for too much fluid dilutes the saliva of the mouth and the gastric juices of the stomach.

WE WILL MAIL YOU A COPY OF

THE

CANADIAN COUNTRYMAN

(Canada's National Rural Weekly)

Every week from now until March 1st, 1913

For Twenty-five Cents

The CANADIAN COUNTRYMAN is a national weekly, devoted to agriculture as a grea business industry. It is the answer to a demand. The annual subscription price of this great Journal is $1,00, payable in advance.

The October 19th issue of The CANADIAN COUNTRYMAN is worth many times the whole subscriptien price to you. In this issue appear—

SHEEP—AND THE COST OF LIVING—A very instructive article, expounding the possibilities of lower prices for mutton, and more profitable farming, especially in the Maritime Provinces.

BUSINESS METHODS—IN EGGS AND POULTRY—Showing you how to make sure of the top prices for your eggs throughout the year.

THE THREE GIANT FAIRS OF EASTERN CANADA—An interesting and impressive study of the progress and development of the Eastern Canadian Exhibitions.

We want you to judge our paper on its merits and in order to give you a fair chance to see with your own eyes that it is everything we claim, we will send it to your home until March 1st, 1913, for 25c.

This offer will never be repeated.

Fill in and send this coupon, giving clearly your name and address, enclosing 25c.

AN ASTOUNDING OFFER

Here is a genuine bargain for all Music Lovers. A chance for all to learn the violin.

Secure at once our "LEADER" violin outfit. Every article is of excellent quality—so different from those which are usually included in low-price offers of this kind.

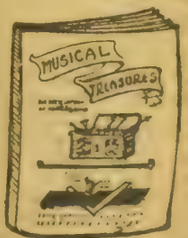
The violin is a Hopf model, beautifully polished and finished in rich nut-brown color shading to yellow. The tone of this instrument is of pleasing quality. The bow, too, is high class—in fact, every article is much superior.

Violin Beginners, Here's Your Chance! Get This Fine Outfit at a Low Figure.

You couldn't hope to get this collection from any dealer for less than five or six dollars. **Save $1.75.**

The outfit is complete, even to case, rosin, spare set of strings, instructor, finger chart, and scholarship certificate in the U.S. School of Music—one of the best of its kind. You don't even need a teacher. Anyone can learn who will follow these lessons.

This is our introductory offer and we cannot promise to keep it open indefinitely.



This Big Musical Encyclopedia
"Claxton's Musical Treasures" is Free.

It contains information that every person who plays, or who desires to play, a musical instrument should know. It also shows some astounding values in musical instruments and will prove a most welcome holiday shopping guide. The Violin Outfit described in this advertisement is only one of the marvelous values to be found in this big book of musical information.

A Delicious Dessert.

Cantaloupe filled with ice cream makes an attractive desert and tastes very good.

The melons are simply cleared of the seeds and the mebrane containing these. They are then set in the ice until they are thoroughly chilled. When you are ready to serve the dessert they are filled with the ice cream or other frozen sweet. Heap it in the center, instead of smoothing it down level with the edges of the melon.

Children's Idea of Life.

How little we older sojourners in this world realize the strangeness of it to our little comrades, who are just starting on their journey of life! We have grown so accustomed to its wonders and its ways, to its changes and its order, that we forget they were ever new to us and that there was a time when we, too, did not know what to expect.

When so many marvels met us on our way, why might there not be others also? Why not fairies and brownies, giants and ogres, talking wolves and bears that keep house comfortably with beds and chairs? (I remember one little girl, who on seeing the bears at the Central Park, cried out eagerly, "O, there's the middle-sized bear, but where's their chairs?") All these things seemed no more improbable than many others which we saw or heard of. Why shouldn't a pumpkin be made into a chariot as easily as into a pie? It resembles one no more than the other, to begin with.

And since, in some mysterious manner, a beautiful plant, bearing, after a time, lovely flowers, would appear where we had put into the ground a little hard, black seed, that gave no promise of life or beauty, why might there not be seeds that would produce plants bearing toys or cakes or candies? Or, if seeds would grow, why not other things that looked no less promising? One of my kindergarten children planted a marble, and waited long for it to come up, and I imagine that many of us can recall some such experience of our own.

How strange it seemed, too, that while water was to be found everywhere all ready for use we had to go to the cow for milk! Why were there not springs and rivers of milk, as well as of water? I remember thinking that this must have been the case of Canaan,—that "land flowing with milk and honey." It was all unaccountable, and anything might turn up.

It all seems far away now—we have grown used to the world, and know what to expect—to a certain extent, at any rate—but we cannot get a child's point of view at all, nor understand how to help him, unless we can realize, either from our own experience, or from observation of children, these early impressions.

For instance, we know that we can't fly, and we have ceased to expect to, but doesn't almost every child try to fly? When my nephew was two and a half years old he had been watching the birds one day, and presently he said to me, "I'm going to fly up in a tree." He stood under the tree and jumped up and down for some time, and finally remarked in surprise, "I can't fly!"

I said, "You have no wings." Whereupon he turned his head, trying to look at his back, and asked, "Where are my wings?"

At another time, on seeing the half-moon, he inquired, "Where is the other half of the moon and why don't they mend it on?" We, who are so accustomed to the waxing and waning of the moon, do we ever think how extraordinary it must appear to children, and to savages, who do not understand the reason for these changes in appearance? Is it any wonder that so many stories and myths have grown up, in explanation of this mystery?

The same child asked at Christmas time, about a year later, "How does our Heavenly Father make all the toys?" Being a country child, he was accustomed to see natural objects—as trees, rocks and streams—and had been told that God made them, and though he knew that and his clothes were made by people, he probably supposed that all the things which appeared "ready made" in his world were made directly by God.

On the other hand, a city child who sees little of nature will often refer natural processes to human agency. I saw this illustrated a short time ago, while talking with some things, such as puddings, bread some tiny city children. They were talking about the snow, and when I asked them what became of the snow in summer they insisted that "it was all shoveled up and dumped in the river." When we brought in some snow, and they saw it turn into water, their surprise was great!

Indeed, the melting of ice or snow is generally a great surprise to little children. How often a snowball is brought into the house "to keep," and vainly sought for later. I remember a little girl, in a friend's kindergarten, whose lunch could not be found. Jessie was in tears, and the teacher searched everywhere, and finally asked, "What did you bring, dear?" "A piece of ice," answered Jessie.

Sometimes this ignorance of the world has disastrous effects and not seldom what we call "mischief" is really want of knowledge. I remember that one of my brothers tried to use the door mat as a boat (happily only in the basin of a little fountain) and was astonished to find himself taking a bath, instead of a sail.

I feel strongly that in dealing with children we should keep in mind their ignorance of the world—of the laws of nature and the customs of grown-up people, and should overlook, or treat leniently, a good many things that are trying and perplexing to us. If we should suddenly find ourselves in an absolutely new and strange country, where we did not know the laws and customs and understood the language very imperfectly, I think we should be apt to commit a good many blunders, and be laughed at or scolded for them. And yet the strangest foreign country could hardly be as stramge to us as the whole world is to little children.

How can we best help them to live and learn? It is evident that they must learn what to expect—must learn that this world is really a word of order—that effect follows cause, and that things do not happen arbitrarily. They will learn much of this through their own experimenting, if we allow them freedom enough, and do not interfere unnecessarily, only guarding and guiding them in their researches, and trying to answer their questions clearly and patiently. And in all that we do, let us be very careful not to dull their interest, or make the world seem cold and hard to them.

The world is full of wonders and of beauty and a word of law and order is not cold and dull, but deeply interesting—far more interesting really than the fancy and caprice of a fairy tale. And though the crude ideas of God's "making" the world and all things in it, as a man might mold images out of clay, must gradually be changed to a knowledge of the slow processes whereby all things have come into being, yet he need not lose from his thougnt the idea of the Heavenly Father, who has ever been in his universe and is still working in it, making it a universe of law and order where we can live and work with him.

FASHIONS HIGHEST DECREE

IS PRONOUNCED IN THIS ELEGANT MISSES SUIT

$15.00 PREPAID

E. 2. Z. 1. EXTREMELY STYLISH MISSES' SUITS of good quality all wool cheviot serge, give a slender effect, being cut on straight lines. Collar is trimmed with a bright touch of red and black satin. Washing Enamel Paint.

The beauty of the white paint and enamel that are so deservedly popular is dependent upon spotlessness. Now there are various things that will remove spots therefrom, but the following method will, according to Ladies' World, leave the paint almost better than when new. It works like a charm upon painted or enameled metal beds, too, and doubtless upon numerous other things.

Have ready two white cheese-cloth cloths. Put them into hot water and then wring out until they are no longer wet, but merely well dampened. Now upon one of them rub one of the excellent white soaps that are upon the market. The result will be a heavy cream, but not a lather. this upon the soiled places until the latter disappears, which will be immediately unless the case be a very bad one; then wipe off with the other cloth. The result will be entirely satisfactory. The secret of success lies in the cream that is not a lather, in the mildness of the soap used, and in the dampness instead of the wetness of the white cloths.

Cream of Vegetables.

Cut one turnip, a carrot and a potato into thin slices; add to them a few celery tops, a bay leaf, a cupful of tomato if you have it, and two quarts of water in which meat has been boiled. Simmer gently for one hour; press through a very fine sieve, return the mixture to the fire and add one tablespoonful of suet rubbed with two tablespoonfuls of flour. Stir until it reaches the boiling point, add a grated onion, a teaspoonful of salt, and a saltspoonful of pepper. Serve with croutons.

Economical Wrinkles.

Here are a few homely discoveries some original, and some the result of modifying the hints of others, which may be new to some readers.

Cold left-over oatmeal may be added to meal and to flour gems, also it may take the place of flour in cornbread and brown bread, and it much improves all these dishes. Soak it up in the mixing and get all the lumps out of it with the hand. Dried doughnuts may be boiled in a little hot water to soften them, and added also to brown bread or stale cake, bread or crackers. I have put a saucerful of left-over pudding into it, also a spoonful or two of left-over squash or pumpkin. Of course, these are not all used at once, but any combination of these odds and ends which occur may be so utilized.

A saucer of apple sauce, dried peach sauce, or stewed prunes makes a pleasing addition to cake. Cut the peaches into small pieces and stone the prunes.

Use the cupful of left-over cocoa as the basis of a corn starch pudding, by adding a little more cocoa, milk and the usual ingredients.

The surplus fat sometimes found in a fowl may be ground up in the meat chopper and take the place af pork or butter in the dressing. Or it may be "tried out" and used as shortening for special cake, the spices concealing the flavor of the chicken oil.

Cut hot cake with a Cristy knife, and it will not fall.

Use a small brush to grease tins. It saves grease and time and the is more evenly distributed.

Cottage pudding is more attractive when baked in muffin tins. Set the pan on a cloth wrung out of cold water immediately after removing from the oven and in a few minutes the cakes will come out unbroken.

It takes less cream to serve whipped cream on a dessert than to use the plain cream at the table.

Sift squash, pumpkin and dried apples for pies through the potato ricer it is a great saver of time.

When butter is high and there is no dripping at hand, cold potatoes may be warmed up in lard, if an onion cut in small pieces be first fried in the fat and the potatoes added. The onion conceals the "lardy" taste.

If sausages are baked in a pan in the open, and are pricked in several places with a fork, they will be much more digestible and the extra fat which comes from them gives a delightful flavor to warmed up potatoes.

When frying pork, place the slices in a pan in a hot oven and they will not ouly fry to a dainty crispness, but much more fat will fry out and the top of the stove escapes the spatters of g.

When there is hardly enough macaroni for a dish, it can be pieced out very acceptably with rice.

A delicious pudding is composed of alternate layers of stale cake and stewed dried fruit, such as peaches, apricots or raisins. After the dish is filled with the layers pour over the contents sufficient thin, uncooked custard to almost cover, and bake.

A small 10c-store convenience is a wall-paper scraper, which is excellent for scraping the flour-boar scraping cake tins, digging into corners, and a variety of other things.

Country housewives who dry apples should save the skins and cores of the apples, stew them, and use the juice for jelly. If you do not wish to make it all up into jelly at the time, can the juice up hot, like any fruit, and make the jelly at your leisure. Thus you save the juice and avoid the labor of preparing other fruit for jelly-making.—Exchange. 6

The Farmer's House.

The farmer's house is a very great factor in the life of the farmer, and even more in the life of his family. The neglect of the farm house has doubtless more than once driven the children from the farm to see more attractives homes in the cities.

Pride counts with young children, especially with those of spirit and ambition. Today more than ever before in the history of the world, the children have high ideals, for they have become accustomed to reading books. In these books they find the ideal homes and beautiful houses. If the farm house in which they live is unpainted and dropping to pieces, it will fall so far below their ideals that they will be very uncomfortable when their friends come to see them and will look forward to the time when they can go out from the old house forever.

This is a very undesirable frame of mind in which to have the children of the farm home. It deprives them of that inspiration they should have. It is far better ito reverse things and make the farm house and the farm home so attractive that the children will be proud of them, whoever comes to see them.

The farmer can well afford to pay a little less attention to some other part of the farm and give the house the attention it should have. Make it a thing of beauty and a joy forever. On the farm such work as painting is generally done by the men that inhabit the house. Thus, putting on a new coat of paint is less expensive than it is in the cities, where labor has to be paid for at a high price.

A farm house should be thoroughly painted every two or three years to protect it from the weather and make it look fresh and bright. Every year certain parts should receive coats of paint—such parts as the porch floors, steps and window sills. These gre more exposed to the rain, sun and wind that most other portions, and if not frequently repainted, go to pieces rapidly.

The sides of the house that are most exposed to the sun will crack and begin to deteriorate more quickly than the other sides and thus should be kept watch of to prevent the woodwork getting into a condition where it will be difficult to cover up the deterioration.

The arrangement and equipment of the farm house are things that should be studied in the light of modern art and modern ideas of comfort. It is surprising how much a little money will do in improving conditions in the house. Today there are farm houses as well equpped as are the houses of the well-to-do people in the cities.

Running water in the kitchen and the bath room, a sewer system, furnace heat, a telephone, and even electric lights are possible in a great number of localities. These all cost money, but money must be expended in the country as well as in the cities if the people there are to have attractive homes.

Washing White Serge.

Shave one large cake of white soap into a pail of hot water and allow it to stand over night. The following morning fill a tub about one-quarter full of warm (not hot) water, and pour the contents of the pail into it and mix thoroughly. Now lay your skirt, making sure that the water covers every part of it. Allow it to remain three hours, and then have ready three pails of lukewarm water. Take the skirt up by the waist binding, allow it to drip a moment, and then plunge it into the pail of clear water. Souse up and down several times, always holding by the binding. Put through three or four waters just this same way, never wringing it. Then, when in the last water, carry the pail out-of-doors to your clothes line and hang the skirt up by the binding. The water will soon run out of it, and if it shrinks any it will shrink evenly. Watch carefully, and when almost dry take it in and press it, and you will be surprised at the success of your undertaking.

What We're Worth.

The analysis of the human body that has recently been published in an Indian paper must give us satisfaction. It reads :

An average man of 150 pounds contains the constituents found in 1,200 eggs. There is enough gas in him to fill a gasometer of 3,649 cubic feet. He contains enough iron to make four tenpenny nails. His fat would make seventy-five candles and a good-sized cake of soap. His phosphate contents would make 8,064 boxes of matches. There is enough hydrogen in him in combination to fill a balloon. The remaining constituents would yield, if utilized, six teaspoonfuls of salt, a bowl of sugar, and ten gallons of water.

Few of us, probably, imagined that our intrinsic value was so great.

FREE-MAGNIFICENT PHONOGRAPH-FREE

Here is the most stupendous offer ever made by any reliable firm. We will give away, absolutely free of cost, 1,000 of these magnificent imported phonographs, complete with your choice of thousands of the newest and most popular records.

This is the Chance of a Lifetime. Grasp It Now.

This magnificent phonograph will talk, sing songs, play orchestra or band music, tell funny stories and in fact **DO EVERYTHING YOU WOULD EXPECT OF A $50.00 MACHINE.** You want a phonograph in your home, but don't throw away your money by paying $25 to $50.00 to get one, when you can get this magnificent instrument absolutely free for just a few minutes easy work.

Now all we ask you to do is just send us your name and address to day, and let us send you by return of mail, all charges paid, just 16 of our famous Gold Dollar Concentrated Flavoring Extracts to sell for us among your friends at only 25c. each. These wonder flavors are the greatest improvement on ordinary extracts ever achieved. Handsomely put up in collapsible tubes, all the best flavors—Vanilla, Lemon, Orange, Raspberry, Strawberry, Almond and 20 others. Four drops of Gold Dollar Flavors equals a teaspoonful of ordinary extracts.

Every tube is guaranteed to equal five regular 15c. bottles of regular flavorings. Every housekeeper you show them to wants to buy three or four tubes of the different flavors we send, and every lady who buys a tube can receive free from us a magnificent edition of a new cook book worth 25c. You cannot fail to sell them all in a few minutes. Our agents are making lots of tubes daily.

SEND NO MONEY. We trust you with the extract until sold. As soon as our money only $4.00 is returned to us you will receive the magnificent phonograph, all complete with record absolutely free. **IT'S A WONDERFUL MACHINE.**

We are spending thousands of dollars to introduce these famous extracts into every household, and when we say we will give you this grand phonograph, we will do so. Address to-day

Storage of Squash.

The precautions to be observed in storing vegetables in order to have the least loss are not well understood by vegetable growers generally. It is necessary to know that the losses are apt to be either from loss of moisture or from decay before we are able to decide whether or not it would be profitable to hold vegetables for higher prices on the winter market. With a view to answering some of these questions, Prof. W. Stewart, of the Vermont Experimental Station, has carried on some experiments with Hubbard squash, holding them till midwinter.

In these experiments a ton of squash weighed as taken from the field, was stored on October 3, in a dry and medium warm (50 to 60 degrees F.) room. On December 4 the squash weighed 1,810 pounds, a moisture loss for two months of 9.5 per cent. On January 4 they weighed 1,657 pounds (sound 1,622, decayed 35), a moisture loss of 8.5 per cent., and a decay loss of 1.8 per cent. On February 3, four months from the harvest, the sound squash weighed 1,488 pounds and the decayed 61 pounds, a moisture loss of 4.5 per cent., and the decay loss of 3 per cent. The total moisture loss during four months was 20.8 per cent. and that from decay 4.8 per cent.; total, 25.6 per cent.

When the squash were put in storage they were wholesaling at one cent a pound late in October at 1.5 cents, two cents late in December, and in January, owing to unusual scarcity, at 2.5 to three cents. At the conclusion of the trial the 1,448 pounds were sold at $53, an average of over 3½ cents a pound, the net gain by storage being $33 per ton. Market conditions, however, were very unusual. The common price at harvest is $15 to $20 a ton, and does not materially increase until January ($30 to $40), while during Febuary and March they advance to $50. Hence even under ordinary conhitions the increase in price amply offsets losses from moisture, decay and cost of storage, and leaves a handsome profit.

The conditions tending to minimize losses in storage Prof. Stewart states to be:

1. The squash should be well manured before harvest.
2. They should be cut or carefully broken from the vine, leaving the stem attached to the squash.
3. If possible they should be placed in small piles to ripen and harden up for two or three days before hauling from the field.
4. They should be hauled in a spring wagon, the box of which is lined with burlap or other material, to prevent bruising.
5. The storage room should be dry and moderately warm, at least for the first two weeks, to harden up the shells, after which a lower temperature, provided the room is dry, may be maintained.
6. Finally, squash from harvest to sale should be handled as one would handle eggs. Broken stems and bruised skin are sure to cause decay.

In general, Prof. Stuart concludes that squashes properly grown and handled may be held in storage till mid-winter or later.

A Fruitful Tree.

Mr. John Tobin of Kentville has what many consider the most productive apple tree in the Valley. It is a spy and in 1910 it produced 15½ barrels. In 1911 it again gave Mr. Tobin 15 bbls. and this year it beat its former record by producing 18½ barrels. It is very unusual to get such big crops three years in succession. If any one can give a better record we would be pleased to publish it,—The Advertiser, Kentville, N. S.

Lifting a Pail of Milk 3 Times as high as the Rocky Mountains

CONSIDER the importance of the LOW supply can of the Standard Cream Separator. Over a foot lower than supply cans of ordinary separators. Assuming that your wife skims 20 pails a day, it means that, in 20 years, the STANDARD will save her a difference equal to lifting a pail of milk 3 times as high as the loftiest peak in the Rocky Mountains. It will save her the same difference again in lowering the empty pail.

Standard

YOU wouldn't ask your wife to climb up a Rocky Mountain peak. Why ask her to lift a pail of milk three times as high? That's what makers of ordinary separators ask her to do—but which you can prevent by giving her the STANDARD. The STANDARD has other conveniences that make it the "world's greatest separator." They are told about in our booklet. Write for a copy. We challenge other makers to show a single good point we haven't incorporated in the STANDARD. But there are some new and exclusive features in the STANDARD that you'll find in no other separator.

The "Standard" 12

Request Tariff Proteciion or Renewal of Bounties.

Representatives of all the steel interests met the ministers of the Government at Ottawa, on Friday, October 25th, asking increased tariff protection on steel products or if the government will not immediately increase the tariff, they want a temporary renewal of the bounties pending a permanent revision of the tariff We understand that the government have only promised consideration, and will again discuss the matter with them, before the season opens in November. Now the steel interests will resort to every means within their power to either get the government to pay them out of the public treasury, a fixed amount on every ton of steel they manufacture, or place higher duty on steel products, which will give them the privilege of directly taxing every user of steel in Canada.

For the past quarter of a century, the steel interests have been given enormous sums out of the public treasury, and on the strength of these immense sums, it was possible to place a large percentage of water in their stock, and still pay a dividend. Now, when the bounties are cut off, it is trouble some to show a dividend on the watered stock, and naturally they look to the government to give them the privilege of specially taxing the public in order that their stocks will hold the old market value. Are you willing to be specially taxed for this purpose? Early this present year the Sarnia Fence Company circulated petitions among the farmers, in order that they might place before the government their feelings on the matter of renewal of the bounties, or granting further protection to the steel interests, and the result was, so much objection was raised, that the steel interests were obliged to let the matter rest for a year, and now they are renewing their demands. The main argument of the steel interests before the government, is that they are not receiving as much protection through the tariff, as other lines, and they feel they are being discriminated against in not having the privilege of bleeding the public for as large a percentage as other manufacturers. They are seeking legislation which will place all steel products in their control. If they can by any methods lead the members of the government to believe through a contortion of figures that they need further protection, they will get it. On the other hand, if the farmers of Canada stand together irrespective of party politics, and refuse to spoon feed the steel interests longer, the government will listen, if you go after the matter through your member, who is your representative at Ottawa and write him personally, and tell him you will expect him to oppose any renewal of the bounties, also any further protection in the tariff, particularly the giving of a bounty on wire rods, or any change in the free admission of galvanized wire for fence purposes will be resented by you. Protests of this nature will be effective, and it is up to you to do it today, then watch the result.

When the late government placed plain galvanized wire for farm fencing on the free list, it was meant as a special concession to the farmer. He (the farmer) however, was prevented from reaping any benefit from this concession through a pool arrangement of the Fence Manufactururers. Through the policy of the Sarnia Fence Company the farmer has had a taste of what was intended for him. Are you going to sit idly by, and see the steel interests through legislation deprive you of this concession when you have the remedy in your own hands, prompt action and strong protest will do it.—The Sarnia Fence Co. Ltd.

Is your husband cross? An irritable, fault finding disposition is often due to a disordered stomach. A man with good digestion is nearly always good natured. A great many have been permanently cured of stomach trouble by taking Chamberlain's Tablets. For sale by all dealers.

Had a Weak Heart.

Doctored For Three Years Without Any Benefit.

Through one cause or another a large majority of people are troubled, more or less, with some form of heart trouble.

Little attention is paid to the slight weakness, but when it starts to beat irregularly, and every once in a while, pain seems to shoot through it, then it causes great anxiety and alarm.

Milburn's Heart and Nerve Pills will give prompt and permanent relief to all those suffering from any weakness of the heart or nerves.

Mrs. M. Shea, 193 Holland Ave., Ottawa, Ont., writes:—"I write you these lines to let you know that I have used Milburn's Heart and Nerve Pills. After doctoring for the last three years with all kinds of medicines and pills for weak heart, I heard of your Heart and Nerve Pills, so thinking I had never used anything that did me so much good, I kept on using them, and I had only used four boxes, when I was perfectly cured."

Price, 50 cents per box, 3 boxes for $1.25 at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THIS handy farm wagon is built low (which saves time and labor loading and unloading) and will carry the heaviest load—anywhere a horse can travel. And because it never needs repairing, it's the most economical wagon on the market.

T-A Handy Farm Wagons and Wide Tire Steel Wheels

Equip your old wagons with T-A Wide-Tire Steel Wheels and they'll be just as good as new. And besides they'll carry 25 to 50 per cent. heavier loads.

How to Dress Calves.

Calves from three to six weeks old, and weighing about one hundred pounds, or say from eighty to one hundred and twenty pounds are the most desirable weights for shipment. The head should be cut out, so as to leave the hide of the head on the skin. The legs should be cut off at the knee joint. The entrails should all be removed, excepting the kidneys; the liver, lights and heart should be taken out. Cut the carcass open from the neck through the entire length—from head to bumget. If this is done they are not so apt to spoil during hot weather. Many a fine carcass has spoiled in hot weather because of not being cut open. Don't wash the carcass out with water, but wipe out with a dry cloth. Don't ship until the animal heat is entirely out of the body and never tie the carcass up in a bag, as this keeps the air from circulating, and makes the meat more liable to become tainted.

It is very essential that the directions for dressing calves be followed, especially in regard to letting the calves cool off properly before shipping in hot weather, as hundreds of calves are received in bad order and sold for not much more than charges, and some do not bring freight. Numerous carcasses are also condemned by the health officers. They should hang up six to eight hours or over night in an airy place to properly cool off before shipping.

Calves under fifty pounds should not be shipped and are liable to be condemned by the health officers as being unfit for food. Merchants, too, are liable to be fined, if found selling these slunks, for violation of the law. Very heavy calves, such as have been fed on buttermilk, never sell well in our market—they are neither veal nor beef.—Live Stock Journal.

The Faithful Dairy Cow.

The dairy cow, aside from her commercial importance to tne farm is a gecessity for the home. Only those who are deprived of fresh milk, choice butter and buttermilk for baking and for drinking can realize the importance of the dairy cow. Cold or hot wet or dry, early or late, the faithful old cow is ready to tender her services in supplying food for the family. She is a necessity; her services can not be dispensed with. There is no more faithful, no more economical, no more desirable animal than the dairy cow, and she should be well cared for and her services more appreciated.

Sprouting Grain for Fowls.

Where it is possible, a winter crop should be planted to furnish green food for the fowls. It does not take a large area to furnish green food for a small flock and usually plenty of space may be found for this purpose. But where one has only a city lot and a green crop is out of the question, arrangements should be made to sprout oats, rye, wheat or barley. If no other space is available, a box of soil will suffice. The box may be filled with rich garden loam if the seeds are to remain long enough for the plants to grow; if the grain is to be fed as soon as the seeds sprout, a box of sand is sufficient. The box may be set in the cellar or in the kitchen near the stove in very cold weather.

EVEN the barrel label invites your *confidence.*

It says "you must be satisfied, or your dealer returns your money."

That's because this flour yields the best quality and the utmost quantity of bread, light, white loaves, flaky pastry.

"There could be no better medicine than Chamberlain's Cough Remedy. My children were all sick with whooping cough. One of them was in bed, had a high fever and was coughing up blood. Our doctor gave them Chamberlain's Cough Remedy and the first dose eased them, and three bottles cured them," says Mrs. R. A. Donaldson, of Lexington, Miss. Lor sale by all dealers.

Management of the Alfalfa Field.

Information for the management of the alfalfa field after it has been seeded is given by O. O. Churchill, Agronomist at the Oklahoma Experiment Station in the following condensed form:

When weather conditions are very unfavorable the young plants may die. When this occurs reseed on the same land the following spring or fall, as the case may be. Do not let one unsuccessful trial discourage you.

If the leaves turn yellow or rust badly, or if severely attacked by insects, or if weeds grow rank and shade the young plants, it should be clipped.

Clip whenever the plant begins to blossom even during the first year.

Use a spring-tooth harrow, a renovator or a disc harrow in the spring just before a growth starts or just after a crop is removed when the soil becomes hard and compact or very weedy. When a disc is used set nearly straight and weight down so that it will run the desired depth.

Manure will always give good returns and especially on poor land and when the plants are doing poorly.

Do not pasture late in the fall or during the winter. Most alfalfa growers claim better results when the crop is grown for hay than when the field is pastured.

Do not pasture at all during the first three years, or until the alfalfa becomes thoroughly established.

The alfalfa crop should be cut whenever five or 10 per cent. of the plants are in blossom. A better method of telling when to mow is to watch the base of the plant and cut whenever the little buds show that a new growth is started.

Allow the plants to wilt but not to become too dry in the swath, then rake and cure in the window or in bunches.

Stack or put in the barn when cured, which will be about one week after mowing, depending upon the weather conditions.

When a seed crop is desired, the first crop should be removed and then the plants allowed to go to seed. The production of seed depends very largely upon the weather conditions and upon the thickness of the plants. The seed crop may be mowed and raked the same as the hay crop, and most of the seed can be saved by an ordinary threshing machine.

Feed this valuable hay to good stock; you cannot afford to sell it.

Home Cured Bacon.

First, if the weather is freezing, salt down at once; if not, spread out and salt next morning; rub well; use 10 to 12 pounds of salt to the hundred pounds of pork. Wrap up so that the flies will not get to the meat. Look at two or three times, see that your salt don't crust on the meat. Sometimes it is necessary to add a little more salt in warm wet weather. Get it properly salted, the rest is easy.

When the meat begins to get slick on the skin side take up and wash in strong borax water, hot as you can bear to wash in; then lay on scaffold Take pulverized borax and dust the flesh side and edges.

Dust the smokehouse good with borax and hang your meat. I never take it down only as I use it.

This is the best way that I have ever found to keep meat. Neither bugs nor worms infest it; it does not get strong.

RAW FURS

Are you a trapper? Are you a dealer? Are you seeking a reliable firm to ship to? Many thousands of shippers say we give best returns, good reasons—we pay as we quote, give a square grade and send your money as quick as the return mail can bring it to you. We post you reliably.

New Vitality For Men

USE THE

Free Coupon

Vitality gives you the manly courage to protect those depending upon you, as portrayed in the picture. No matter what thoughtless action or early indiscretion may have sapped your strength, vitality restores it to you. It makes you over into a strong, vital, manly man, without an ache, pain or weakness. Vitality puts the real VIGOR OF YOUTH into your blood; no matter how nervous or debilitated you may be, it puts the sunshine of vigorous manhood into your life; I make you feel young and keep you feeling young, without the use of drugs, without the necessity of dieting, without one bit of change in your present mode of living, except, of course, dissipation must cease. Just lead a manly life and use my HEALTH BELT; everything else will come. My HEALTH BELT, worn at night, pours a great, soft stream of VITAL STRENGTH into your blood, nerves and organs during all the hours you sleep; in one night it takes the kink, pain or weakness out of your back, ere long friends will be saying: "How well you look," and you are answering: "Never felt better in my life!" Your eyes will sparkle with health; you will have that pleasing influence to fascinate and control which comes to all full-blooded, strong, vital, manly men. Thousands upon thousands are now using my Health Belt all over the world. With special attachments it cures rheumatism, kidney, bladder, stomach disorders, etc.

Let Me Send You This Book Free....

Here is my latest illustrated book: "Health In Nature," containing a fund of private information relating to weakness of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely no obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

THE T. EATON Co LIMITED

TORONTO - CANADA

Things Equal to the Same Thing are Equal to Each Other.

It does not require the mind of a geometrical student to understand the old axiom that, "Things equal to the same thing are equal to each other."

Now let us study this old axiom as applied to plant life, and see what great lesson we can learn from it. It will be somewhat of an experiment. We will take a boy at an age where he can do some thinking and some reasoning for himself. We will place him by the side of a stalk of corn; tell him that he is going to be left alone and to study this stalk of corn; that this stalk of corn was made by the same creator that made him; and that we desire him to study out the various parts and the functions of each; that we wish him to learn the purpose for which each part was created and any other special characteristic.

The first thing that attracts the attention of the boy will be the long green blades. He thinks they are beautiful and soon learns that the deep green color is the sign of life. He examines the construction of these blades, and is much attracted by the little gutter-like ribs. He now takes a glass of water, empties it over these blades, and watches the water go splashing down in this little gutter, and then finally is distributed around the roots at the base. At once he understanhs that every little gutter will lead the water and deposit it at the same point. It is simple, yet interesting. He feels that the one who made the plant must have studied it out well before making it, and he himself does not see where if it were left to him that he could improve on its construction.

But just as he was watching the water run down around the rootlets, his attention is attracted at the base in addition to the regular root system, to a number of large roots that are shooting forth several inches above the ground, yet reaching downward, and some already have run their noses into the soil. For a moment he wonders if the plant didn't make a mistake and start these out too high above the ground. The boy is puzzled over this seemingly new discovery. He sits down and tries to study out this problem. Just about this time a great puff of wind comes; the stalk sways and yields to the wind; it is bent and he fears that it is ruined. The wind ceases and almost instantly the stalk arights itself, and is now in the same upright position. The blowing of the wind has aided him materially in solving this mystery. He saw the wind twist the stalk, and felt sure that had they not been there the stalk would have been blown down, and being of such heavy weight it could never have righted itself. The purpose of these large roots he has learned is to brace the plant. He understands why it was that they were put out above the ground on a similar plan to what he had seen his father brace some fence posts in his yard. He understands why it is that they are not needed on the baby plant. He thinks that it was a great plan, and the One who made certainly thought it out, as he himself would have done.

In like manner he takes each part of the plant and studies out or reasons out for himself the function of each plant and always comes to the right conclusion. Little by little he sees every part of the plant and thinks what he would have made it the same way had the work been left to him.

While studying the corn plant his attention is attracted by a yellow flower nearby. It is a dandelion. Some of these which he has plucked have stretched out their heads high in the air above their brother yellow flowers, and assumed the shape of little worlds and bubbles. He holds this little world near his face and the force of his breathing destroys the little world discovered; it burst to pieces, and each piece rose into the air like an airship and floated away. He is now much interested, but more amused. He follows one of those pieces that is floating near tne earth and it finally settles to the ground; He picks it up, holds it closer to his eye. He discovers that it is constructed on the same plan as the parachute that he has been reading about. But he finds that instead of carrying a person or pigmy that it has a seed. He watches another parachute light and sees that the seed strikes the ground first, the point really piercing the earth. It remains where it has lodged. He begins to think just why this should be so. He has seen the entire balloon—collection of seeds, scatter in all directions. Same have landed nearby, others have flown entirely out of sight. Then he reasons and arrives at the conclusion that this is the plan for scattering the seed. It is the way the plant was made for getting scattered and planted in other fields.

The boy then learns that another plant will grow from each seed. That each parachute carried one of these seeds and deposited it far beyond the old home where it was raised. Again he has thought out why the Creator made the parachute for each seed. That they would be scattered and when they came up next spring they would not be crowded for room. He thinks it is a fine arrangement and believes that he himself would have made it the same way had it been left for him to do.

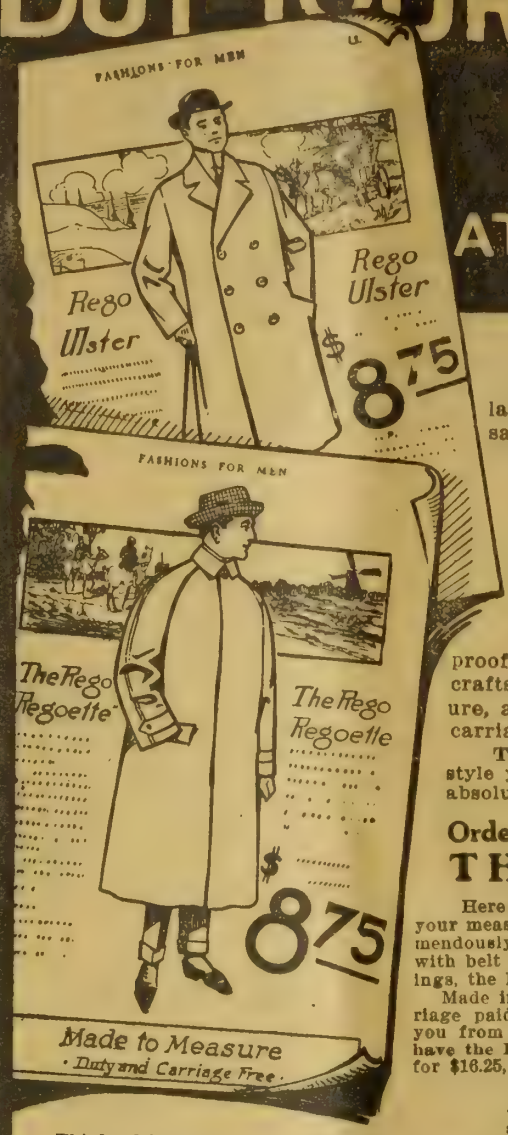
The child thus without any help thinks the same thoughts that his Creator thought when making these plants. His mind has traveled naturally in the same channel. He believes that he would have made them in the same way. In like manner every part of every plant can and has been worked out. Without any extraneous help or influence, but naturally, the child's mind has followed that of the Creator of all things.

The product of his brain is the identical thoughts of his maker. "Things equal to the same thing are equal to each other." Is not then the child created in the image of the Creator of all things? It is incontrovertable.

The question then naturally arises, is it possible then for a naturalist to become so deeply interested in the things about him that he thinks nothing of the higher life? Is it possible for a student of nature to think of all these wonderful creations without thinking something about his own self? Is it possible for him to go down to the grave an infidel? Although he has studied plant life in the construction of plant life, has he not discovered the fact that in like manner the Creator made him for a purpose? Each fact that a student of nature learns should spur him on to something higher. It is impossible for him to admire creations, without having greater admiration for the creator. It is unnatural for one to love a creature, without loving more its creator.

When a child becomes interested in things made by the Creator, a multitude of deepest thoughts are certain to follow. He begins to be interested in his own body. He studies each part of his body more interestingly than he has studied the various parts of different plants. He discovers, along the way, that each part of his body was made for a purpose, and sees the wisdom in their construction.

BUY YOUR FALL & WINTER CLOTHES AT ENGLISH PRICES



London Styles Lead the World

The **REGOETTE RAINCOAT** is one of the most popular waterproof cloth coats worn in England to-day. Thousands have been sold—many to the best-dressed men in London.

For smart fall wear the Regoette is a stylish walking coat, as well as a perfect waterproof. It looks well, and wears well, and will be admired in any company.

Owing to our enormous tailoring business—30 branches in London alone—we are able to buy the best materials at the lowest prices. That makes it possible for us to make this offer to Canadian men:—**OUR REGOETTE RAINCOATS**, guaranteed absolutely waterproof, cut to Canadian requirements, made by expert English craftsmen, from best English materials. Made to your measure, and according to New York or London styles, for **$8.75**, carriage and duty paid.

The Regoette is made in several styles. You may choose the style you prefer, and each style carries our guarantee that it is absolutely waterproof, and cut to fit your measure, or money back.

Order Your Winter Overcoat Now!

THE TWO FOR $16.25

Here is a heavy Double-breasted Rego Ulster, made to your measure by London tailors, and which has become tremendously popular. It is smart and elegant in appearance, with belt behind. Your choice of plain Italian or fleece linings, the latter something entirely new and very warm.

Made in England, the price is low—$8.75—duty and carriage paid. The same coat made in Canada would cost you from twice to three times the money. **And you can have the REGO ULSTER and the REGOETTE RAINCOAT for $16.25, carriage and duty paid.**

Think of it—these two coats—English, made to Canadian requirements, entirely to customers' measure, of the best old country materials—**$16.25 for the two.** We pay all carriage and duty charges. We make this offer to get in touch with more Canadian customers.

Send for our free magazine, "Fashions for Men"—the only men's fashion journal published. Tells all the latest fads and fashions in clothes and men's furnishings. We will also send free samples of cloths used in the Ulsters and "Regoette" Raincoats and pattern samples of fall and winter suits, free self-measurement chart, tape, etc. You will then be able to choose styles, materials, etc.

Preserve individuality in your attire. Get your clothing to your own measure.

THE REGO CLOTHIERS, LIMITED, 122 Cheapside, London, E.C.

WIRE FENCE PRICES

HAVE ADVANCED

The SARNIA FENCE COMPANY, Limited

SARNIA, ONTARIO.

ARE you aware of the fact that the price at which we are selling the finished woven wire fence, is less than the actual cost of the wire on the the open market today? Are you aware that the only thing between the farmer, and higher prices for fence, is the contract which we, The Sarnia Fence Company, hold with our wire makers, to furnish us with wire at an agreed price for a certain period? When the amount of wire which we have contracted for is used up, we must pay more for our wire, and we in turn must increase our price of fence.

Until The Sarnia Fence Company's direct to the farmer policy became the dominant factor in the Canadian field, the price of fence has always been advanced as soon as the wire market would permit it, and the farmer had no option, but to pay the advance.

Now, we are going to sell at our old prices, as long as our contract will permit, and we urge every farmer to take advantage of our offer, and purchase his fence, at the earliest date possible. Orders will be filled in the order in which they are received, and the farmer who gets his order in first, is surer of getting his fence at the low price, than if he waited until the usual time, and then found that others had got in ahead of him, and he was left to pay the higher price.

On account of our offering to continue our extremely low prices to the farmer, in the face of advanced prices all around us, it is likely that the demands made upon us will be so great, that our supply will be taken up long before the fence season opens, we therefore cannot urge upon you too strongly the necessity of you placing your order, at the earliest date possible. Send your remittance with your order, and we will guarantee to deliver at the prices below, as long as our stock will permit. State in your order, whether you wish your fence shipped at once or held, and shipped at a later date.

The Sarnia Fence Company's direct to the farmer policy has saved the farmers of Canada, many thousands of dollars. We shipped over seven hundred car loads of ROYAL fence during 1912. We number our pleased customers by the hundreds of thousands. The above offer is another proof of our loyalty to the farmer. We propose to protect him to the utmost of our ability. Our well known guarantee YOUR MONEY BACK, AND WE PAY FREIGHT BOTH WAYS, IF DISSATISFIED, holds good on every bale of Royal Fence. READ THE PRICES, GET YOUR ORDER IN TODAY SAVE FOR YOURSELF, WHAT HAS NEVER BEEN OFFERED TO THE FARMER BEFORE.

5-40-0 Has 5 line wires. 40 in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 10, 10, 10. 10. Price per rod	17c

7-40-0 Has 7 line wires, 40 in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 5, 6, 6, 7 1-2, 8 1-2. Price per rod	21c
8-34 Has 8 line wires. 34 in. high, 12 stays to the rod. all No. 9 hard steel wire. Spacing 3. 3 1-4, 3 1-2, 4 3-4. 5 1-2, 6, 8. Price per rod	25c
8-40 Has 8 line wires, 40 in. high, 12 stays to the rod. all No. 9 hard steel wire. Spacing 3, 4, 5, 6, 7, 7, 8. Price per rod	26c
7-48-0 Has 7 line wires, 48 in. high, 9 stays to the rod, all No. 9 hard steel wire. Spacing 5, 6, 7, 9, 10, 11. Price per rod	22c
8-48 Has 8 line wires, 48 in. high, 12 stays to the rod, all No, 9 hard steel wire. Spacing 4, 5, 6, 7, 8, 9, 9. Price per rod	27c
9-48-0 Has 9 line wires, 48 in. high, 9 stays to the rod, all No. 9 hard steel wire. Spacing 3, 4, 5, 5, 6, 8, 8, 9. Price per rod	27c
9-48 Same as 9-48-0, with 12 stays to the rod. Price per rod	29c
10-50 10 line wires, 50 in. high, 12 stays to the rod, all No. 9 hard steel wire. Spacing 3, 3 1-4, 3 1-2, 4 3-4, 5 1-2, 6, 8, 8. 8. Price per rod	31c
11-54 Has 11 line wires, 54 in. high, 12 stays to the rod, all No. 9 hard steel wire. Spacing 3, 3 1-4, 3 1-2, 4 3-4, 5 1-2, 6, 6, 6, 8, 8. Price per rod	35c
15-50P. Stock and Poultry Fence. Has 15 line wires, 50 in. high, 24 stays to the rod; top and bottom No. 9, filling No. 12. Spacing very close for poultry. Price per rod	35c
Staples, galvanized, 1 3-4 in., per box 50 lbs	$1.40
Brace wire (soft), 25 lb. coil, each	75c
Barb wire, galvanized (two point), 80 rod spools, each	$2.00
STRETCHER—An all-iron stretcher, top and bottom draw, very heavy chain. Extra single wire stretcher and splicer, freight paid with fence orders only	$7.50

Farm Gate made of 1 3-8 tubing, filled with all No. 9 Wire, 12x48. Each $4.00 Farm Gate, 13x48. Each... $4.25 Farm Gate, 14x48. Each... $4.50 Walk Gate, 3 1-2x48. Each... $3.00

The above prices include freight prepaid by us to any railroad station (electric and boat lines not included), south of North Bay in old Ontario. We do not prepay freight on gates, stretchers, barb wire, brace wire or staples, except when ordered shipped with fence.

Customers in New Ontario, Quebec, Maritime Provinces, and the North-West may deduct 2c per rod from the above prices of fence, 25c from the gates, stretcher and barb wire, 10c from the brace wire, and 15c from the staples; customer to pay his own freight from Sarnia. Write us, tell us what style you want, and we will tell you what your fence will cost you after paying your freight. We have never yet found a locality in the Dominion of Canada where our price with the freight added was not less by a good margin than your dealer or agent will ask you.

We urge you to get your order to us without delay, in order to save the advance. Remit cash with your orders. These prices on fence are less than the actual cost of the wire on the open market today, and in order to prevent speculators from placing large orders, thus depriving the farmer of this advantage, we reserve the right to refuse any orders, which in our judgment, would come under this head.

The Sarnia Fence Company, Limited, Sarnia, Ont.

He has now ,earned that plants cannot thrive with some of its members diseased or mutilated. Then he begins to take this lesson home to himself. And this great truth being so concerning plant life, he feels that he himself cannot thrive unless he keeps his body in a healthy condition. And lastly he has found in all his study of plant life, that each plant was created for a purpose, just the same as he has found each part of the plant served a purpose. He naturally concludes that he, himself, was then created for a purpose. He seeks that purpose. He naturally reasons then that the earth would be incomplete without each plant that was created. And of course he feels that he must then be a necessity in this world, else he would not have been created. He now realizes that he is an important being in this great world, and without him there would be something missing. He is a part of the universe. He wants to fill that purpose. When a young man feels that the world cannot get along without him, he is going to have some self-respect, self-pride, respect for others, and he will broaden out in mind, and is going to try to do something. He is going to try to learn to live in such a manner to serve the purpose designed by his maker.

"Things equal to the same thing are equal to each other."—R. S. Walker in Farm and Home.

Roots in Tile Drains.

If there is an elm or willow tree within 60 feet of a drain tile, in which water is running a considerable proportion of the year, the roots of those trees will surely find their way to the tile and choke it up. We have had this experience several times and had to remove the trees. Another trouble is with alfalfa roots. Samples have been sent us of drain tile completely filled with alfalfa root for several feet.

The Massachusetts Station has experimented with this matter for three years and has found the roots can be kept out by covering the tile with excelsior or sawdust soaked with creosote.—Hoard's Dairyman.

McClary's

FREE
HANDSOME
FURS

Big handsome Fur Muff or Scarf, the most fashionable shape and style ever known. Made from beautiful rich full furred skins, warm, dressy, and bound to give years of wear and satisfaction. Muff is finished with corded silk wristlet, lined with finest quality black sateen and the scarf is the newest Parisian throw-over style. OVER 48 INCHES LONG. Has all the appearance of a $50.00 SET OF FURS.

We give you choice of either the handsome muff or scarf, if you will sell only 14 of the world famous Gold Dollar Flavoring Extracts among your friends and neighbors at only 25c. each. They come in all the finest flavors, Vanilla, Lemon, Orange, Raspberry, Strawberry, Almond and 20 others. Handsomely put up in new style collapsible tubes. Four drops of Gold Dollar Flavors equals a teaspoonful of ordinary extracts and each tube is guaranteed to equal five regular 25c. bottles of ordinary flavorings. Every lady who tries a tube can receive a fine present of a 50c. cook book free from us. You can sell three or four different flavors in every house. We are spending thousands of dollars to introduce these grand new extracts into every home in the land and we send such a grand assortment of flavors, that you will surely sell only 14 in a few minutes. Return our $3.50 when sold, and we will promptly send you either this handsome muff or scarf, all charges paid by us, exactly as represented. Write for the extracts to-day. We trust you with them until sold.

National Products, Ltd., Dept. F. 235 Toronto, Ont.

ONE CENT A WORD

Trappers learn to make Scofield fox scent. I'll show you how for 50 cents. Also make smokeless gun powder for 50 cents. Both 80 cents. MOSES PERRY, Cody's, N. B.

MACHINERY—We offer for sale the Machinery used by the New Glasgow Creamery Company. This machinery will be sold at scrap price as we require the room taken up by same. One Stoddard two-door power churn $15 for quick sale. This churn is as good as new and is complete with bearings, etc., all ready for power. The STEEL FURNISHING CO., New Glasgow, N. S.

Horse Comfort

No patient beast has his patience more sadly imposed upon than the horse. In a hubdred ways horses are made to suffer needless discomfort through the carelessness or thoughtlessness of their drivers. How often you will see horses working in the field on a doubletree so short that the cause the animal to be put to a concauses the animal to be put ta a constant and unnecessary strain to overconduct this indirect pull. Sometimes, too, when the doubletree is long enough to bring the centre of the singletree directly behind the horse the singletree is so narrow that both tugs press uncomfortably on the ribs.

A doubletree too low often causes heavy pressure on the back by pulling down on the back pad or in the absence of that feature on the harness brings the draft too low to strike the right point of the shoulder. The length of the checks is sometimes in wrong adjustment, so that the animals' heads are held too far in or too far out, giving them needless discomfort and annoyance. Some men will work a horse day after day with an ill-fitting collar without doing what he can to relieve the matter by adjusting the hames. It is not unusual to see horses working hour after hour with a big wisp of the mane squarely under the collar chafing the shoulder.

AS THE MAN, SO THE HORSE.

What farmer doesn't take a jug of water to the field on a hot summer day, but how many take water for the horses? Some do, we know, and are rewarded by better service on the part of their horses too. Many farmers are not thoughtful enough to face their horses toward the breeze while resting them, although this is much more refreshing than standing with their backs to the breeze.

Every implement that has a tongue to slap and pound horses should have a tongue truck. A disk without a tongue truck is an unmerciful thing on the horses obliged to carry the tongue. A binder tongue does not slap so badly, but the great weight sometimes thrown on the tongue there is a heavy burden on patient necks.

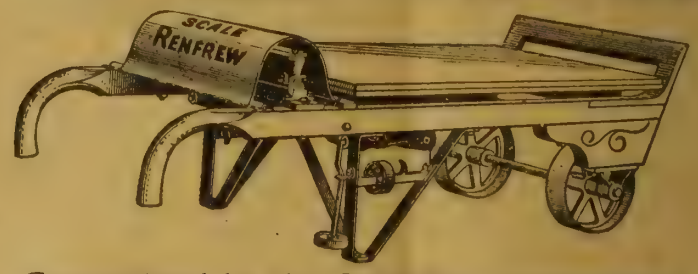
We wonder why more wagons are not built with a stationary front axle, like an automobile, and made to guide with the tongue just as an automobile is guided, not by swinging the wheels alone. This would eliminate all tongue slapping when the wagon passed over rough ground. Some wagons are, or used to be, built this way, and we have never been able to understand why the idea was not more generally accepted.

LIKE TREATMENT FOR CRUEL DRIVERS.

We have not mentioned here the driver who cruelly beats and jerks his horses. Fortunately there are not many such on farms. When we do see one, however, we want to put him in the place of the abused horses. Almost all drivers want to be square with their steeds, and make the labor as bearable for them as possible, but as we have said, thoughtlessness and carelessness lead to a great deal of horse discomfort that might be avoided. We have not attempted to point out all of the possible sources of needless suffering and annoyance to horses, but only to start some thought waves. Look your outfit over and see if you are doing all that you might do to make your horses comfortable while at work.—Nebraska Farmer.

THE FARM SCALE THAT SAVES MONEY FOR FARMERS

THE RENFREW HANDY TWO WHEEL TRUCK SCALE



Guaranteed by the Canadian Government

The Renfrew saves every cent of profit for the farmer on everything he sells by welght,—because of its absolute accuracy.

It saves for him time and labor,—simply wheel the Renfrew to what you want to weigh.

It saves for him because it is built to last,—and weighs everything from one pound to 2000 pounds.

Does your scale do these things? If not, it is time to buy a Renfrew —the farm scale built to suit your requirements.

MAIL COUPON NOW FOR OUR FREE BOOKLET

Mail Coupon For This Free Booklet—"The Profit in The Last Ounce." It tells interestingly about the business side of farming,—and how money is saved with the Renfrew Handy Two-Wheel Truck Scale.

Butter Destined for Canada.

The great demand upon Canada's dairy products, in consequence of increase in population, suggests the thought to your Commissioner that probable sources of supply for butter for next season might be interesting to know.

Butter is shipped from New Zealand to Canada by way of Vancouer direct and via San Francisco and transhipped to Vancouver. The system is to reserve cold storage space on the vessels engaged in this trade, and for the season from September to May by the Vancouver direct boats space has been reserved for 65,985 boxes, and space for 35,000 boxes is now the subject of negotiation. Together this will make 101,285 boxes of butter to be shipped direct to Vancouver for the period named.

In addition to the above, arrangements have been made to ship 23,700 boxes of butter to Vancouver via San Francisco—a grand total of 124,985 boxes of butter which will leave here for Vancouver between the months of September, 1912 and May, 1913.—W. A. Beddoe, Canadian Trade Commissioner, New Zealand.

FLORICULTURE.

M. A., St. John, writes:—Will you please tell me how to treat a three-year-old Holly Fern. Lately the leaves have started to fade and dry up and no new ones have come since July. The pot seems amply large and the drainage is good. It is free from insects. The plant stands in a large bay window with southern exposure, and is treated exactly like a fern of the same kind that is nine or ten years old. I cannot understand this continued loss of fronds.

Ans.—Turn ball of roots out of the pot and look carefully for worms or other insects. Remove dead roots and report in fresh soil in as small a pot as you can easily get the roots in. It is possible that the plant has been fruiting freely and is somewhat dormant now. Be rather sparing of water on the soil until new growth appears. It is advisable to moisten the foliage as often as possible.

Harry, of Moncton, N. B., writes:—I have a medium Christmas Cherry, which has quite a lot of flowers on it and a few green cherries. I am told that the fruit will not ripen in time for Christmas. What can I do to hasten this development? I have also some potted White Hyacinths that are showing buds, will they be all right for the holidays? What sort of seed does a Banana tree have and where can they be procured? Do they make a good home plant if kept warm?

Ans.—Unless you had sunshine every day and very favorable quarters you cannot get your Cherry red for Christmas. Plants that we rely on for finely berried plants were in bloom in August last.

If your Hyancinth are White Roman they will be about right for Christmas. See that they have plenty of water from now on. Our common fruiting Banana has no seed. You probably mean the Abysinian Banana, which produces seed that resembles weather worm cubes of flint about one-half inch square. This variety makes a very good house plant, but it is hard to start from seed as so few of them will germinate Out of twenty-five seeds if one gets two or three plants the venture may be counted a success. Bananas are very susceptible to red spider and thus require a great deal of moisture. Out of doors, in the summer, they do well if protected from heavy winds, which if located otherwise cause the plant to shed the leaves very quickly and thoroughly.

Have all your hardy plants, Roses and Shrubs covered by the middle or last of November.

Halifax Market Report.

GRAIN.—Wheat, feed purposes, $1.50 to $1.60 per 100 lbs; Oats, 55c. to 57c.; Peas, round, $6.75 to $7.00 per bbl.; Barley, split, $7.50.

When You Get Run Down

—catch cold easily—and dread, instead of enjoying, the keen winter weather—then you need

Na-Dru-Co Tasteless

Preparation of

Cod Liver Oil

This Na-Dru-Co Compound embodies the well-known nutritive and curative elements of Cod Liver Oil—Hypophosphites to build up the nerves—Extract of Wild Cherry to act on the lungs and bronchial tubes—and Extract of Malt, which, besides containing valuable nutriment itself, helps the weakened digestive organs to assimilate other food.

The disagreeable taste of raw Cod Liver Oil is entirely absent, and the Compound is decidedly pleasant to take. In 50c. and $1.00 bottles, at your Druggist's. 306

NATIONAL DRUG AND CHEMICAL CO. OF CANADA, LIMITED.

A Good Cream Separator is a Paying Investment.

A good cream separator is one of the best paying investments on any farm where three or more cows are kept. If you have been skimming your milk from pans, cans or crocks, you will be surprised to find how much more, fine smooth, rich cream you can get by using a hand separator. In the cold winter months while the milk yield is smaller the butter fat is the more valuable and harder to separate from the skim milk than it is in the summer. For these reasons you really need a separator as much if not more, in winter than in summer and between this time and next spring the extra cream you get will go a long way toward paying for the best separator you buy. the best separator you can buy.

Then think of having the fresh, warm skim milk to feed the growing pigs, calves and chickens. When mixed with a handful of oil meal to take the place of the butter fat which has been removed, warm skim milk from the separator makes an ideal winter feed. The women will appreciate the separator when the cold days come. The skimming can be done so much easier and the separator washed in less than half the time it takes to gather the cream in the old way.

Of course, there is a big difference in separators. Some skim closer, wash easier, run easier and last longer than others. The Sharples Tubular Separator is without a doubt one of the simplest of all separators as it has no loose parts inside the bowl which make it very easy to clean. It is also light running, quiet in operation and convenient in height. The Sharples Separator Co., are the world's largest and America's oldest manufacturers of cream separators. Their machines are in daily use and giving splendid satisfaction to owners all over the world.

We suggest that you write them at once for their latest catalogue, mailed to you free and postpaid.

Protected Hands.

Always wear old gloves in cleaning or blacking the stove. If there are no worn out ones belonging to the men of the family, buy a yard of canton flannel and make several pairs of mittens; have them loose and keep some of them for dusting and one pair may be used to draw on the hands at night after some healing lotion has been used. This pair must always be clean, as nothing is gained by applying cream and then wearing soiled gloves, for when the pores are opened by the salve they absorb dirt more readily than usual.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

B., during the week ending April 20th; also person who sent in postal notes numbers 281857 and 281858, amounting to 80c. postmarked Tatamagouche, kindly notify The MARITIME FARMER Office, Sussex, N. B.

Concentrated Feeding Stuff

We have pleasure in directing attention to an instructive article on the "Composition and Properties of Concentrated Feeding Stuffs," which appears in last month's issue of the Journal of the Board of Agriculture.

The outlay on these substances is so large that it is very desirable their use should be understood. Many farmers, it is said, supply their animals with unnecessarily large quantities of albuminoids, and thereby not only make their feeding unduly expensive, but in some cases may seriously affect the general welfare of their stock.

The value of a feeding stuff should be judged:—

1. By its composition, digestibility and productive value.
2. By its content of manurial ingredients.

The most important factor is digestibility.

It is not enough to look at the percentages of albuminoids, oils, and carbohydrates given in the vendor's analysis, because such an analysis gives no information as to the digestibility of each ingredient, and yet it is only this portion that can be regarded strictly as food. For instance comparing linseed cake and undecorticated cotton cake, we find that of the albuminoids in the former 86 per cent. are digestible, while of the latter not more than 77 per cent. are thus available. This explains the practical preference given by farmers for linseed cake, even at its higher unit cost of total albuminoids.

Then the proportion of "fibre" is important; a high proportion of crude fibre should be regarded with suspicion, since it usual,y indicates the presence of husks or other highly indigestible ingredients. In general, foods containing more than 10 per per cent. of crude fibre require special care in their use, especially if the fibre is largely in the form of hairs or wooly material. Farmers should insist on an analysis of a feeding stuff including the percentage of "fibre." In calculating the value of fibrous foods, the value of the digestible substances will be considerably overrated if the presence of an abundance of crude fibre is not taken into account.

MANURIAL INGREDIENTS IN FOODS.

Farmers naturally attach great importance to the additional fertilizing value of the manure produced by animals supplied with concentrated foods. All foods contain appreciable quantities of valuable manurial ingredients, notably, nitrogen, phosphates and potash. These ingredients are voided to a considerable extent in the solid and liquid excrements of the animals. With full-grown fattening beasts or working horses, practically all the fertilizing ingredients are recovered in this way, but in the case of young animals and cows in milk the proportion recovered is smaller. The proportion of nitrogen, phosphates and potash present vary greatly in different foods, and the value of the manurial residue arising from the consumption of equal weights of the food varies accordingly. This fact should be taken into account in comparing the cost of different foods, because the real cost of a food stuff to the farmer is obviously its price less the manurial value.

Why Horses Get Sick.

I recently had a very interesting conversation with a livery man in a nearby city, which throws some light on the cause of the ills of horses. This livery man has a dozen or more horses of his own and also boards horses for business men around town. The livery man's own horses are worked regularly. Sometimes they get almost too much driving. The other horses are only driven occasionally for pleasure; and occasionally a week or more will pass without them ever being out of their stalls. This livery man informed me that his horses were rarely, if ever, sick, while the boarding horses were being doctored for various ills half the time.

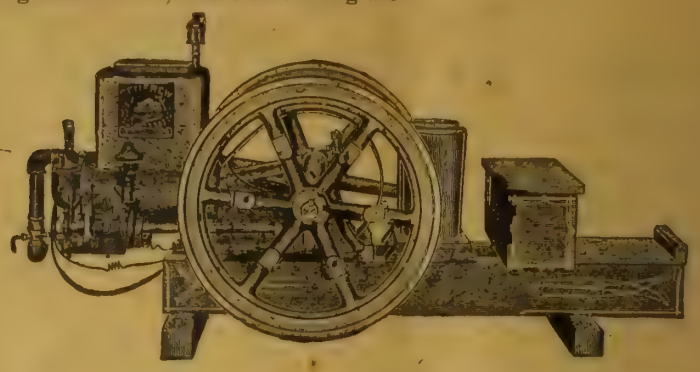
On the farm our horses are worked more of less irregularly. At certain seasons there is hard strenuous labor every day; at others there is nothing to do for long periods. It is then that our horses are troubled with indigestion, stocky legs, etc. "Regular exercise," said my friend the livery man, "is the means of keeping horses healthy, and I might add that regular grooming and regular hours of feeding also contribute to horse vigor." We farmers should remember this.—Jas. Armstrong in Farm and Dairy.

Poisoned Poultry Yards.

The poultry yard should be changed occasionally. There is such a thing as poisoned poultry yards, that is, where fowls run on land too long it becomes contaminated and diseases zand insecte are apt to become numerous. The remedy for this is to move the poultry yard, put the former grounds in some kind of a crop and cultivate it well. Such land is generally very rich from poultry droppings and it may be expected to produce plants. If the new yard is selected near the former, where it is convenient to turn the fowls into planted land, no better crop can be planted than one for green food for fowls.

The Tireless Worker

Will work 24 hours a day when necessary, and be fresh and eager for more. There's no tiring the



Renfrew-Standard

gasoline engine. It never stops for a meal, or quits working when you are not looking. Do you wonder it is taking the place of man-power on the farm? Pumps water—saws wood—runs the separator, the churn, the washing machine, the electric light machine, the feed grinder, the ensilage cutter. Does a hundred and one other things that lessen drudgery and cut down expenses. Simple in construction, simple in operation. Starts easily. No cranking with the ***Renfrew-Standard.*** It's the latest and best type of gasoline engine for sale in Canada. Write for Bulletin describing the various styles and sizes. 2 1-2 h.p. to 60 h.p. Semi-Portable, as illustrated; Stationary and Portable. Fully guaranteed. Has the same organization behind it that have made such a success of the famous "Standard" cream separator.

M. H. PARLEE, Lower Millstream, N. B.

Creosoting Fencing Posts.

Creosote is one of the best preservatives for fencing posts, but the treatment requires care and a little trouble. It is in the first place most essential that the timber be thoroughly seasoned. If any sap or moisture be in the wood the creosote only encases it, and so quickens decay.

It is regarded as sufficient to treat the bottom 40 in. of the post, so that the portion in the ground and a little above will be protected. For farm use one tank is sufficient. An old iron boiler is suitable. A galvanized iron tank has too thin a bottom. Fill the tank with posts in the morning, and build a fire under it which will last about two hours before burning out. The posts will cool down during the day, and by night will be treated. More posts can then be put in, heated, and allowed to cool during the night. In cool weather three runs can be done per day. A gallon of creosote should treat three or four posts or more, according to the wood.—Pastoralists Review.

Conservative Farming.

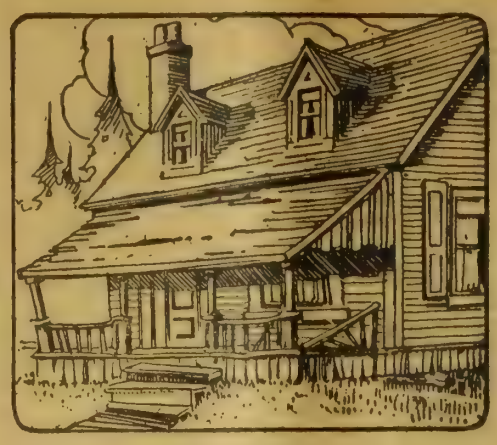
The farmer who goes into the same thing each year without stopping to figure the cost is not apt to make a success of the business. When he knows who gets the profit, he will be sure of success and will work for himself instead of others. He will not continue in any unprofitable branch because he has been at it all his life, or because his father and grandfather followed the same branch. When he begins to use his lead pencil he has started on the upward road. One of the most successful farmers I ever knew keeps an account book of everything bought and sold, of every loss on the farm, and every cent expended for labor, and at the end of every month he goes over his accounts and knows just where he stands. His family do not buy everything they want, but what is needed, and can be afforded, and it is needless to say that this farmer has very little fear of his family having to some day "go over the hills to the poorhouse."

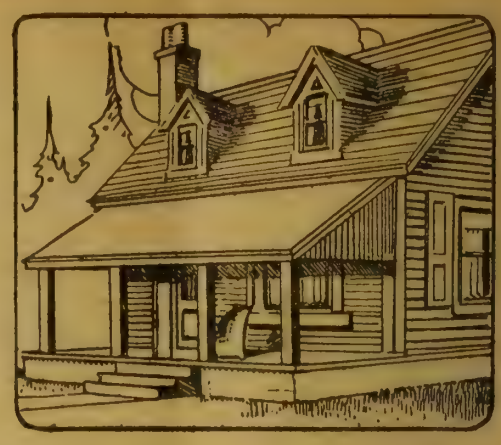
Some people learn slowly and it takes a great deal of exfierience to instruct them. Too many think they must have everything their neighbors have, and they go at such a pace that there is seldom even a dollar ahead. A young man who has just started out in married life, and who had a small farm and a tiny cottage, was asked if he was going to build a larger house. He replied, "No, father has always tried to make as big a display as his neighbor and has always been in strained circumstances to keep up. I have learned from him and intend to go slowly, and make improvements just as I can afford to make them and have a home for myself and family." In this age of "frenzied finance" it takes courage to go slowly, and most young couples think they must start an establishment equal to their parents. Too few are willing to start at the bottom and work their way up.

There is no life that can give more pleasure than that of the farmer, if he lives within his means, and works according to his strength. Too many farmers make work horses of themselves and get very little out of life.

All work and no play will spoil any life. Nearly all young farmers must work hard, but they must work intelligently and try to get something out of life besides work, if they would succeed. They should manage to have recreation at some season of the year, and can plan so as to drive their work, and never allow their work to drive them. Each and every one should try to see what he can make of himself. All the world depends upon the farmer and in this country he is one of the most independent of beings and should be one of the most intelligent, although a great many do not think so.

There should be a farmers' club in every neighborhood, and there should be the best of farm papers in every home. And brain as well as brawn must be used by the one who would succeed. Onward and upward should be the motto of every farmer, and he should strive for what is truest and best in life. Life is full of ruts and too many are content to stay in them, not hoping for anything better. Every farmer who is trying to help himself and succeed is an honor to his calling and has the respect of his fellow man.—A. M. L.





Instead of "patching up" your house, repair for good with concrete

A FEW bags of "Canada" cement, some stone and sand and water, mixed and placed where needed, will make an old house look like new. What is more important, the improvements,—be they porch floor, foundations, steps, chimney-caps, or column-bases—are made to last. Time, wear and weather have no effect upon concrete, except to make it stronger.

Even if you have never used concrete, you can quickly learn how from our 160-page book,

"What the Farmer can do with Concrete"

Which we will send to you free upon request. It will show you how to build a concrete porch as well as how to use concrete for scores of other purposes around the home and on the farm.

Write for it to-day. It is absolutely free.

WHEN you buy cement, be sure it's "Canada" cement. Then you can be certain of satisfaction.

Address

Canada Cement Company
Limited
514 Herald Building, Montreal

OUR Free Information Department will answer any questions on the use of cement without obligating you in any way.

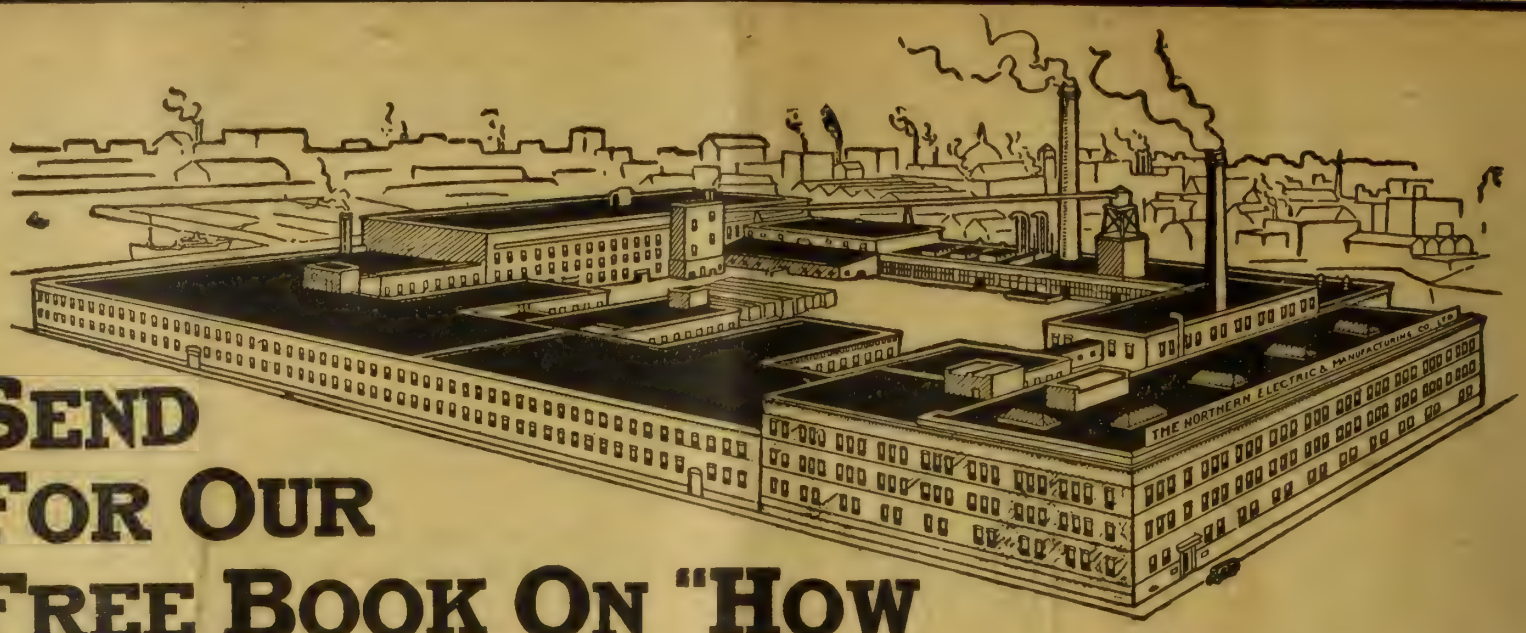
If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than a2.00 each and they are a bargain at the price.

THE MARITIME FARMER, SUSSEX, N. B.



SEND FOR OUR FREE BOOK ON "HOW TO BUILD RURAL TELEPHONE LINES"

YOU do not need to know anything about company organization or telephone line construction to start a telephone company in your own community. "How to Build Rural Telephone Lines" will tell you absolutely everything you need to know. When you have read this book you will be amazed at the simplicity of the whole proposition and wonder why you and your neighbors have not had a telephone system of your own long ago. Sooner or later someone is going to start a telephone system in your neighborhood. Whether you or one of your neighbors chances to be that "someone," you owe it to yourself to be fully informed on the subject.

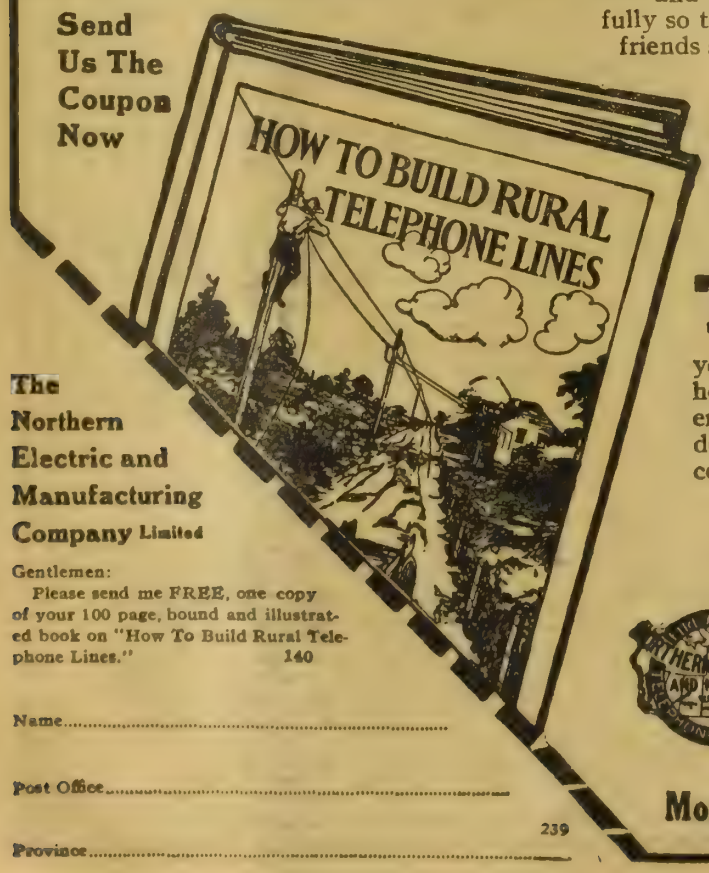
We Send This 100-Page Illustrated Book Only on Request

THIS book contains seven chapters of detailed information on the construction of rural telephone lines, abounds in photographic illustrations and diagrams and deals with every vitally essential fact as does no other book in existence. Remember this book has cost too much money to prepare to send it out haphazard. While we will be glad to send you a copy, we will not do so until you ask for it. If you are interested in the subject send us the coupon and we will send you one copy of this volume free by return of mail.

Let Us Teach You How To Start Your Own Telephone Company

THE full details of company organization are described in this book. Mutual and stock companies are explained fully so that you can go out among your friends and neighbors and show them just exactly what has to be done.

Send Us The Coupon Now



Let Us Show You How To Build The Line and Put In The 'Phone

THE expert advice of high salaried telephone engineers is back of you in every detail of your line construction. With the help we give, you do not need to employ expert linemen but can keep down the cost by doing your own construction work. One chapter of our book alone shows thirty-seven diagrams and illustrations dealing with this branch of the work. On request we will also tell you of your provincial regulations, what your government demands and what it will do to help you.

Take Free All Our Experience and Knowledge

LET us show you how to get the movement started so that your community can have a rural telephone system and you a telephone on your own wall. We offer you freely all the necessary information and our entire experience is at your disposal for the asking. Send us the coupon now and get your copy of "How To Build Rural Telephone Lines."

The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada.

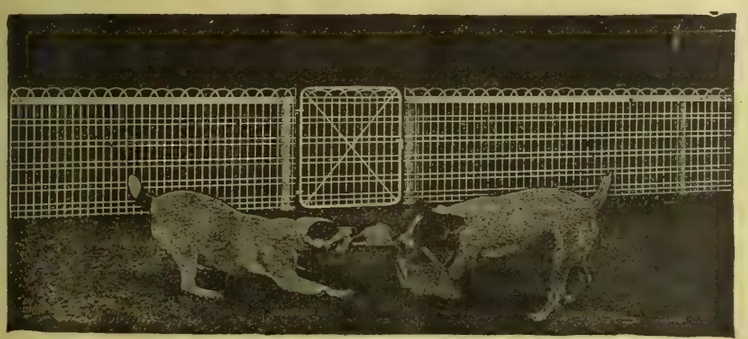
PAGE 'ACME' LAWN FENCE

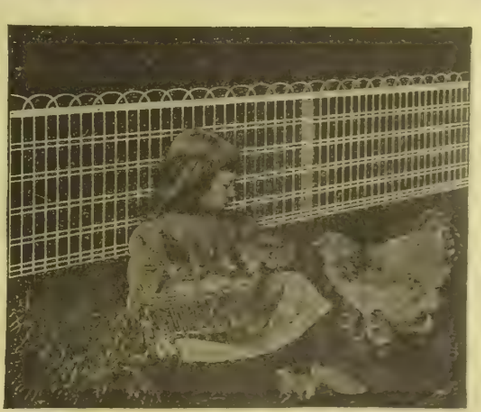
This famous 'Page' Fence comes in rolls up to 200 ft. in length. These are painted either white or green, and you may have "Page Acme" Fence in any height from 2 ft. to 6 ft. tall.

Be sure and get the genuine "Page Acme" Fence, for there are imitations on the market that resemble this fence closely. By getting the genuine "Page Acme" Fence you obtain high-carbon steel wire uprights, which are as stiff as thick iron rods.



This "Page Acme" Fence makes a beautiful fence for lawns, cemeteries, semi-public institutions, parks, etc. It is remarkably low in cost. When you consider the long life it has from being painted at the very beginning of its service, before you even set it up, you will see how economical it is to use this "Acme" Fence.

We have sold hundreds of miles, especially of the 42-inch width, and you will find this "Page Acme" Fence doing service all over the country. Write us today for the Page Catalogue of "Acme" Fences. If you need fence of any kind, remember the Page Catalogue shows it to you at Factory Price—scores of fences of the best quality.



Send Today for the Page Catalogue

This catalogue shows all kinds of Lawn and Farm Fences, fence material, iron fence—everything you possibly can need in this line at moderate prices. Write us today for the Page Catalogue.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Llght" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

To The Public

We beg to announce that we have purchased the good will and interest of the EMPIRE LINIMENT CO. Ltd. and will supply the trade for this excellent Liniment from our factory at Middleton, where all orders should be addressed.

C. GATES SON & CO.

What Says C. H. Purdy, of Bear River, Warden of Digby County, N. S.?

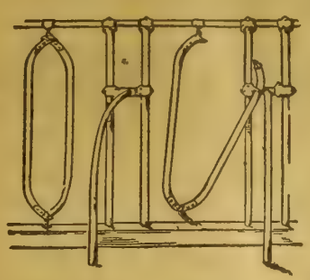
"I was a complete cripple with Rheumatism saw EMPIRE LINIMENT advertised and tried it, after every known Liniment and Rheumatic cure. Here I am to-day, sound and well, after using only a few bottles. I recommend it to all sufferers. Don't be without it.

C. H. PURDY.

THE ADVERTISING PAGES of the Maritime Farmer will help you to get the most value for you money.

Making Farming Easier

EVERY farmer agrees that it is a fine thing to apply scientific methods to farming, and to run a farm on a business basis. The Louden way is the truly scientific and businesslike way to save labor and to ease the day's work.

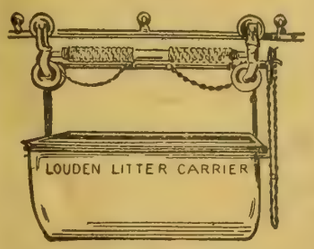


LOUDEN'S COW STALLS AND STANCHIONS keep your cows cleaner and healthier. Therefore the cows give more milk, and this means bigger profits.

Stanchion construction is simple and perfect. Easily opened and closed, but absolutely secure when locked. They allow freedom of movement, and provide a maximum of comfort.

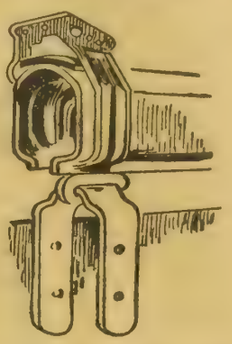
LOUDEN'S FEED AND LITTER CARRIER. The only practical way to handle feed and litter, etc., is by overhead carrier—and the Louden equipment is recognised as being the last word in perfection.

Louden's carriers are of galvanized sheet steel on elevated steel tracks—run anywhere—round corners, in and out of doors—from one building to another.



We have different styles of carriers and we will advise you as to the tracking suitable for your requirements.

Write for information.



LOUDEN'S BARN DOOR HANGERS. We manufacture five styles of hangers to suit different purposes. We recommend Louden's Bird Proof Door Hanger—as illustrated. It is the strongest and most durable, and consequently the cheapest hanger in the long run.

The construction protects these hangers from ice in winter and nesting birds in summer. Can't rust, can't balk. Thoroughly reliable.

THIS BOOK SENT FREE

Our Book, "Perfect Barn Equipments," will be useful to you, as it illustrates and tells about many modern inexpensive articles that turn chores into play and cut down expense of farm labor—write for it to-day, it's free.

LOUDEN MACHINERY CO., Dept. 28, GUELPH, Ont.

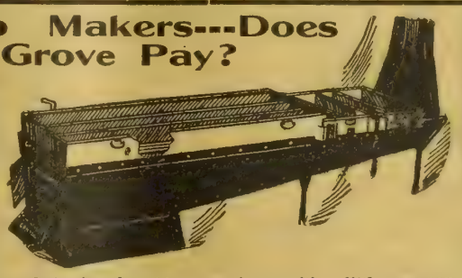
Maple Syrup Makers---Does Your Maple Grove Pay?



You must go at it in the right way to make money out of your Maple Grove. You are not giving your Maple Grove a show to bring good returns by using pots and old pans which consume a lot of fuel and time and make a very poor grade of syrup.

Every farmer who possesses a Maple Grove should operate it with an up-to-date Evaporator. The "Champion" Evaporator will get more syrup out of a given amount of sap, with less trouble than any other Evaporator on the market. Any boy 14 years of age with a little common sense can operate a "Champion" Evaporator and make the highest grade of syrup that will command the highest market price.

Write us to-day for our new illustrated catalogue free.

DE LAVAL
CREAM SEPARATORS

Are In a Class by Themselves

They cost but a little more than the cheapest, while they save twice as much and last five times as long as other separators.

They save their cost every six months over gravity setting systems and every year over other separators, while they may be bought for cash or on such liberal terms that they will actually pay for themselves.

Every assertion thus briefly made is subject to demonstrative proof to your own satisfaction by the nearest DE LAVAL local agent, or by writing to the Company direct.

Why then in the name of simple common sense, should anyone who has use for a Cream Separator go without one, buy other than a DE LAVAL, or continue the use of an inferior separator?

173 William Street, MONTREAL, CAN.

VALUE $325.00

1st Prize---MAGNIFICENT UPRIGHT PIANO AND STOOL TO MATCH. VALUE $325.00
(It is on view any business day from 9 to 5 at our factory)

2nd Prize	$25.00 In Cash
3rd Prize	15.00 In Cash
4th Prize	10.00 In Cash
5th to 9th, 5 Prizes of $5 Each,	25.00 In Cash
and 25 Prizes of $1.00 Each,	25.00 In Cash
TOTAL CASH PRIZES	$100.00

CONDITIONS

1. This contest is absolutely free. You are not asked to spend a cent of your money or buy anything to enter.
2. Children under 12 years of age will not be permitted to enter.
3. No employee of ours or relation of employee will be allowed to compete.
4. The prizes in this contest will be awarded to correct answers according to handwriting and general neatness. Be neat and you may win a good prize.
5. Judging will be done by three gentlemen having absolutely no connection with this firm. Their decision is to be accepted as final.
6. Their is a simple condition to be fulfilled which we ask of all contestants. As soon as your answers is received, we will write advising you if it is correct and telling you of this condition.

THE PUZZLE

RENTLAWCES
SARERF
ARAIGAN
ckahewatnsaS

The jumbled letters given above represent the names of Four Great Canadian Rivers. To help you solve them we have underlined the first letter in each name. **The first is St. Lawrence.** Now guess the rest and send us in your solution of all four names in your very neatest and best handwriting.

DO NOT DELAY. GET YOUR ANSWER IN TO-DAY.

Volume 18. SUSSEX, NEW BRUNSWICK, NOVEMBER 19, 1912. Number 4.

The Practical Value and Necessity of Supplying Plant Food in Systems of Permanent Agriculture.

By Cyril G. Hopkins, University of Illinois.

I TAKE it that the only justification for me to review the subject of plant food in relation to soil fertility or crop production is the fact that recent publications from the federal Bureau of Soils have strongly affirmed that there is no necessity of applying plant food in the restoration and maintainance of soil fertility. Two principal questions are raised: First; Does plant food applied increase crop yields in harmony with recognized soil deficiencies and crop requirements? Second; will the rotation of crops maintain the productive power of the soil by avoiding injury from possible toxic excreta from plant roots? I shall try to present facts and data and exact quotations rather than my own opinions concerning these questions of such fundamental importance in relation to systems of permanent agriculture.

In 1803 DeSaussure, the French scientist, first gave to the world a correct and almost complete statement concerning the sources of the food of plants, including not only the confirmation of Senebier's discovery of the fixation of carbon in the formation of carbohydrates, but also the evidence of plant requirements for the essential mineral elements secured from the soil.

Sir Humphery Davy and Baron von Liebig did much tp popularize this information during the following half century; and they were followed by Lawes and Gilbert, whose extensive and long-continued investigations furnished the needed proof that the soil must furnish nitrogen as well as the mineral elements; and finally, only twenty-five years ago, Hellriegel discovered the symbiotic relationship between legumes and bacteria which gives access to the inexhaustible supply of atmospheric nitrogen for soil enrichment.

Briefly, it might be said that for nearly a century the world of science has accepted and taught, and the world of advanced agricultural methods has practiced, the doctrine that soilfertility maintainance and soil enrichment require the restoration or addition of plant food, including particularly phosphorus and nitrogen, which are most likely to become deficient in normal soils, potassium where needed, and sometimes lime or limestone, which always supplies calcium, and magnesium as well if dolomitic limestone be used. Of the other five essential elements, carbon and oxygen are secured from the carbon dioxide of the air, hydrogen from water, and iron from the inexhaustible supply in the soil; while the sulphur brought to the soil in rain and otherwise from the atmospheric supply, resulting from combustion and decomposition of sulphur-bearing materials, supplemented by the soil's supply and by that returned in crop residues, appears to be sufficient to meet the plant requirements and the loss by leaching.

After nearly a century of increasing agricultural practice of this doctrine on much of the farm land of Germany, France, Belgium, Holland, Denmark, and the British Isles, those countries have approximately doubled their average acre-yields. The ten-year average yield of wheat in the United States is 14 bushels per acre, while that in Europe has gone up to 29 bushels in Germany, to 33 bushels in Great Britain, and to more than 40 bushels per acre in Denmark. Theannual application of phosphorus even to the soils of Italy has alreadybecome greater than the phosphorus content of all the crops removed. The exportation of out highest grade phosphate rock from the United States to Europe now exceeds a million tons a year, carrying away from our own country twice as much phosphorus as is required for the annual wheat crop of all the states, and millions of acres of farm land in our own Eastern States have already been agriculturally abandoned because of depleted fertility and reduced productive power; so that it is now impossible for our Congressmen to enter the Capitol of the United States from any direction without passing abandoned farms.

Ultimate analysis has shown that the most common loam soil of touthern Maryland, almost adjoining the District of Columbia, contains only 160 pounds of phosphorus, 1,000 pounds of calcium, and about 900 pounds of nitrogen in two million pounds of surface soil, corresponding approximately to an acre of land 6 2-3 inches deep. The clover crops harvested from the rich garden soil at Rothamsted in eight consecutive years removed more phosphorus and calcium from the soil than the total amounts contained in the plowed soil of this wornout Maryland land, whose total nitrogen content is also less than would be required for seven such crops of corn as we harvest on good land in the central west, which, however, contains ten times as much of these plant foods as the depleted Maryland soil.

During the last ten years our population increased 21 per cent, the same as during the preceding decade, while the acreage of farm lands increased less than 5 per cent, and the federal government reports all future possible increase in farm land at only 9 per cent of our present acreage.

Average crop yields for four 10-year periods are now reported by the United States Department of Agriculture. A comparison of two 20-year averages shows increased acre-yields of 1 bushel for wheat, and ½ bushel for rye, while the yield of corn has decreased 1½ bushels and the yield of potatoes has decreased 7 bushels per acre, by 20-year averages. These crops represent our greatest sources of human food, even our supply of meat being largely dependent on the corn crop. Less than 20-year averages are not trustworthy for a consideration of any small increase or decrease in yield per acre. It should be noted that during the last forty years vast areas of virgin wheat land had been put under cultivation, including the Dakotas, which now produce more wheat than all the states east of the Mississippi, save only Indiana and Illinois.

A comparison of the last five years with the average of the five years ending with 1900 shows that our wheat exports decreased during the decade from 198 million to 116 million bushels, and that our corn exports decreased from 193 million to 57 million bushels.

Thus we have fed our increasing hopulation not by increasing our acre-yields, but by a slight increase in the acreage of farm land and by a large decrease in our exportation of food stuffs; and the fact must be plain that before another decade shall have passed we shall reach the practical limit of our relief in both ofthese directions.

Indeed, a most common subject already discussed in the press and investigated by national, state and city authorities during the last three or four years is the high cost of plain living.

With these facts and statistics before us, let us consider the actual results secured from field and laboratory investigations:

Where wheat has been grown every year since 1844 on Broadbalk Field at Rothamsted, England, the average yield for fifty-five years has been 12.9 bushels per acre on unfertilized land, 35.5 bushels where heavy annual applications of farm manure have been made, and 37.1 bushels per acre where slightly less plant food has been applied in commercial form.

Barley grown every year on Hoos Field at Rothamsted has produced, for the same fifty-five years, an average yield of 14.8 bushels on unfertili-

zed land, 47.7 bushels with farm manure, and 43.9 bushels where much less plant food was applied in commercial form.

Potatoes grown for twenty-six consecutive years, also on Hoos Field at Rothamsted, produced, as an average, 51 bushels per acre on unfertilized land, 178 bushels where farm manure was used (reinforced with acid phosphate during the first seven years), and 203 bushels where plant food was applied in commercial form. The first year of this investigation the unfertilized land produced 144 bushels, land receiving farm manure alone produced 159 bushels, and land fertilized with commercial plant food produced 328 bushels per acre.

Director A. D. Hall, of the Rothamsted Experiment Station, makes the following statements on "The Rothamsted Experiments."

"On the plots receiving farmyard manure, and even on those receiving only a complete artificial manure, the crop was maintained in favorable seasons. No falling-off was observed which could be attributed to the land having become "sick" through the continuous growth of the same crop, or through the accumulation of disease in the soil."

In commenting upon these same experiments, Milton Whitney, Chief of the United States Bureau of Soils, makes the following statement in Farmers' Bulletin No. 257:

"One of the most interesting instances going to show that toxic substances are formed and that what is poisonous to one crop is not necessarily poisonous or injurious to another is a series of experiments of Lawes and Gilbert—the growing of potatoes for about fifteen years on the same field. At the end of this period they got the soil into a condition in which it would not grow potatoes at all. The soil was exhausted, and under the older ideas it was necessarily deficient in some plant food. It seems strange that, under our old ideas of soil fertility, if the soil became exhausted for potatoes, it should grow any other crop, because the usual analysis shows the same constituents present in all of our plants, not in the same proportion, but all are present and all necessary, so far as we know. This field was planted in barley, and on this experimental plot that had ceased to grow potatoes they got 75 bushels of barley."

If, now, we turn to the actual records of the Rothamsted experiments grown after twenty-six years of potawe find that the first crop of barley toes was 32.2 bushels per acre on unfertilized land, only 24.8 bushels where minerals alone had been used and the soil depleted of nitrogen by the potato crops, 67 bushels per acre where minerals and nitrogen had been used, and 72.4 bushels where farm manure had been applied for twenty-six years. We also find, in strict harmony with Director Hall's statement, that the largest average yield of potatoes from the farm manure plots (3 and 4), either for one year or for five years, was secured after potatoes had been grown on the same land for more than fifteen years.

On permanent meadow land at Rothamsted, the average yield of hay for fifty years was 1¼ tons per acre on unfertilized land, and more than 4 tons per acre on land heavily fertilized with commercial plant food. During the last ten years of this fifty-year period the unfertilized land has produced an average yield of 1863 land has produced 8490 pounds per pounds of hay, while the fertilized acre.

On Barn Field at Rothamsted, mangels were grown for thirty years. The average yield per acre was 4¼ tons on unfertilized land, 19½ tons where farm manure had been applied, and 29 tons per acre where the farm manure had been reinforced with nitrogen and phosphorus in commercial form.

In 1902 the University of Illinois began a series of experiments on the common corn-belt praire land in McLean county, on a field which had grown no wheat for thirty-two years. We first grew wheat in 1905. Four plots not receiving phosphorus produced respectively, 28.8 bushels, 30.5 bushels, 33.2 bushels and 29.5 bushels of wheat per acre; while four other plots which differed from these only by the addition of phosphorus, at the rate of 25 pounds of that element in 200 pounds of steamed bone meal per acre per annum, produced 39.2 bushels, 50.9 bushels, 37.8 bushels, and 51.9 bushels, respectively per acre. Six years later wheat was again grown on this land, when the four plots not receiving phosphorus produced, respectively, 22.5 bushels, 25.6 bushels, 21.7 bushels, 27.3 bushels, per acre, and the other four plots, which differ from these in treatment only by the phosphorus applied during the ten years, produced 57.6 bushels, 60.2 bushels, 54.0 bushels, and 60.4 bushels, respectively, of wheat per acre, this being the second crop of wheat grown on this land in forty years.

This most common praire land of the Illinois corn belt contains 600 pounds of phosphorus and 18,000 pounds of potassium per million of surface soil, while one million pounds of the subsoil contain 450 pounds of phosphorus and 27,000 pounds of potassium. This is the type of soil on which, as an average of four different tests each year under four different conditions of soil treatment, the addition of phosphorus produced an increase in yield per acre of 9.6 bushels of corn in 1902, of 17.8 bushels of corn in 1903, of 14.8 bushels of oats in 1904, of 14.4 bushels of wheat in 1905, of 1.46 tons of clover in 1906, of 18.8 bushels of corn in 1907, of 17.3 bushels of corn in 1908, of 15.2 bushels of oats in 1900, of 2.56 tons of clover in 1910, and an average increase of 33.8 bushels of wheat per acre in 1911.

As an average of four similar tests during the ten years, applications of potassium (costing the same as phosphorus) increased the yield of corn by 3.1 bushels, decreased the yield of oats by 2.3 bushels, decreased the yield of clover by 70 pounds per acre, and increased the yield of wheat by .1 bushel per acre, these being the general average results from the four years of corn and from two years each of oats, clover, and wheat.

If now we turn to the extensive peaty swamp soil of northern and north-central Illinois, we find by analysis that it contains in one million pounds of the surface soil 1960 pounds of phosphorus and 2930 pounds of potassium, of more than three times as much phosphorus and less than one-sixth as much potassium as the common prairie. We also find that, as an average of triplicate tests each year, potassium increased the yield of corn per acre by 20.7 bushels in 1902, by 23.5 bushels in 1903, by 29.0 bushels in 1904, and by 36.8 bushels in 1905; while the addition of phosphorus produced a decrease of .1 bushel in 1902, and an increase of .9 bushel in 1903, of 3.9 bushels in 1904, and of .3 bushel in 1905.

As an average of the results from twenty plots of unfertilized land in the Pennsylvania rotation experiments with corn, oats, wheat, and hay (clover and timothy mixed), the crop values in two consecutive 12-year periods decreased by 26 percent; while, as an average of the twenty-four years, the crop values were increased 62 percent by farm manure and 65 percent with commercial plant food, as compared with the results from unfertilized land.

NEXT SHORT COURSES

AT THE

Agricultural College, Truro, Nova Scotia

JANUARY 7th to 17th, 1913

Special courses for MEN and for LADIES open FREE to all students from the Maritime Provinces. In the past, these courses have been attended by people of all ages from sixteen to over seventy.

In the men's Short Course instruction will be given in Judging, Feeding, and Management of Live Stock of all kinds, Soil Cultivation, Crops, Seeds, Horticulture, Dairying, Veterinary Practice, Poultry and, if requested, classes will be provided in Entomology, Botany, Chemistry, etc.

A special feature of these courses will be Instruction in Road Making. The best practical experts available have been secured for this course.

The LADIES COURSE will include Dairying, (especially Butter and Soft Cheese making) Poultry Gardening, Floriculture, and Domestic Science.

All railways in the Maritime Provinces will give single fare on Standard Certificate Plan.

Write for full particulars to

M. CUMMING, Principal, -- Truro, Nova Scotia

The records from the Agdell rotation field at Rothamsted show that as an average of the turnips, barley, clover (or beans), and wheat the yields decreased on unfertilized land by 42 per cent measured by the results from two consecutive 32-year periods; and, if we span a 60-year period, we find that the yield of turnips on unfertilized land was 10 tons per acre in 1848 and less than ½ ton in 1908; that the barley yielded 46.5 bushels in 1849 and only 10 bushels per acre in 1909; the clover produced 2.8 tons in 1850 and less than 1 ton per acre in 1910; while the wheat following clover produced 29.7 bushels in 1851 and 24.5 bushels in 1911.

The application of plant food (for the turnip crop only) in the same rotation over a period of sixty-four years increased the average yield of turnips from 1¼ tons to 17½ tons per acre, increased the yield of the barley following from 24.4 to 38.5 bushels, then increased the average yield of legumes from 1945 pounds to 4413, and increased the yield of wheat after legumes from 25 to 34.8 bushels, as compared with the unfertilized land.

If, again, we span the sixty years, we find that on the fertilized land the yield of turnips was 12½ tons in 1848 and 17½ tons in 1908; that barley produced 35.9 bushels in 1849 and 33.4 bushels in 1909; that clover produced 3½ tons in 1850 and 4¼ tons in 1910; while wheat yielded 30.3 bushels in 1851 and 38 bushels peracre in 1911.

Thus, the records show that during the last four years, following a sixty-year period, the plant food applied has increased the yield of wheat by 55 percent, increased the barley by 224 percent, and the clover by 340 percent; while the yield of turnips on the fertilized land was 49 times as great as on the unfertilized land.

With these facts in mind we may well consider the following statements from Whitney in Farmers' Bulletin 257:

"Apparently, these small amounts of fertilizers we add to the soil have their effect upon these toxic substances and render the soil sweet and more healthful for growing plants. We believe it is through this means that our fertilizers act rather than through the supplying of food to the plant."

"There is another way in which the fertility of the soil can be maintained; viz., by arranging a system of rotation and growing each year a crop that is not injured by the excreta of the preceding crop; then when the time comes around for the first crop to be planted again tne soil has an ample time to dispose of the sewerage resulting from the growth of the plant two or three years before. Barley will follow potatoes in the Rothamsted experiments after the potatoes have grown so long that the soil will not produce potatoes. The barley grows unaffected by the excreta of potatoes, another crop follows the barley, and the soil is then in condition to grow potatoes again.

"In other experiments of Lawes and Gilbert they have maintained for fifty years a yield of about 30 bushels of wheat continuously on the same soil where a complete fertilizer has been used. They have seen their yield go down where wheat followed wheat without fertilizer for fifty years in succession from 30 bushels to 12 bushels, which is what they are now getting annually from their unfertilized wheat plot. With a rotation of crops without fertilizers they have also maintained their yield for fifty years at 30 bushels, so that the effect of rotation has in such case been identical with that of fertilization."

If we turn to the Rothamsted data, we find the first recorded yield of wheat on the unfertilized plot on Broadbalk Field was not 30 bushels, but only 15 bushels; that the average of the first eight years was 17.4 bushels; that the best fertilized plot on bushels, but 37.1 bushels for fifty-five years; that, as stated above, the wheat grown in rotation, following a leguminous crop, has averaged not 30 the same field has averaged not 30 bushels, but 25 bushels on unfertilized land, and 34.8 bushels were fertilizers were applied for turnips three years before.

The following pertinent quotations are from Whitney and Cameron in Bureau of Soils Bulletin 22:

"In England and Scotland it is customary to make an allowance to tenants giving up their farms for the unused fertilizers applied in previous seasons. The basis of this is usually taken at 30 to 50 percent for the first year, and at 10 to 20 percent for the second year after application; but, in the experience of this Bureau there is no such apparent continuous effect of fertilizers on the chemical constitution of the soil."

"It appears further that practically all soils contain sufficient plant food for good crop yield; that this supply will be indefinitely maintained."

In Bureau of Soils Bulletin 55, by Whitney, entitled "Soils of the United States," issued in 1909, we find under the heading "Permanency of Soil Fertility as a National Asset," the following summarized statements:

"The soil is the one indestructible, immutable asset that the nation possesses. It is the one resource that cannot be exhausted; that cannot be used up."

"From the modern conception of the nature and purpose of the soil it is evident that it cannot wear out, that so far as the mineral food is concerned it will continue automatically to supply adequate quantities of the mineral plant food for crops."

"As a national asset the soil is safe as a means of feeding mankind for untold ages to come."

As stated in the beginning, I have planned to discuss the subject of plant food in relation to soil fertility; but I felt it a duty as well as an honor to be permitted to accept a place on your program; and I have placed before you some most important and trustworthy data bearing upon the question. I have presented some statistics for consideration in connection with the gravest problem which now confronts America; namely, the problem of restoring American soil and of maintaining American prosperity. I have quaoted accurately and fairly from the teachings of Whitney and Cameron; and I also submit for your information the following quotation from Director A. Hall, of Rothamsted:

"I cannot agree with Professor Whitney's reading of the results on the Agdell field in the least. The figures he quotes for wheat are hardly justifiable as approximations, and are in spirit contrary to the general tenor of the particular expetiment.....In my opinion the results on the Agdell rotation field are directly contrary to Professor Whitney's idea that rotation can do the work of fertilizers." (From Report of the Committee of Seven, appointed by the Association of Official Agricultural Chemists "to consider in detail the questions raised," published in full in circular 123 of the University of Illinois Agricultural Experiment Station.)

A thousand additional proofs of the practical value and of the evident necessity of supplying plant food in systems of permanent agriculture could easily be cited.

All long-continueg investigations and, likewise, all practical agricultural experience show that great reduction in crop yields ultimately occurs unless plant food is restored to the soil; and, as a rule, the chemical composition of normal soil is an exceedingly valuable guide in determining the kind of material which should be supplied in practical systems of soil enrichment and preservation.

Some farmers are like Gladstone. You will remember he got his exercise by chopping down trees.

Some farmers—a good many of them—are getting theirs like the man in the picture above.

Trundling one wheelbarrow-load after another for half a day from stable to yard is exercise all right. And what a "plug" it is to get a well-filled wheelbarrow up the plank gangway on to the manure heap—especially in winter.

50 lbs. pull on chain raises the load.

But have you time for this exercise?

Then why do it?

You wouldn't think of sowing or reaping in the old-fashioned way. Then don't make cleaning out stables the exception.

Load of 800 lbs. runs easily along the smooth track.

DILLON'S LITTER CARRIER lightens the labors of farmer's boy or hired man. It enables him to finish the stables in a fraction of the time before required.

A trim, well-kept barnyard, too, is the result of using a DILLON LITTER CARRIER. The bucket can be run out over the yard and dumped where desired.

A boy can work it. It can be fitted up without difficulty. The cost is the minimum for a first-class equipment. We have no Agents—you deal directly with the factory.

DILLON'S Litter Carrier

Figure it out for yourself. Get our free book.

Dillon's sell direct to the Farmer. There are no Agents and no Agents' profits. The price is the same to all, and lower than you would expect for such substantial and well-built equipment. **DILLON'S BOOK ON CLEAN STABLES** gives you an exact idea of what you can accomplish for a small outlay. Write for a free copy. 3

THE INFLUENCE OF THE COW

The index of the prosperity that prevails in any community is the manner in which the people live. If one goes into a section where the farms are poorly cared for there is a general air of indifference and carelessness and he finds that the homes of this vicinity contain few of the modern conveniences that make work easy and life enjoyable. He will find, if he looks over the farm stock, few of the cattle are well cared for and give evidence of the ability to yield a large profit.

If one goes into a community where cows are well kept, he will find the barns neat and attractive and on every hand there will be evidences of prosperity. The homes in this section will be equipped with every convenience that is available. There will be electric lights, automobiles, comfortable, roomy porches and well-kept, attractive lawns. This may easily be traced to the elevating influence of the dairy cow. There is many a farm home that can thank the dairy cow for relieving the occupants of much drudgery and thankless toil.

There are several reasons for this but chief among them all is the fact that the dairyman must be a business farmer. He must incorporate in his work a certain amount of system that takes the place of the endless round of uninteresting work that in the popular mind is so closely connected with farm life. The dairy farmer has a variety of interests. The fact that he has a constant income puts him on a little higher commercial level than his brother who depends upon the crop or upon an annual market of farm stock. The dairy farmer is a little more of a business farmer in the majority of cases than those whose interests are not centered in dairy stock and for this condition he may thank the dairy cow. His home is often more liberally supplied with comforts and his family is usually contented with farm life.

RECORD ATTENDANCE AT THE N. S. A. C.

The Nova Scotia Agricultural College opened its 1912-13 session on Tuesday, November 5th., last. The enrollment is 102 which is far in excess of any previous enrollment in the history of the college. At the corresponding date last year, the enrollment was 58 which number was increased to 78, being the highest number of students the regular course at the College up to that time. The attendance at the present course promises to reach well up to 125. The Nova Scotia Agricultural College has a limited consistuency in comparison with the other agricultural colleges in Canada, and besides, the course is a two years' course and the numbers in attendance are not increased by the presence of third and fourth year students. The attendance is therefore extremely good.

There is no queetion that until recently, Maritime agriculturists have been somewhat lethargic in the development of their industries, but of late years a new element has come into the agriculture of the East and the spirit of progress which is characteristic of the other parts of the Dominion has been equally characteristic of the provinces down by the sea. When the Nova Scotia Agricultural College opened its doors nearly eight years ago, there were many who had grave doubts as to its success. In the first year of its history, there were enrolled some thirty students in the regular course and some 68 students in the short course. The figures of 1912 are very striking in comparison to these, for in this latter year of grace, the attendance in the short course was 350 and as stated above, in the regular course, 102.

The best feature of all is that the students who are going out from the Nova Scotia Agricultural College are largely settling on the lands of the Maritime Provinces and are giving a most excellent account of themselves. Not only are they putting a new spirit into the actual tilling of the soil, but in Nova Scotia particularly, their influence is being felt in the establishment of new creameries, in the breeding of stock, in the growing of seed grains, and in nearly all lines which point to successful agriculture.

While the college has made a good start, it still has a great work to do, but if the people continue to rally around it during the next years as they have in the years gone by, there is no question but that much greater progress will be made not only in the college itself, but what is more important, in the constituency which it serves.

MAKE YOUR HEAD SAVE YOUR HEELS

Many a woman could save herself 50 or 100 or even more miles' walk, to say nothing of hill climbing, every year by slight changes in her house. The size and placing of rooms and the absence of step-saving devices are, perhaps, most to blame. Usually the worst, but least suspected, factors are the kitchen and the cellar stairs. The one is too big; and the other is too hard to climb. A kitchen big enough to serve both as laundry and dining room is an abomination. It not only makes for "muss," bad temper and uncouth manners, but almost always is a work-maker, not a work-saver. It should be so small that it cannot be misused. Everything should be on hooks or shelves within two steps of stove, sink, table, refrigerator and dumb waiter.

The truth of these statements is being realized by women more and more each year. Let us give an instance. A young farmer took his bride to the old homestead, which had become his. The family of two were to live in a house badly planned for eight. The dining room was big enough to seat 20 people comfortably. From the table to the kitchen stove was a journey of 15 steps by way of a hall and two doors. The kitchen, big enough for three modern ones, had neither pump, sink, dumb-waiter, refrigerator, nor even pantry. It was the last word in inconvenience.

The wife suggested changes, which the husband and his men made at odd times. A partition cut the dining room in two, and thus formed a bedroom and a living room. A doorway was cut between the kitchen and the parlor, from which latter a slice with a window was taken to make a commodious pantry separated from both rooms by swing doors. A window was cut in the outside wall and the kitchen partitioned to form a laundry fitted up with everything needful. A water system was installed, and now the kitchen, as well as the laundry, has running water. It has also sink, dumb-waiter, refrigerator, and plenty of convenient cupboards, shelves and hooks.

Hundreds, nay, thousands, of farm homes can be improved by such simple methods. The outlay for alterations need not be great. Work can be done at slack seasons. It will be a welcome change from regular farm operations. Plans should be made by the women who have to attend to the household. They should neither be hastily formed nor too soon adopted. A few weeks' or even months' thought and replanning may be very profitably spent. But anything—everything—should be done that will save woman's time and labor and that will make for more homelike and better living on the farm.

NAME THE FARM

What's in a name? There may be much or little depending upon the intelligence, the ambition and the progressiveness of its owner. Every respectable person honors his name, protects it from disgrace and likes to do good works of every kind. Every good man and woman has a cherished memory of the old home where childhood's days were spent and if that old home was on a farm, that farm should have a name that will distinguish it from all other farms of the county, so that the mere mention of the name will bring to the memory of all who knew it, its particular location, the personnal of its owners and the things it produced.

Nearly every other business house, factory or firm has adopted a name and a credit is established. Every farm is worthy of a name and every farmer can make a reputation and establish a credit for his farm and its products through intelligent, careful study and the adoption of approved modern methods of procedure.

A well chosen name lends dignity to a place and is a sort of trade mark which distinguishes it and its products; it characterizes its owner as a man of pride and stimulates all who are interested in it or its products to do and to be the best, and to make the products as good or better than those of any other.

We believe that a well selected name will furnish an incentive for better farming, that all implements, tools, vehicles, crates and products, whenever possible, should have the name of the farm indelibly stamped upon them; that it should adorn every entrance to the farm and be printed upon all stationery used on the farm. We believe that the name should relate to some distinct feature of the farm, its location, topography or products.

FEWER ACRES---BETTER TILLED

The desire of men to own land is commendable, but if this desire were modified to suit their conditions it would be better. Too many men buy too much land and encumber themselves with debts too heavy, and the interest ruins them. With intelligence a small farm will accomplish far more, when the owner is free from debt, than will a large farm to secure which a farmer 'swamps" himself, and makes it impossible for him to pay the purchase price. The "Little Landers" in California are teaching the world something worth learning, and all over the country there are men who are doing well with small farms, while their neighbors are doing poorly with large farms. With 40 or 50 acres many men can find independence and prosperity, while with a larger farm they will find themselves in the midst of ryin. Buy the small farm, and make intelligence and industry do part of the work. Othersare doing this, and you, man without a home, can do as well if you will.

We know a man who some years ago bought a farm of 50 acres. Most of the purchase price was on time. Although there have been hard years he has paid off the debt, and owns his home, and it is a real home, where he and his family have real comforts. He studies and makes his farm pay in so many ways that he hardly knows that it is a small farm, and it is all his very own. Were he consulted he would say it is better to own 50 acres than to owe for 100, and he knows, too, for he tried the other way, and lost his home. It takes more brains to make money on a small farm than on a large one, but he has brains, and after losing one home he has experience. This experience he willingly gives to others.

When the small farm is paid for it is then easier to buy another, and when two small farms are paid for, then the purchase of a larger farm is safe. There is something besides the large farm to make the purchase price upon. When men learn to buy small farms, and not burden themselves with heavy debts, they will do better, and more of them will pay for their homes.

NOTES

The man who buys a run-down farm may find much difficulty and many discouragements in making a living while he builds up the farm, yet the run-down larm may be cheaper than unimproved acreage that must be cleared, buildings erected and fences made before any returns are received. It depends upon the man as to which is the better investment. Both plans will prove a disappointment unless the buyer is fortified with perseverance and is willing to wait for his reward.

Simple Farm Drainage Operations.

"Well, Dad, when may we start seeding?"

"Can't just say. If it wasn't for the low spots, where the spare water collected when the snow went away, we might begin at once. The higher land is all right. I wish we did not have these little dips in so many of our fields."

Did you ever hear a conversation like the above? Perhaps not; perhaps you do not live in one of the parts of the country that are affected with undulating fields and "little dips" where the water delays spring seeding. If not—if your fields all drain off beautifully—this page is not for you. But if you do live in such a spot, you will be interested. What we have to suggest here has been tried out practically on many farms

Farm drainage is a very important subject. In saying this we have not in mind deep, expensive under-drainage, although that is very good for conditions such as they have in Eastern Canada; we are thinking of something simpler, that anyone may try. In this article we propose advocating the use of open drains, giving as far as possible free outlet to the water that lies in the little hollows in the fields of some parts of the country each spring. There are a great many of these spots in some districts, and on many farms, especially where the soil is heavy, seeding would be considerably faciliated by over coming the inconveniences that they present. Not only would the seeding in many cases, be done quite a good deal earlier and in much better condition, but to have these spots drained properly would also be to insure a smaller admixture of green grain in the crop at the time of cutting, and, consequently, higher grading.

In deciding upon the kind of drain to use in letting the water out of such places, there would be a number of factors to consider. Some of these would be the depth of the dip, others the lay of your land, and so forth. A pretty fair drain to many of the slightest of these depressions may be made by use of the plow, simply throwing out a good deep furrow or two each way, late in the fall. This, of course, leaves the soil alongside, and in the spring much of it will cave back again, but a little attention in the way of plowing the same place each year will eventually make a fair waterway.

To drain a decided depression is a very much larger task, and here again the tendency for all trenches through the loose soil to become filled up is the great difficulty. A pretty fair outlet may be made, but if the plow, harrow or seed drill are driven across it continuously, a good deal of soil will be filled into the depress; the water and the wind will also add to the work accomplished by them. This means that some work will need to be put upon these outlets each year to keep them open. The writer has seen very good drains made by the use of a scraper; either the wheel or the scoop scraper will do efficient work in this connection. When the low place of slough is close to the ridge through which you are working, it is a good plan to draw the dirt which you excavate from the trench into the low places. When the low places are too far removed from the place of operation, it is well to haul the dirt off to both sides and have it so distributed that it will be level, and in this way the best of conditions for natural surface drainage into the drain will be provided. It is most important that the sides of the ditch should not be cut square, because such a trench would be very inconvenient, and, besides racking farm machinery and implements, it would be killing to both driver and horses. Such places should be made, if possible, to help farm operations rather than to hinder them. In order to have a ditch that will not prove to be a nuisance rather than a benefit, it can usually be made longer and probably crooked, so as to avoid places where deep cutting is necessary. In other words, follow natural depressions.

When making such a drain it is necessary to work the scraper so that part of the soil taken out will be put on both sides of the ditch. The ground should be so levelled off at the sides that no lumps or hollows remain to shake the life out of everything that comes along. By using a scraper the sides of the ditch or drain is never pronounced, and, consequently, the field is left in a condition that will allow cultural methods to be done throughout the entire field without any extra turning, etc.

It is quite possible to do most of the draining that will be found necessary on the average sized farm in the month of November when plowing is pretty well over on account of frost. Then of course every opportunity should be taken during the period when the plowing is stopped in the mornings by the frost of the previous nights. Such mornings are just the time for using the scraper upon soil that has been loosened up by the plow the night before.

We know that many farmers are too busy this fall to give any thought to this matter, but probably there are others who can follow this suggestion.—N. W. Farmer.

Rules for Cutting Woodlots.

When timber is ripe the harvesting may be done by taking a few trees here and there, or by clear cutting part or all of the woodlot. But when making an improvement cutting, the object of which is to help the growing timber, the number of trees removed should not be great. It is impossible to give definite rules as to how much can be cut safely; this is a matter of judgment. The following suggestions from a recent reading course leaflet of the New York state They apply to improvement cuttings, not to harvesting of ripe timber:

1. Do not give a young tree so much room that the lower part of its trunk will not be cleaned of branches. These is no danger that new branches will start out on those parts of the trunk that will have been cleaned of limbs. 2. Even after the tree is well cleaned, do not give it so much room that it develops a wide-spreading top instead of a compact one. 3. Do not make an opening so large that it will not be filled by the surrounding crowns in a few years, otherwise the soil may run wild. 4. Since an opening should not be very large, it is a good plan not to cut two trees whose crowns adjoin unless there is a special reason for doing so. 5. Do not thin so severely that on a clear day you will see more than one-third of the ground with the bright sunlight reaching it; this sunlight should be in small patches here and there. It is perhaps well to repeat that these suggestions do not apply when timber it being harvested.

Improvement cuttings should be repeated frequently as there seem to be many trees that need to be helped by thinning. It is usually not necessary to do this oftener than once in five years.

A special form of thinning is often advisable where sprouts coming from a stump are using a part of the water and food taken up by the roots of the mother stump. By thinning the sprouts the rate of growth of those remaining can be greatly increased. No rule can be given as to how many sprouts should be left on each stump; this will depend on how close together the old stumps are, and how vigorous the sprouts seem to be. The aim should be to leave enough trees so they will shade the ground thoroughly within a few years, and not to make such large openings that the trees will not be cleaned of their lower branches. Usually from one to three sprouts are left on each lump. Such thinning also tends to make the sprouts straighter if too closely crowded, they are likely to twist into every little opening.

The thinning should not be done until the sprouts are several years old. If done when they are one or two years old, much of the benefit of the thinning may be lost, because a second crop of sprouts may spring up and almost overtake those of the first crop. If the thinning is not done until the sprouts are five years old or more, there is still a possibility that a second crop may start; but the first crop will have such a lead that they should quickly crowd out the younger ones.

Building Inexpensive Ice House.

Perhaps at this time of year a description of my ice house may be of some assistance to some who contemplate building. My ice house is situated on the south side of a hill. I dug into the hill so that on the north end the ground was 3 or more feet higher than one on the south end of the building. In this way it is much easier unloading, as the doors are on the north end, and in unloading from a sled you can put in your layers of ice before you are any more than even with the sled. It is somewhat harder for a team than it would be on level ground, but that is what we keep them for.

The bottom of the building is covered 1 foot or more with sawdust, thereby furnishing good drainage, which is one of the most important points in the storage of ice. The frame is 2x8-inch plank, set up straight without sills of any kind. each one has a good flat rock underneath it. In place of the sill in this case it requiret 24 of these, as the dimensions of the house are 14 feet square and 10 feet high. This makes six 2x8's on each side.

SAWDUST USED AS SIDES

These 2x8's are boarded on each side, and the place between is filled with sawdust to the plate. It has a pitched roof with six 2x4-inch rafters on the side, making 12 ralters. These with the four plates (2x4-inch and 14 feet long) are all the heavy stock required. It will take about 1400 feet of boards to board the roof and both sides of the studding. I purchased my lumber on the stump and cut it so there was not much waste. As the boards were 14 feet long, there was not any loss or extra expense of nails. I estimate the entire cost of this house was not over $50, including everything, and it will take 49 cakes of ice cut on a layer cut 20 inches square, or 36 cakes on a layer cut 22 inches square. This last size leaves a place between the boarding that has to be filled with sawdust, and I think as a whole I prefer cutting the ice 20 inches square.

We estimate the building to hold 35 to 40 tons of ice. It has been in use for 15 years with satisfactory results. The year this house was built it was the first of January before a stick of the timber was cut, and we filled the house with ice before the roof was put on. I have no ventilator on the house, and have thought sometimes that one would be an advantage, but cannot complain with the keeping of the ice.

I have tried various ways of having the ice cut, and have decided the most satisfactory for a small farm is to have a plow such as advertised in the farm papers. It is not very expensive, and can be adjusted to a number of sizes. We mark it one way and plow it down deep the other way. The advantage of not plowing the first way very deep is if there should come a storm, especially rain, you lose all that labor. We do not put the plow in more than 3 or 4 inches the first way and about 6 inches the other way, and then saw in the grooves. If the weather is favorable it is not necessary to saw only every other cake, as with a good chisel the cakes will come apart easily.—N. E. H.

Disenfect the Home Stable.

In the first place the carcass of any animal that dies of a contageous disease should be destroyed by burning. Otherwise it shauld be buried deep and completely covered with quicklime. Anthrax, especially, is frequently spread by neglect of these precautions as birds, dogs, or other animals feed on the unburied carcass and distribute the germs. The stable which has housed an animal that died of a contagious disease should be subjected to rigorous, sanitary treatment. All the infected forage and bedding should be raked out and burned, the walls should be well soaked with water and then thoroughly scraped. All rotten wood in the floors, feed boxes or stanchions should be removed and burned. A noted authority has said: "Thorough cleaning will often make disinfectants unnecessary, but no amount of disinfection will take the place of cleanliness. To control contagious diseases, both cleanliness and disinfection must be employed."

Lime is one of the most efficient disinfectants, as it destroys organic matter as well as bacteria. To prepare milk of lime, add a pint and a half of water to each quart of quicklime to be slaked. By weight, use 60 parts of water to 100 parts of lime. One quart of the resultant dry powder can be mixed with four quarts of water. This preparation should be used as fresh as possible to spray the walls, partitions and floors of infected buildings. It should be put through a fine seive or strainer previous to using to prevent the clogging of the spraying nozzle.

Every stable should be whitewashed several times a year as this inexpensive process not only is a valuable means of disinfection, but also materially improves the interior appearance of the barn. The whitewash should be made from freshly-slaked lime, using the same proportions as in the case of milk of lime. The surface of the stanchions and mangers, together with the side walls and ceiling of the barn, should be brushed clean of dust. The whitewash should then be thoroughly sprayed over the stable by means of a hand-power spraying outfit.

Two coats of whitewash a year will keep the stable in excellent sanitary condition. There is no excuse for any farm stable exhibiting dirty, filthy walls, ceilings and stanchions when such a cheap corrective is available to remedy such conditions.

Smooth up the Roadside.

Most of our roads are fringed with a heavy growth of grass. The roadways are not more than 15 feet wide, leaving about that many feet on each side where the grass grows. Those margins are so uneven that it is not possible to cut the grass. It would be of much profit to the owner of the land to smooth those margins so that a mower could be used, and make a good quantity of hay. At the same time it would greatly improve the appearance of both farm and road. This could be done by a good plowing and harrowing. Sow timothy mixed with clover and brush in.

HORTICULTURE.

The Nova Scotia Injurious Insect Pest and Plant Disease Act, 1911.

ORDER IN COUNCIAL.

At the Government house at Halifax, the 25th day of October, A.D. 1912.

Present:—His Honour the Lieutenant-Governor-in-Council.

The Governor-in-Council, under the provisions of "The Injurious Insect Pest and Plant Disease Act, 1911," is pleased to make the following additional Regulations:

1. In these Regulations, unless the context otherwise requires—

"Provisional Entomologist" means the person appointed as such for the purpose of carrying out the provisions of "The Injurious Insect Pest and Plant Disease Act, 1911," or under the provisions of any other statute.

"Inspector" means a person appointed for carrying out the provisions of said Act and the Regulations made thereunder.

"Nursery Stock" means and includes all trees, shrubs, plants, vines, grafts, scions, cuttings and buds, but shall not include green house grown plants, herbaceous perennials and bedding plants.

2. No imported nursery stock shall be delivered to any importer or consignee within the Province of Nova Scotia unless the same is accompanied by a certificate signed by such Provincial Entomologist or other authorized government officer as is approved by the Secretary for Agriculture that the nursery or other premises on which the same was grown was inspected within the period between the fifteenth day of June and the fifteenth day of September next preceding the shipment thereof, and that said nursery or other premises were found to be apparently free from San Jose Scale and such other plant diseases, insects and pests as have been declared to be injurious to vegetation by the Governor-in-Council under the provisions of "The Injurious Insect Pest and Plant Disease Act, 1911," provided that any importation of nursery stock which has complied with the Regulations of the Department of Agriculture of Canada shall be exempted from the provisions of these Regulations.

3. No common carrier, express company or other person, firm or corporation shall send, bring or cause to be sent or brought into the Province of Nova Scotia, for delivery within the Province, any nursery stock unless the certificate mentioned in the next preceding Regulation, or a duplicate thereof, is attached to each parcel or bundle thereof; provided, however that if such nursery stock is contained in a sealed car containing no other goods, such certificate may be attached to the car.

4. Every person who imports nursery stork shall give notice to the Provincial Entomologist, Agricultural College, Truro, within five days of giving the order for the same, and shall again notify the Provincial Entomologist on the arrival of the shipment in Nova Scotia. Notice shall also be given to the Provincial Entomalogist by every common carrier, express company or other person, firm or corporation bringing nursery stock into Nova Scotia for delivery within the province immediately such nursery stock is received. Such notice shall include the name of the consignor and consignee, the points of origin and destination, the name of the company or person carrying the nursery stock, as well as the nature, quantity and origin of the same.

5. (1) No nursery stock shall be brought into Nova Scotia for delivery within the province except at or through the ports and during the periods respectively hereinafter mentioned; that is to say:

Middleton, Annapolis County, from March 15th to May 15th, and from October 7th to December 7th;

Truro, Colchester County, from March 15th to May 15th, and from October 7th to December 7th;

and at such other ports during such periods as may from time to time be prescribed by the Secretary for Agriculture.

The Secretary for Agriculture may prescribe, for the purpose of this Regulation, any port at which the use of a Dominion fumigation station is available;

(2) At the ports hereinbefore mentioned all importations of nursery stock shall be inspected and fumigated in the fumigation house provided for that purpose, and a certificate of fumigation will be issued by the Provincial Entomologist, and no nursery stock shall be delivered by any common carrier, express company or other person, firm or corporation unless such certificate has been obtained;

(3) Importations by mail shall be subject to the same Regulations.

6. There shall be clearly marked or otherwise indicated on every package of nursery stock intended for delivery within the province of Nova Scotia the port at or through which such nursery stock is to be brought, and all shipments of nursery stock shall be entirely at the risk of the shippers or consignees, the Government assuming no responsibility whatever.

7. If, on inspection, nursery stock or other vegetation or vegetable matter is found to be infected with San Jose Scale or any of the plant diseases, insects and pests as have been, or may hereafter be, declared to be injurious to vegetation by the Governor-in-Council, under the provisions of "The Injurious Insect Pest and Plant Disease Act, 1911, such nursery stock shall be destroyed to the extent deemed necessary by the Inspector, and in his presence, or, if required by the consignee, shipped out of the province at the expense of the consignee. All cases, packages and packing in which such nursery stock has been contained shall also be destroyed in the same manner.

FRED F. MATHERS,
Clerk of the Executive Council.

Home Canning.

Canning is one constant fight against bacteria. Drying fruits avoids this work of bacteria by excluding the moisture. To can fruits and vegetables we must annihilate all fermenting germs, as well as spores, and exclude all others by an air-tight container. We may illustrate this by corn as follows: If you throw corn out in the sun it will not damage; but put the sprouted grains out in the sunshine for a few hours and they die. Just so with bacteria. A little heat will kill most of them but the spores require a longer process. In canning vegetables we may easily kill the plants, but the spores are more difficult We must work constantly upon the total annihilation of these spores by the application of heat. It can readily be seen that heat might be sufficient to germinate the spores and kill them before they in turn could produce spores. This is a slow process; but it is used to advantage sometimes when one wishes to pack something fine out of raw material which is injured by high temperature.

Usually in fruits the processing is done in boiling water after the cans are sealed. By the work process is meant the application of the required heat to kill all fermenting germs. Vegetables require more heat and almost invariably are processed under steam pressure. Before the cans are entirely sealed they are as the canners term "exhausted." This is accomplished in several ways, sometimes by putting the goods in the cans hot, or by filling the cans with water, brine or syrup heated to a temperature of boiling water. The fruits or vegetables and pouring in cans are quickly sealed and the shrinking of the contents on cooling causes a partial vacuum which draws the tops and bottoms in, adding materially to the looks of the container.

In processing most fruits it is not necessary to use an extreme amount of heat; because they will keep without it and subjecting to heat breaks down the tissues, causes the cane sugar to be converted into glucose destroying flavor and injuring color. On the other hand most vegetables require steam heat. Corn for illustration requires cooking for 50 minutes at a very high temperature. As can readily be seen the steam canner is an absolute necessity in the canning of corn, while for fruits and tomatoes you can usually depend upon a temperature of 212 or the hot water machine. By the addition of sugar it is possible to raise the boiling point from 212 to 240 degrees Fahrenheit. The beginner should experiment with a few cans at first and by following the instructions of the home machines he will soon reduce the failures to a minimum. In putting up certain vegetables it is necessary to par-boil or as the canners term "blanch." This takes from them certain acids which though not causing fermentation, will make the vegetable "digest itself."

Canning is a very simple process. Perhaps one reason why many people consider it difficult is the manner in which the managers and "skilled process men" have sought to advertise their work by "secret process" and "new ways," etc.

The amount of fruits and vegetables, especially peaches and tomatoes that have gone to waste in the eastern part of our state this year cry aloud the importance and future of the home canning machine. To corroborate this we have only to mention that one bushel of peaches furnish the necessary amounts to fill from 18 to 20 of the three-pound cans. The reatil price of such fruit is from 20 to 35 cents each and the demand for the home canned product is good because of its high quality and purity.

The value of ripe fruits and vegetables being substituted on the dining board for greasy bacon is inestimable. The problem is how best to secure these the "year round" at the smallest expense of time and labor. So far the home canner is the nearest solution. All admit that the success made in Texas by the canning industry is a great step in the right direction, but only a step on the long road has been taken compared to the possibilities of the little home machine working in every neighborhood. It is our belief that this will do more to decrease the high cost of living than any one thing before the American people.—F. R. Phillips, Extension Department A. and M. College of Texas, at Cotton Carnival.

Keeping Cider Sweet.

Take a clean barrel and bore several holes in the bottom. Spread a felt cloth over the bottom and then fill the barrel with clean washed sand. After the cider has gone through the first fermentation rack it off with the filter, and as it runs from this, put it into clean barrels which have been sulphured. Bung the barrel tightly and keep it in a cellar or room where the temperature is between 40 and 50 degrees. When the cider is wanted for use, it should be drawn off into bottles or kegs as it will change quickly if barrel is drawn from daily.

Another recipe is to add from four to 12 ounces of granulated sugar to each gallon of cider, according as the apples are sweet or sour, when the cider in the barrel is in a lively fermentation. Let the fermentation proceed until the cider has reached the taste to suit, then add one ounce sulphite (not sulphate) of lime to each four gallons of cider. Shake the barrel well and let it stand three days, after which it should be bottled for use. The sulphite of lime should be dissolved in a quart or more of cider before it is put into the barrel.

Don't Experiment with Roofing

It pays to buy good roofing just as it pays to buy good machinery and to keep good stock. Good roofing has good records behind it, *not claims.*

NEPONSET PAROID ROOFING

has excelled the records of best shingles. A warehouse built in 1898 was torn down last summer with its NEPONSET Paroid Roof still in good shape. NEPONSET Paroid has outworn tin and metal time and again. It is bought by Governments, by Railway Systems—by farmers, because it has proved itself the most economical roofing. Buy NEPONSET Paroid next time.

Blue Print Barn Plans—FREE

NEPONSET
Proslate Roofing
makes a handsome red or green roof for houses.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well, either.

So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking,

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;

G. Y. MORRIS, Manager 1900 Washer Co'p'y.

357 Yonge Street, Toronto, Can.

Have City Conveniences

REPLACE the pestilent, draughty, dangerous and offensive out-of-doors closet with an in-doors closet which requires no sewer, no plumbing and no flushing system Have city conveniences in your home.

Safeguard Family Health

by installing a

"TWEED CLOSET" SANITARY and ODORLESS

"Tweed" Closets can be installed in the bathroom, cellar, or any other convenient place indoors, merely requiring to be connected by a pipe for ventilation with a chimney hole. "Tweed" Liquid Chemical, used in connection with Tweed Closets, is both a deodorant and a disinfectant. Many hundreds of Tweed Closets have been sold in Canada. Send for illustrated price list. Sold on 30 Days trial.

The Leopard Moth.

The leopard moth occurs in Europe and parts of Asia and Africa, and was probably accidentally introduced into America from Europe more than thirty years ago, being first noticed at Hoboken, N. J., and later spreading toward the north and east along the coast. At the present time it is found from Ashbury, N. J., to Lawrence, Mass., but has not been taken more than twenty-five miles inland.

The larvae or caterpillars cause great damage to nearly all kinds of shade trees by boring in the branches just under the bark and cutting large galleries, often across the grain, thus girdling them. Dead branches extending above the mass of foliage in the tree-tops are a sign of attack, and many twigs will be broken off or wither during the summer. The pest has been especially destructive to elm and silver maple trees in the coast cities and towns of Connecticut, but is not so abundant in the open country. It has caused much damage also in the cities of New Jersey, New York City, Providence, Cambridge and Boston.

The adult moths are dirty white, with semitransparent wings marked with metallic blue dots. These have an expanse of one and three-fourths inches in the male or two and one-half inches in the female. The larvae is yellow or dirty white, marked with brown or black dots, and about two inches long.

The moths appear about July 1st, the males being very common around electric lights, and the females lay eggs singly or in groups of two, three or four, in the crevices of the bark or near the buds. The larvae, hatching in a few days, begin to tunnel in the twigs, and by the end of the season are about one inch in length. They leave the small branches and crawl over the bark to enter larger ones, cutting large galleries in them and expelling the frass through round holes, which they soon close with silk webs. During October the borers go deeper into the wood, and remain through the winter two inches or more beneath the bark. They pupate in their burrows the second spring, and before the moth emerges the pupa works itself partly out of the opening, and the adult flies away, leaving the empty case protruding from the burrow.

There are few natural checks, only one parasite being known in this country and four in Europe. It is believed, however, that certain birds, especially woodpeckers, prevent the spread of the leopard moth in the open country. Many larvae are doubtless killed by the breaking off of the branches, which in cities are carted away and destroyed.

Removing infested branches; injecting carbon disulphide (bisulphide) into the burrows, and stopping the opening; probing with a hooked wire for the larvae; are some of the methods of control.

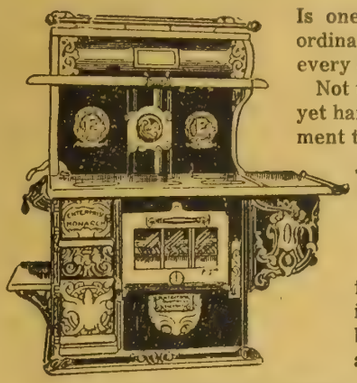
Planting species of trees not badly infested, like oaks, honey locust and sycamore, and especially those kinds that do not grow very large, and have a smooth bark; placing trees further apart, so that the larvae cannot easily crawl from one to the other; and keeping the trees well nourished and vigorous are the chief preventive measures.

Habit of the Blackberry.

There are few fruits equal to the blackberry for yield. These berries seldom fail. They do not bloom as early as the dewberry and some other fruits; blackberries seldom put out foliage until all danger of frost is past. Then the bearing quality of the blackberry is well known. An acre of blackberries, when there is a market, may be expected to yield considerable revenue. While the blackberry has a slight acrid or bitter taste that the dewberry and the strawberry does not have, it is liked by most people who eat fruits. Where the market is rather limited it is well to can blackberries, as this is a good way to save this desirable fruit. Blackberry plants may be transplanted any time during the fall after the foliage has fallen. Usually one should wait until frost, as the wood is then mature and the plants are better prepared to take root. Blackberries need cultivation and pruning for best results.

Don't waste your money by buying strengthening plasters. Chamberlain's Liniment is cheaper and better. Dampen a piece of flannel with it and bind it over the affected parts and it will relieve the pain and soreness. For sale by all dealers.

A Reasonable Range



Is one that is not too expensive for the ordinary family to buy, but good value for every dollar invested in it.

Not too ornate and hard to keep clean, yet handsome in appearance and an ornament to any kitchen.

THE ENTERPRISE MONARCH STEEL RANGE

fills the bill in this regard. That is why it is so popular and has been installed in so many well appointed homes.

It is—MODERATE IN PRICE, EASY AND ECONOMICAL TO OPERATE, A GOOD BAKER,
And—A CONSTANT SOURCE OF COMFORT IN ANY HOME

—Sold by all the leading stove dealers—

If your dealer does not handle it write direct for circular and full information.

GETTING THE PROFIT ONLY SHARPLES
Tubular Cream Separators Can Pay

John B. Cosing, whose prosperous farm home at Snelgrove, Ont., is shown above, recently discarded his disk-filled cream separator and bought the simple Sharples Dairy Tubular. He prefers a separator with double skimming force and without inside contrivances.

The great Canadian Pacific Railway Demonstration Farm, covering thousands of acres at Strathmore, Alberta, has discarded the complicated cream separator formerly used, and put in the remarkably simple, marvelously durable Sharples Dairy Tubular.

The Holy Angels Convent, at Athabasca Landing, Alberta, recently purchased a Sharples Dairy Tubular, in Edmonton. The Convent is one hundred miles from a railroad and the Tubular was carried to the Convent on a pack-horse. The Tubular was chosen by the Convent because it is the only separator so simple, durable and perfect that it can be relied upon in places where repairs are hard to get.

Those Using Tubulars get an extra profit no other separator can make. No wonder Tubulars are replacing others everywhere. Write directly to us, being sure to ask for Catalog 194 You will receive prompt and courteous attention.

DAIRYING.

Making a Dairyman of the Boy.

"Teddy is a real boy," said his proud father, "and it won't take long for him to prove it to you." Teddy took the hint and hurried into the barn which his father explained was his very own. Soon he emerged with a riding pony weighing about 800 pounds, and following close behind was a colt.

Teddy is less than six years old and you would scarcely expect that he could saddle his own pony for a ride, but in about a minute after he had disappeared around the house he came galloping toward us with his pony all saddled and bridled. I learned later that he leads the pony up to the porch and in this way is able to put on the saddle and bridle.

"I think my system is about the only one to keep a boy on a dairy farm," the father boasted. "Teddy has this barn all to himself. I help him haul the hay, but he takes care of the two horses and colt, hauls out the manure and does all the necessary work about the barn. That one-horse wagon there is his, and he never has any assistance in hitching the horse to it. Some of the neighbors tell me that Teddy will surely be killed if I allow him to ride as much as he does, but I believe that it is making a man out of him."

A short time before this conversation I visited the same farm and Teddy was the only "man" to show me around. The intelligent answers he gave to my questions and the knowledge he displayed regarding the farm operations show that there is not danger of his ever wishing to leave his father's dairy farm. He is a real boy, and a real dairyman. The success his father has had with him serves as a splendid object lesson for other dairymen who need the help of their sons at home.

The Best Cow.

A new phase of the profit question in dairy cows has recently brought to my notice. This question hinges on the number of days the cow was giving milk, for, while it is important for a cow to have a long milking season, there is no advantage in putting in the time milking her an extra month or two if she does not give sufficient milk to pay for the labor.

Few farmers have any idea at all of what they are making. The farmer in this way differs from the manufacturer or other business man, who spends large sums to install an elaborate system of cost accounts; few farmers can even tell the number of pounds of milk which each cow in the herd yields. It is the general opinion that the cow that gives the largest quantity of milk in the year is the best cow. But is she? There is considerable difference in the profits from the cow that gives six thousand pounds of milk in eight months and the cow that takes eleven or twelve months to produce the same amount of milk. Three or four months' milking is saved, and also considerable feed.

Mr. Stockhouse has been in mercantile life and he brought the business methods of the city store to the dairy in the country. He at once saw that the really profitable dairy cow was largely a matter of guess, notwithstanding the fact that her product was known daily and yearly. So he decided on his own account to learn what his cows really were doing from the dollars and cents point of view.

The herd is at present composed of twelve cows, which gave a total of 66,961 pounds of milk for the season, an average of 5,580 pounds of milk a cow. The highest yield was 6,417 pounds, while the lowest was 4,916 pounds. It is interesting to note the difference in the number of days that each cow was in milk.

The cow with the highest record was milking 256 days, a little more than eight months, while the second highest cow, only 65 pounds lower down the scale, took 325 days to produce the milk; so it was necessary to milk the second cow 69 days—two months—longer than the first in order to produce 65 pounds less milk, which makes her a more expensive cow than would appear at first sight. The fact is this cow, though second in quantity of milk, was not really second in actual profits. This is surely a new phase of the question.

In figuring the cost of milking a cow that comes some distance down the list should be second in profit, as she produced only 243 pohnds less milk than the second best, but took 58 days, or three months, less time to produce it. Now no man can afford to milk a cow 82 days for 243 pounds of milk; so this cow, though rated much lower, is really the second best cow in the herd; and on account of having been milked 13 days less time than the first grade cow, it is questionable if she is not the most profitable cow in the lot, notwithstanding the fact that she produced some 300 pounds less milk than the premier cow.

For the same reason the cow with the lowest record, 4,916 pounds of milk should really be higher up in the profit list, as she took only 244 days, just eight months, to produce it. Another cow that produced only 14 pounds more than the lowest placed cow took 24 days longer to produce the 14 pounds of milk and is surely a much less profitable cow, as a farmer cannot afford to milk a cow 34 days for 14 pounds of milk, not to mention the difference in the cost of feeding a milking cow and a dry cow.

The above are points seldom taken into consideration, as dairymen are too much in the habit of judging a cow by the number of pounds of milk produced, without considering the number of times a man has to be paid to sit down and milk the cow. Milkers that are good milkers are high priced men, and it does not pay to have them working for you eleven months when the same work may be accomplished in eight months.

I have never noticed that the experimental farms have taken up this phase of the question. True, in their dairy reports they give the quantity of milk yielded by each cow and the cost of keep, and weare allowed to draw our own conclusions as to the best cow; but nothing is ever said about the labor question. Dairy cows cannot be fed and milked for nothing. On a good dairy farm the herdsmen and milkers must necessarily be good, high priced men, and this labor question is quite an item and should not be left unconsidered.

This cow that took thirty-four days to yield fourteen pounds of milk more than her competitor will be generally rated as the better cow, because she gave a bigger yield of milk. Few people will stop to consider the cost of milking that cow thirty-four days, the cost of some extra feeding, the cost of manipulating her milk for market, etc., and all this work going on thirty-four days for fourteen pounds of milk.

It has been the custom of dairy writers to urge on their readers the importance of persistent milking. Persistence is all right, so long as it can be made profitable. The persistent milker is, after all, very much of a fake. So long as the cow continues to milk ten or eleven months in the year, and by her slow yielding persistency manages to pile up a few pounds more milk than her mate which is not so persistent, she is considered the better cow. But is she? Is not the cow that milks, say, only eight months and yields within a fraction of the eleven months' milker, the better cow? By all odds she is. This question is well worth consideration.—J. A. McDonald.

Breaking Heifers to Milk.

When it was the fashion to milk cows in the yard, nearly every farmer had some kicking cows that were not only unpleasant to handle, but were liable to spill the milk and upset the milker. I have never found it necessary to keep a kicker. Such a cow is often the result of an irritable temper in the one who breaks her.

I once broke 10 two-year-old heifers to milk in one season, and all were gentle cows when the breaking-in process was completed. The work was done in the yard, but the same plan will hold for the stable. I tied each heifer to the fence when I was ready to milk her. A rope was tied around the horns and kept there until the heifer was broken in. The heifer was petted to gain her confidence. I then sat down to milk. First I rubbed her udder and teats until she seemed to be calm, then began to milk.

It should be remembered that a heifer often has inflammation and soreness in the udder, and if she becomes irritated and kicks, the milker should not expect to calm her with the toe of his boot. He should crowd against her side and run his arm under her thigh and crowd it down enough to get a good hold on her leg, and then gently lift the leg with a firm grasp.

If she is obstinate, straighten her leg out and hold it so high that she cannot get the other foot down enough to help herself. Hold the leg until the heifer ceases to struggle and begins to tremble, then let it down gently and commence milking. The heifer will be docile and you will have a clear conscience. Two or three such experiences will be quite sure to establish relations between heifer and milker.

Last Pound Skimmed As Well as First Pound

The "Standard"

WE will guarantee that you can take a "STANDARD" cream separator and skim to the full amount of its capacity, even if the milk is not at its natural heat, and that the last pound will be skimmed equally as well as the first pound. After the skimming is done, open up the

Standard

bowl and you'll find the inside edges of the discs are not clogged with cream, nor the outside edges stuffed with foreign matter. That is because there is ample space between the discs and the bowl to provide room for more impurities than will accumulate in one hour's skimming.

This is one of the greatest improvements in cream separators in recent years. It was suggested by Professor J. H. Grisdale, Director of Dominion Experimental Farms, Ottawa, and carried to completion by STANDARD experts. It means ***CLEAN CREAM, ALL THE CREAM, NO WASTE.*** Our booklet explains this feature and many others more fully. Drop a post card to-day for a copy

Advantage of Having the Cows Freshen in the Fall.

The prevailing idea, or rather the idea that has prevailed in the past, that a cow will yield more pounds of milk in a year when she freshens in May, has been utterly exploded by hundreds of careful tests. To be sure, a cow that becomes fresh when on full grass will give a larger yield for a month or two than one that freshens in the fall, although on a properly balanced ration with ensilage as a base, there is less differenc even in this respect than most people think.

But to go back to the cow that became fresh in May. It is only a question of a month or six weeks' time until the fly pest appears, and this in itself will shrink the yield too far below the normal. In July and August the pastures are usually scant. The cow not only falls off in the yield, but she becomes thin in flesh, and while she may pick up some in the fall, the yield of milk does not increase to normal. A cow that has once materially fallen off in the yield can seldom be brought back to her maximum flow during that period of lactation; consequently spring cows usually go through winter on a decreased production, no matter what feed and care is bestowed upon them. Economically this is exactly contrary to what it should be. Milv products without exception have a higher price in the winter time than they do in the spring and summer. Obviously, therefore, it is in the winter that the yield should be the greatest. Winter feed, also, is more expensive than summer feed, so, as a general proposition, the income from the cows ought to be the highest when they are getting the highest price feed.

YEARLY MILK YIELD OF FALL-FRESHENING COWS GREATEST.

The cows that freshen in the fall start in with a good, fair flow, frequently, indeed, a maximum flow of milk. With good care and attention, which the farmer haos time to bestow during the winter; with good feed, which the silo, clover hay or properly cured corn fodder supply; with good, comfortable quarters, which the farmer has the time to be-building material make possible, a good cow, the only kind that a good, progressive farmer would keep, will maintain her yield practically all winter. Then in the spring, when the tendency would be for her to fall off, the stimulating effect of fresh, sweet grass will keep her up a couple of months longer, so that the total yield per cow is almost invariably greater in the case of fall cows than in the case of spring cows.

Winter dairying in advanced dairy communities is an established fact. Winter dairying on the part of the general farmer is bound to come.

In the first place, the general farmer who practices winter dairying will make more money out of his crops and he will make more money out of his dairy. He will have more money to spend, which means that he will have more money with which to buy farm implements and machinery.

The Milk Scales and Record Sheet.

Few dairymen think of the cows in their herds as anything but cows. They feed what they think the caw should have and take what milk she gives as a matter of course. The modern dairyman regards his herd as a market to which he carries his feed for sale, and he expects to get the full market value for his feed. Again the modern dairyman regards each cow in his herd as a special machine which must do certain work. Every loom in a cotton factory must work to its full capacity if the factory is to pay its owners a good dividend. Just so each cow in the herd must be watched so as to see that she does her full duty. It is a very easy matter either to over-feed or under-feed a cow, and a great many cows are to-day being either under-fed or over-fed.

The best way to study the herd is to put in every dairy barn a record sheet on which is recorded every pound of feed the cow is fed and every pound of milk she gives in return. A good rule to follow is to give a cow one pound of grain for every three pounds of milk. There are times when this rule is not best, but it can be taken as an average. Some will say that it is too much trouble to keep a daily record. To these we say keep the record for two days each week. This is far better than no record at all. At the end of the year the dairyman who has kept records for the first time will have many surprises. He will find that what he thought were some of his best cows did not pay him nearly so well as some which he thought not so good. He will find that some of his herd have been kept at a loss, while others have just paid for their keep.

As examples, herds in this state will be used. Herd No. 1 was kept at a profit of $1.24 per cow, while herd No. 2 was kept at a profit of $17 per cow. In another herd the best cow gave 250 more pounds of butter in one year than the poorest cow, and at a cost of only $8 more for feed.

These illustrations simply prove that, unless the dairyman knows what he gives his cows and what his cows give him, he is running a very uncertain business, and the milk scales and record sheet give a very handsome return for the trouble it takes to keep a record.—Prof. J. M. Burgess, South Caroline College of Agriculture.

"METALLIC" Ceilings and Walls

Some of the most imposing residences in our large cities are decorated throughout with METALLIC Libraries, Dining-rooms and Kitchens. It is an artistic yet fire-proof decoration, and will save you money by reducing your insurance rates.

If building a new home METALLIC should be put on without hesitation as you will save the cost of lath, plaster and paper, besides having a cheaper yet fire-proof and vermin-proof interior.

Or you can apply them to old rooms over the plaster. Then they are so easy to keep clean—simply wipe them with a damp cloth now and again and they look as good as when first put on.

When you want to change the color designs simply tint them over with the desired change.

Try METALLIC in your kitchen or bath-room, this is where its qualities are put to the severest test.

METALLIC is very artistic—hundreds of varied designs to select from—heavy beam effects, fancy scroll and panel patterns made to suit every room.

We shall be pleased to quote you if you tell us the size and shape of your ceilings or walls.

THE HORSE.

Cause of Heaves.

It is my belief, formed from causes of which I have had personal knowledge, that heaves in horses are some times inherited from their parents, and that not when so inherited, can be brought on by violent exertion when drawing heavy loads on a full stomach pressing against the lungs.

In regard to heridity, all doctors are agreed that tuberculosis, or consumption, in the human species can be inherited from the parents, or at least a greater tendency towards its contraction.

We had a neighbor who kept a large, well proportioned mare for raising colts. She had the "heaves" badly, and that was probably the reason he never put her in his team. She raised a fine looking colt every year, which from the time it was weaned was fed about all the grain it would eat (to hasten growth) until it was sold at the age of three years, or younger. The buyer mistakenly believing that the colt would continue to grow until five years old, as colts generally do that have not been crowded with grain, and that they would have a fine horse. They paid a good price for the colts, and an additional price for the growth expected, but which never grew. I was foolish enough to buy one of these colts. He was handsome and large for his age, but never grew a pound heavier after he was three years old, and showed the heaves soon after I got him. He had it so badly I sold for half the sum I had paid.

All the colts raised from this neighbor's mare, of which I have any account, showed the heaves as soon as they were put at work, or driven fast on the road.

A noted veterinarian thinks that horses with small chests are more liable to get the heaves, but my father had a horse that got the heaves after he became old, and he was large chested. I have owned two horses besides the one mentioned, that got the heaves, one of them so badly that she dropped dead in the road when being driven in a buggy. She was an uncommonly broad breasted beast. These two, and the one my father owoed, I think brought on the heaves by violent exertion. When drawing heavy loads they would put forth tremendous efforts, without urging. Every nerve, sinew and muscle in their bodies were put to the severest tension.

Men, when lifting a heavy weight, and horses when drawing a heavy load, fill their lungs with air and hold it until the supreme effort is over. This act constantly repeated fail to thicken the walls of the lung-cells or burst some of them with an over-loaded stomach prevents their ready expansion.

It is my opinion that some horses inherit the heaves (or the tendency for it) and others bring it on by over-exertion.

An English writer says: "The main cause of heaves is sharp work, after over-feeding, causing a rupture in the air cells."

Although the disease cannot be cured, it can be greatly palliated by feeding concentrated foods that do distend the stomach, and cause it to crowd against the lungs.—I. W. INGHAM.

A Two Horse Story.

I was standing near the curbing of a street in one of our neighboring towns some time ago, when an automobile stopped close to the sidewalk.

In a few minutes I saw a horse approaching, harnessed to a large dray. Seated high above the body of the vehicle was the colored driver.

The horse showed signs of uneasiness, and when very near the automobile it became quite fearful, so much so that the driver came down from the high seat, walked up to the horse's head and turned it towards the machine. He then petted the animal and talked to it in a way that had the effect of calming its fears, and soon it followed him a few steps after which he climbed again to his seat and the horse went on as if nothing had happened.

Soon another horse came along with a white driver, a strong muscular man, with a whip and an enormous amount of human will power to use it with. This horse, a fine looking animal, also balked when it neared the machine. The driver, instead of helping the horse overcome the fear by talking sensibly and patting it kindly, just whipped the horse severely, turning, it seemed, much of his angry will power into using the whip. Finally, after much time had been lost in beating the horse, he turned it around and, driving it again to the machine several times, te animal almost desperate, dashed by the machine and went up the street by no means in a very good humor.

Both horses were frightened and were unwilling to go near a thing that seemed dangerous and that they did not understand. Of course it was natural that they should try to avoid the machine.

Both men had a problem to solve—how to get the horse by the automobile. Each man got the answer to his problem, and each man was a different man and each horse a different horse afterwards.

The first man dsed his intelligence as kindly and as patiently as he could to make the dumb animal understand there was no danger in passing. Each animal seemed to understand, and horse and driver went by, each better for the experience; the man was kinder and had more faith in kind intelligence even when used upon the animal world, and the horse had overcome another fear and was hence a better and more useful horse with a better feeling towards his driver. This man solved the problem by thoughtful action.

The second man used his unintelligent human will power, and beat his horse by the automobile, without trying to strengthen by patience and kindness, the intelligence which the animal had already shown in being afraid of the strange looking object. This horse and driver went by also, but each worse off for his experience; the man was less kind and had even more faith in unintelligent brute force, while the horse still had fear of automobiles and a stronger fear at that, because he would expect a whipping whenever he would see one, and those fears made him a less reliable and less useful horse.

The Clipping of Horses.

Those who intend to clip their horses should set about their work without delay. It is satisfactory that the practice of clipping is growing in favour, for there can be little doubt that in the great majority of cases—something depends on the class of horse and the character of its work—it is a higly useful operation, enabling the animal to perform its work with less effort. The increased popularity of the practice is due, no doubt to some extent to the recognition of its beneficial effect, but perhaps quite as much to the fact that the handy machines now available make the work far easier. It is no light task to clip a heavy-coated animal when a pair of scissors was the best instrument available for the purpose, and it is not surprising that in the old days many grooms and owners were "convinced" that the operation was unnecessary. Human nature being what it is, it is natural that a man should give himself the benefit of the doubt when a troublesome and laborious bit of work is involved. The horse that is coarse bred, or is turned out, or not very carefully groomed, will require clipping earlier than the well-bred and well-groomed animal, for the growth of the coat is very much affected, not only by breeding, but by the management. It is safe to say, however, that most horses will be ready for the operation by the beginning of the next month, and a second clipping may or may not be required, according to circumstances, though in the case of the heavy horse it will probably be beneficial. After the middle of January clipping should not be carried out again, or the production of the summer coat will be interfered with, and its appearance greatly damaged.

BENEFITS OF CLIPPING.

The horse that is unclipped sweats profusely, and the long hair acts just like a wet blanket around him when he gets cold again. The effects of

TESTIMONIALS

DEAR SIR :—I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR :—I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

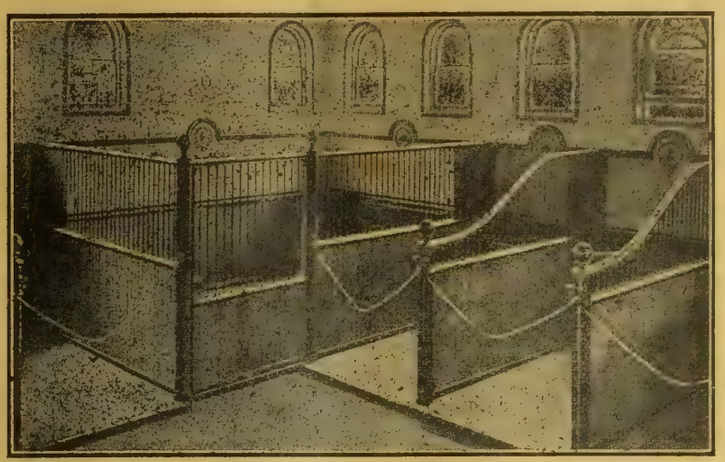
sleeping in a wet blanket in the case of a human being would naturally be expected to show themselves in the shape of colds, chills, and perhaps deeper-seated ailments, and this is precisely what happens in the case of the horse. It is very difficult to ensure that a thorough rubbing down after return to the stable is given; indeed, it is not an easy matter to wipe dry a very heavy coat, however willing to do his duty may be the attendant. It may not be so necessary to clip the slow-moving animal whose pace rarely exceeds a walk, but in all other cases it should be done, and rugs should be used to cover the animal when it is standing during its working period. The result of clipping at this season is sometimes astonishing— a listless animal that seems quite unfit for its work becomes sprightly and energetic. It is, indeed, quite as reasonable to expect a man to dig or engage in violent exercise while he is clothed in furs or a heavy overcoat as to expect the horse to work properly with his winter "suit" on. The matter, perhaps, only needs to be put in this way to make the reasonableness of clipping evident to owners, and fortunately the task is now so much lighter than formerly that the objections of the groom or attendant are not so pronounced as they used to be. At our agricultural shows interested crowds may be seen watching the shearing of the sheep; the exhibitions are not held at the period when horse clipping is practicable, but the value of the demonstrations is quite as great to the horse owner as to the shepherd and his master. Appliances worked by electricity or other power and by hand, appliances intended for the use of a man with a large number of animals to deal with and for him who has but a few are offered in variety, and the prices are reasonable. With such facilities there is reason to expect that the practice of clipping horses will grow in favor year by year, and it is a matter of congratulation that an operation which works so greatly for neatness and convenience should also be one which acts beneficially upon the health of the animal concerned.

BT HORSE STABLE FITTINGS



BT IRON GUARDS
IRON STALL POSTS
HAY RACKS
Adjustable Mangers

They make a durable, permanent job of your stable, add greatly to the brightness and appearance; when everything is considered they cost no more than wood fittings. A post card brings catalogue by return mail.

THE BT IRON GUARDS are made of 1-2 Inch steel rods secured in a heavy frame. They cannot be broken or disfigured in any way by the horses—once in place they never need repairing. The open construction of the iron guards allows the sunlight to flood every corner of the stable, making it bright and attractive. The guards do not collect dust or dirt, and so add greatly to the appearance of the stable.

THE BT IRON STALL POSTS are grooved to receive the stall partitions and so save much time in constructing the stable. They hold the partitions firmly, so that there is no possibility of the partitious ever going down. No amount of battering by the horses will ever disfigure them.

THE BT IRON MANGERS AND FEED RACKS allow the dust to escape from the hay. Our mangers can be adjusted to suit different widths of stalls. We make open and closed mangers in a variety of different designs, which are carefully illustrated in our Catalogue.

WRITE TO-DAY FOR CATALOG AND PRICES

Your stable when equipped with substantial Iron Fittings, looks good not alone when finished, but for years to come and all repair work is eliminated. The cost is not great. Horses bring a big price and it will pay you to stable them in bright, sanitary stalls.

BEATTY BROS., Ltd., 218 Hill St., FERGUS, Ont.

We also make Feed and Manure Carriers, Steel Stalls and Stanchions, Water Bowls, Etc.
BE SURE TO MENTION IF YOU WANT CATALOGUES.

Training the Young Horse.

When I was a boy, we thought it great sport to break the colts. The usual way was to let the colt run without even putting a halter on it until three or four years old; then get it into some corner of the stable and put on a halter, and often the same day put on a biting harness. This was simply an arrangement for pulling the colt's head up and its nose in higher than it was ever expected to be kept when at work or being driven. Then turn the poor thing loose in the yard and let it run for several hours.

We did not even think this was a cruelty to the colt; that was really inhuman, not to say wicked, because "a merciful man is merciful to his beast." There was no mercy in this, consequently it was wicked. If the colt is properly handled, there is no need of its being "broken."

The first thing is to secure the confidence of the colt; let it understand that you are its best friend. A lump of sugar now and then will be highly prized by the colt. Nothing loves sweets more than the horse, and a lump now and then to the colt will soon have it following you about, teasing for more. Accustom it, when only a few days old, to wearing a halter by putting on a light one for a day or two at a time and leading it around. When only a few weeks old, put on a light collar and back band to which the collar can be fastened, so as not to slip off when the colt puts its head down, and let it wear these for a few hours at a time. Before it is weaned, it should have a light harness put on and be driven by the side of its mother till fully accustomed to the lines. Its feet should be taken up and handled and pounded upon with some light thing until it is accustomed to have them handled in any way desired.

When a year old, it should be harnessed by the side of a gentler horse, preferably its mother, and hitched to some light vehicle without a load, and driven until fully accustomed to the use of the reins. Accustom it to robes and blankets, so that no matter where it sees them or how they may be thrown against body or heels, it will not be frightened. Never attempt to teach the colt but one thing at a time, and the first and most important thing to teach the colt is the word whoa. Let it understand that "whoa" means stop, at all times and under all circumstances. Never couple any other word with it. "Gee," and "haw," and "back" are important words and should be taught, but "whoa" is by far the most important, and if thoroughly taught will save many a catastrophe.

But in training the colt, whatever else you do or don't do, never lose your temper, nor speak harshly, or unkindly, or in an excited manner. If you get excited and lose your head, you must not blame your horse for doing the same.—L. S. Woodward in Maine Farmer.

Calculi in Mare.

Intestinal calculi, or stones, are a cause of colic, obstruction, inflammation, and, occasionally, of rupture of the bowels. They vary in the material of which they are composed, in shape, size, and in weight, from the size of a marble to a man's head, and in weight from an ounce to thirty or forty pounds. When small they are generally numerous and comparatively harmless, but when large there is rarely more than one or two. It is the large concretions that are dangerous as causing obstruction of the bowels, and as your mare has passed several small stones the indications are that those retained, if there are any, are small also, and, therefore, not dangerous. This is, of course, pure speculation, for no one can tell anything certain about the presence of intestinal calculi during the life of the animal, although they may be suspected. There is no legal obligation on your part to disclose the fact of the mare having passed a number of stones if you offer her for sale, but it is a bit shady to sell a horse to an unsuspecting purchaser for the reason that you are afraid to risk keeping it yourself. It is not quite in accordance with the "golden rule,-' which, however, rarely operates, even in ecclesiastical circles, where a horse deal is concerned. If you keep the animal as we have advised you to do, there is nothing that can be done to procure the expulsion of any calculi that may be present in the intestines, but something may, perhaps, be done by judicious feeding, or, rather, by the avoidance of certain foods, to prevent the increase in size of any that may be retained and to reduce the risk of new formations. Nothing, however, can be said about this without knowing something about the kind of "stones" passed—that is, of what the concretions are composed. If you care to send us for examination a specimen of those passed with the dung, which it is assumed have been retained as curiosities, we might be able to help you in this direction.—Pately Bridge.

Another Good Testimonial in Favor Of

VIGORA

"MR. J. B. MORIN:—I certify to have treated my mare for a chronic cough from which she suffered for two years, and when I commenced to use VIGORA she was so sick that she could nothing but the lightest work. Today she is perfectly well and can, as in the past, travel long distances quickly."

LIVE STOCK.

Big Shipment of High Grade Ayrshire Cows.

Tuesday, October 29th, was a red letter day for Ayrshire breeders in Howick and the adjoining district. The occasion was the shipment of the largest lot of high grade Ayrshire cows ever exported from Canada. The 217 cows, similar in color and type, together in one herd was a sight not often seen in Eastern Canada, and a number of spectators were on hand to see this large herd, which is being taken to the Brier Cliff Manor Farms, Pine Plains, N. Y., where certified milk is produced for the New York trade. The cows, 90 of which are in milk, the others due to freshen in the near future, together with a registered Ayrshire bull, Burnside White Cocade, purchased from Robert Ormstown, were loaded on 12 cars, and were taken through by Grand Trunk and New York Central Railways by special train for their destination, expecting to make the journey in 26 to 28 hours.

While D. T. Ness, was commissioned to make the purchase, yet the president of the company, Mr. Geo. W. Tuttle, or the manager, Mr. Sacket, personally inspected the animals before purchasing and supervised the testing with tuberculin and loading of the animals. To save delay at Malone, the port of entry, Dr. Main and U. S. Customs Officer Harman came to Howick to inspect the animals as they were loaded. A clean health bill was given with the animals, as there is no contagious disease in the district. Of 222 cows tested, only one reacted to the tuberculin test, which is a record any district may be proud of, as these cows were selected from the many choice herds in the counties of Chateauguay, Beauharnois and Huntingdon. The sellers were principally dairymen who produce milk for the Montreal market, and the going out of so many winter milkers will have a tendency to cut down the city supply. Many who sold cows did so reluctantly, but were desirous of helping to institute what may be a big trade in the future as city milk companies in New York find the milk from Ayrshire cows the most suitable for their customers.

True Value of Pedigrees.

Pedigree plays so large a part in stock breeding to-day that it is well to study the problem closely in order to ascertain its true worth; for it is quite possible to put a false value upon pedigree, just as the man who foolishly ignores it is standing in his own light. Pedigree becomes a fetish when it is held to enhance the value of a bad or indifferent animal when such a one is bought because his ancestors were good. Pedigree always enhances the worth of good stock. It may even cover minor faults in conformation or limb, but all the good ancestry in the world will not make a plain-shouldered or light-quartered bull a good one, nor a light-boned or unsound stallion a desirable sire. In the two latter cases pedigree acts as a veritable trap for the unwary. One has only to attend a few sales of stock to realize the truth. At most of these fixtures bulls that ought to have been steered and stallions that ought to have been turned out as geldings are offered, and bought by trustful people simply because of the fact that away back in their ancestry were some of the bovine or equine great ones of tne earth. The folly of such a proceeding can only be realized after the lapse of years. If a good sire leaves his impression on stud or flock, the evil influences of the bad sire are twice as potent. Scores of promising stocks have been ruined and hundreds more will be, solely because the owners have allowed pedigree to become a fetish. And the man who places no value on breeding records is just as foolish. We will remember an instance which proves in a striking way how disastrous this studied neglect of pedigree is. A certain gentleman farmer owned a large herd of Shorthorns. They had been his possession lor a number of years, and only the best Cruickshank bulls had been used. Every animal in the herd of over 300 was eligible for Coats' Herd Book if only pedigrees had been kept. At the dispersion sale a famous breeder remarked that failure to record and register the beasts had depreciated their value by at least £3,000. Young bulls which in the ordinary way would have been bought for South America had to go to English breeders for about half or one-third the price they would have made had not the late owner always always been of the opinion that "keeping pedigrees was too much trouble." And many fine cows and heifers that English owners of high-class herds would have been glad to buy had to be sold to ordinary farmers and dealers at low prices. This serves to show the folly of ignoring pedigree. But the greater sin of this age is the worship of pedigree as a false god. This is illustrated in no more striking way than by the insensate craze of many shire horse breeders for particular strains, utterly regardless of whether those strains will blend with those of the breeding stock which they possess. A stallion proves himself an impressive sire. He gets good stock when mated with suitable mares. The progeny win prizes, and are sold at big figures. Then breeders tumble over each other in the endeavour to secure nominations for the stallion himself or some of his sons. The result is chaos and disappointment, simply because the true value of records of descent was never understood. These seekers after the will-'o-the-wisp failed to realize that the great virtue of pedigree lies in its power to guide the owner of an animal in his breeding plans. Neglect of this is causing terrible havoc in the years we shall be bemoaning the loss of many strains which have done far more to make England's premier cart horse breed supreme than the much-boomed fancy sires of to-day, individually good though they be. All of which goes to prove that pedigree possesses no virtue in itself; that it is only of real value in the case of good, sound stock; and, above all, when used intelligently by the breeder as a seldom-failing guide to the production of the best. J. B. H. in Farm and Home.

Recommend John Bright for Live Stock Commissioner.

A strong deputation of stockmen waited upon the Hon. Martin Burrell, Minister of agriculture, on October 30th, and asked for the early appointment of a Live Stock Commissioner for Canada. This position was vacated by the resignation of Dr. J. G. Rutherford. Last summer Dr. Torrance was appointed to succeed him as Veterinary Director General, and took on the duties of Live Stock Commissioner temporarily until a new man was appointed.

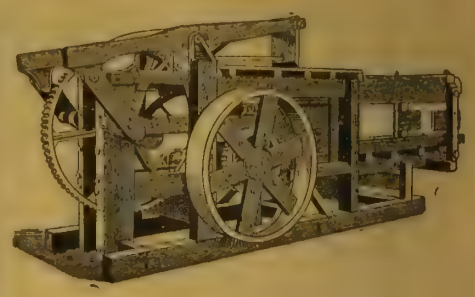
In urging the appointment the delegation strongly impressed upon the Minister the need for having a practical stockman and farmer as head of the Live Stock Branch, and recommended Mr. John Bright, of Myrtle, Ont., for the position. Each of the delegates spoke strongly in favor of his appointment, and referred to his many qualifications for the position. He is a well-known breeder and gas a knowledge of live stock from the ground up. Being a practical farmer, he is familiar with the farmer's needs and what should be done to increase his interest in live stock and the development of the industry. It was pointed out, too, that Mr. Bright, through judging at the leading exhibitions in Canada, and ocrupying prominent positions in the live stock organizations, had obtained a knowledge of the needs of the live stock industry of the Dominion that few men possess.

The following were the members of the delegation: Peter White, President, Dominion Shorthorn Breeders' Association and of the Eastern Ontario Winter Fair; Robert Miller, ex-Chairman, Record Committee, ex-President, Short-horn Association; Hackney Horse Society, Pony Society and the Dominion Sheep Breeders' Association; John Gardhouse, President, Dominion Cattle Breeders' Association, ex-President Shire Horse Association and Director of the Shorthorn Association and the Ontario Horse Breeders' Association; Robert Ness, ex-President National Live Stock Association, member of the National Live Stock Records Committee, and ex-President Council of Agriculture for Quebec; Hon. N. Garneau, member Council of Agriculture for Quebec, President General Breeders' Association, Quebec, and member Record Committee; Peter Christie, ex-President and Vice-President for Ontario of the Clydesdale Horse Association; J. E. Brethour, President Yorkshire Swine Association, ex-President and Director Dominion Swine Breeders' Association and member Record Commiteee; J. M. Gardhouse, ex-President Shire Horse and Sheep Breeders' Associations, Director Short-horn Association, member Record Committee, and Director Pony Society; John A. Boag, Vice-President Clydesdale Association, and Ontario Horse Breeders' Association; George Gormley, Director Clydesdale Horse Association, and Ontario Horse Breeders' Association; Geo. Robertson, President Eastern Ontario Poultry Association; Fred Richardson, Director Ontario Horse Breeders' Association, and ex-President Hackney Horse Society; Wm. Smith, M. P., President Ontario Horse Breeders' Association, Chairman of Record Committee, President National Live Stock Association, and Director Clydesdale Horse Association; W. R. Smyth, M. P., Captain Tom Wallace, M. P., and Herbert Lennox, M. P. P. —Canadian Farm.

YOU CAN MAKE MORE MONEY

working for and with your neighbors, during this season of the year, with our Hay Presses and Wood Cutters, than in any other way. There is an opportunity in every community for some bright and industrious farmer to make money as we say. Are you open to grasp such an opportunity? If you are, write us for prices and terms.

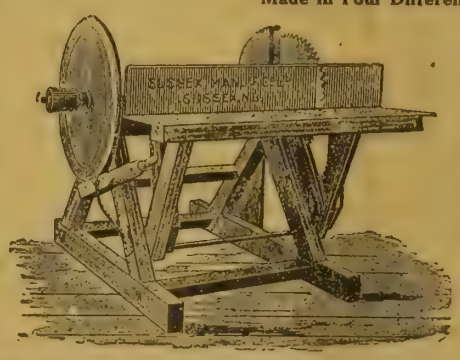
The Improved Trenholm Gear Hay Press



From the time the first Trenholm Hay Press was put on the market, it was recognized as a machine of exceptional capacity and strength, and the improvements from time to time since that date have placed it easily at the head as an ideal and eeonomical Hay Pressing Machine. The Bale Box is steel lined. The Side Springs which are thoroughly tested are made of the best quality Spring Steel. The Folder is properly located to do perfect work with these, and requires a very slight spring pressure to operate. The Large Balance Wheel weighs over 500 lbs, which adds greatly to the power in pressing. The large Gear Wheel in the centre is pinioned to the main axle, weighs over 500 lbs., and gives a very easy riding motion. The machine is operated with a Gasoline Engine, and will do more work with less power than any other on the market.

SUSSEX WOOD CUTTERS

Made in Four Different Sizes



We are offering these machines to the public with the belief that they are the best wood cutting machines on the market for the money. The Frame is made of the best seasoned hardwood, and well bolted. The Arbor is of the best turned steel, and runs in bearings made of the finest quality babbit. The Balance Wheel is a solid web and weighs 180 lbs. The Table is of heavy Steel Plates and indestructable. Wood Cutters are shipped with 28 in. saws unless otherwise ordered.

Remember we manufacture the celebrated Little Giant Thresher, The Sussex Root Pulper, Farmer's Feed Boilers, Grain Grinders, etc.

This Wife and Mother

Wishes to tell you FREE How She Stopped Her Husband's Drinking

By all Means Write to Her and Learn how She did it.

For over 20 years James Anderson of 193 Spadina Ave., P.B. Toronto, Canada, was a very hard drinker. His case seemed a hopeless one, but ten years ago his wife in their own little home, gave him a simple remedy which much to her delight stopped his drinking entirely.

To make sure that the remedy was responsible. for this happy result she also tried it on her brother and several of her neighbors. It was successful in every case. None of them has touched a drop of intoxicating liquor since.

She now wishes everyone who has drunkenness in their homes to try this simple remedy for she feels sure that it will do as much for others as it has for her. It can be given secretly if desired, and without cost she will gladly and willingly tell you what it is. All you have to do is write her a letter asking her how she cured her husband of drinking and she will reply by return mail in a sealed envelope. As she has nothing to sell do not send her money. Simply send a letter with all confidence to Mrs. Margaret Anderson at the address given above, taking care to write your name and full address plainly. *(We earnestly advise every one of our readers who wishes to cure a dear one of drunkenness to write to this lady today. Her offer is a sincere one.)*

The Show Ring Hog.

To make a good showing with hogs, fitting and careful growing is very essential. Most of the county fairs come late enough in the season so that the pigs may be grown out. The old hogs may need to be fed up a little to get the hair laying properly, but too much of this is not desirable. The young stock should all be carefully grown and fed. Good feeding helps to make hogs look well. The weak spots are covered up. That is why the expert showman highly fattens his stock, often in a ruinous manner.

Exercise.—It is a great mistake to feed hogs heavily without plenty of exercise daily. Grown as hogs usually are, little worry over this matter need exist, yet with heavy hogs this is very essential. Flabby hogs cannot stand hauling to and from fairs or stand the necessary handling at an exhibition.

Handling.—The real hog man knows his hogs and they know him. Working with them gives a familiarity difficult to gain in any other way, but wich is important at a fair. This applies to hogs of all ages. Boars should have their tusks removed so as to make them safe to handle and for a protection to other hogs that may be shown. This can easily be done by putting a mouth rope around his upper jam, snubbing him up to a post and with pinchers break out the dangerous tusks.

Hauling Hogs.—Frequently the heaviest hogs are lost going to fair. Hauling should be done in the early morning when it is cool. As open racks as possible should be used and as little crowding resorted to as is absolutely necessary.

Keep Hogs Presentable.—The pens at the fairs should be carefully bedded and kept clean and airy. Nothing looks more filthy than a hog in a muddy pen. When not in use feed troughs should be set outside the pen out of the way of visitors as well as the attendant. The hogs should be brushed down and fed regularly so that they will present a neat appearance.

Showing Hogs.—Hogs are shown with the advertising view in mind. Visitors should be treated courteously, one cannot tell when a prospective buyer is talking, besides one owes it to the public to be a gentleman, and it pays. Many foolish questions are asked, but these should be overlooked and answered with the good questions. In the show ring, present the hogs in the best condition and dress, and show them to the best advantage. At this time one should tend to his showing and that alone. One is displaying his products and should do so to the best advantage possible. Unless attended to properly hogs can get into very awkward looking shapes at such times and is not desirable.

Making Entries for Showing.—One should go over the premium list carefully and make all entries where he possibly will show and then keep records of entries made. This will avoid much regret as well as confusion at time of showing. Exhibitors frequently lose prizes because of failure to make entry. The fault lies with the exhibitor.

Feeding Baby Beef.

This is a more specialized industry than the feeding of heavier cattle, because quick gains and a high finish are essential. The most successful feeders of baby beef demand calves of the very highest beef type and the best individuals obtainable.

To be a first class feeder a calf should never lose a day's growth but should be pushed from birth. The feeding and care of the cow is therefore an important detail of successful baby beef finishing. At weaning time such calves should weigh from 450 to 500 pounds and should be vigorous and well conditioned.

When taken away from their dams they should be put on grass or succulent food such as silage, and such ground grain as they have already learned to eat. Much pains should be taken to prevent the setback at weaning time.

Get the calves on heavy feed as soon as possible and crowd them all the time. Good corn silage is almost indispensable to the most profitable handling of baby beef. Feed heavily on silage during the earlier part of the feeding season and push the grain more and silage less during the finishing period.

Ground corn and oats in the proportion of about one to four makes an ideal grain ration in connection with corn silage and some dry roughage such as clover or alfalfa. Silage can be depended upon for the bulk of the roughage, but dry forage of some kind should be kept constantly before the calves.

If the calves are put in the feed pen about November 1 begin to feed a little cottonseed meal early in January. Feed this on the silage, beginning at the rate of one-half pound per head daily and gradually increase until by April 1 as much as three profitable results. Plenty of water and salt, and reasonably good shelter are, of course, essential. All beef pounds can be fed. Oil meal is a desirable feed, but too expensive for cattle should have better shelter when fed on silage than in the old-fashioned dry feeding.

Calves of the type described can be finished in this manner at the age of 16 to 18 months and put on the market weighing from 900 to 1000 pounds. They usually command fancy prices.

Profits from feeding baby beef, as in any other kind of cattle feeding, depend on too many factors to warrant a general statement. With prime beef at the high level of recent years, however, the feeder who has reasonably cheap feed and who buys right can scarcely fail to pay out on the venture. Profits depend principally upon the skill and shrewdness of the feeder.

Dairy calves do not make the most desirable baby beef, but this industry nevertheless affords a profitable way for disposing of the surplus calves in a dairy district. By careful management and constant crowding, dairy calves can be fed into acceptable and profitable baby beef. Local circumstances must largely determine whether they should be fed for baby beef or sold as veal.—Breeders' Gazette.

A Suggestive Dairy Record.

I have felt for a long time that there was a place on a great many farms for a small flock of sheep. I have kept a few for several years, and since January 1, 1910, have reported the receipts from them, thinking that it might possibly be of interest to some. January 1, 1910, I had 12 grade Oxford Down ewes, and in the two years from then to January 1, 1912, I sold the following: Sheep and lambs $146, wool sold $52, won in premiums at county fair $35, making a total of $233.

I had on hand January 1, 1912, 21 good young ewe sheep, not one of which was over three years old. From them I had May 1, 1912, 26 nice lambs, several of which weighed from 50 to 60 pounds alive. These sheep have never had extra care from what any farmer could give them. They run on pasture in the summer, pasture with 40 head of young cattle, a large part of the time in a large and get their own living from early in May until snow comes in November. In the winter they run in a dry barn cellar, and are fed out of doors on the snow every day that it does not storm.

The early morning feed and on stormy days they are fed in a rack in the cellar directly from the barn floor. They are given good mixed hay, with considerable clover in it. For the past two winters I have fed a very little grain each day in a long trough out of doors, generally corn on the cob and oats ground together. The lambs commence to come in February, and for a while the sheep are looked after a little more carefully. Grain is put where the lambs can get to it away from the sheep, and in a few days they will learn to eat it. They have it every day until they go out to pasture.

I have not received any fancy prices for anything. The wool has been sold at the market price, and the lambs have always been sold to the local butcher by the pound dressed weight. As they have been good ones, dressing about 50 pounds each, in July and August I have received 15 cents per pound. The best ewe lambs have been kept each year, and some of the older ewes have been sold for breeders to other farmers, and as a whole the returns have been quite satisfactory for the labor and expense involved.—E. C. Buzzell in Maine Farmer.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

ASPIRATION.

I sat one day beside the flowing river
And watched it as it glided on its way,
So smooth and placid in its onward motion
Avoiding all delay.

Within its bosom was a moving purpose,
A longing wish to reach the mighty sea
And all its strength it gave to that one object
But yet now noiselessly.

And I have learned that somewhere in the distance,
Beyond the mountain and the spreading lea,
Still moving in tha? calm majestic sweetness
The river found the sea.

Channing Gordon Lawrence.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

"David," making his lips thin, by pressing them together, "if I have an obstinate horse or dog to deal with, what do you think I do?"

"I don't know."

"I beat him."

I had answered in a kind of breathless whisper, but I felt, in my silence, that my breath was shorter now.

"I make him wince, and smart. I say to myself, I'll conquer that fellow; and if it were to cost him all the blood he had, I should do it. What is that upon your face?.'

"Dirt," I said.

He knew it was the mark of tears as well as I. But if he had asked the question twenty times, each time with twenty blows, I believe my baby heart would have burst before I would have told him so.

"You have a good deal of intelligence for a little fellow," he said, with a grave smile that belonged to him, "and you understand me very well, I see. Wash that face, sir, and come down with me."

He pointed to the washing-stand, which I had made out to be like Mrs. Gummidge, and motioned me with his head to obey him directly. I had little doubt then, and I have less doubt now, that he would have knocked me down without the least compunction, if I had hesitated.

"Clara, my dear," he said, when I had done his bidding, and he walked me into the parlor, with his hand still on my arm; "you will not be made uncomfortable any more, I hope We shall improve our youthful humours."

(God help me, I might have been made another creature perhaps, for life, by a kind word at that season. A word of encouragement and explanation, of pity for my childish ignorance, of welcome home, of reassurance to me that it was home, might have made me dutiful to him in my heart henceforth, instead of in my hypocritical outside, and might have made me respect instead of hate him. I thought my mother was sorry to see me standing in the room so scared and strange, and that, presently, when I stole to a chair, she followed me with her eyes more sorrowful still—missing perhaps, some freedom in my childish tread—but the word was not spoken, and the time for it was gone.

We dined alone, we three together. He seemed to be very fond of my mother—I am afraid I liked him none the better for that—and she was very fond of him. I gathered from what they said, that an elder sister of his was coming to stay with them, and that she was expected that evening. I am not certain whether I found out then or afterwards, that, without being actively concerned in any business, he had some share in, or some annual charge upon the profits of a wine-merchant's house in London, with which his family had been connected from his great grandfather's time, and in which his sister had a similar interest; but I may mention it in this place, whether or no.

After dinner, when we were sitting by the fire, and I was meditating an escape to Peggotty without having the hardihood to slip away, lest it should offend the master of the house, a coach drove up to the garden gate, and he went out to receive the visitor. My mother followed him. I was timidly following her, when she turned round at the parlor door, in the dusk, and taking me in her embrace as she had been used to do, whispered me to love my new father and be obedient to him. She did this hurriedly and secretly, as if it were wrong, but tenderly; and putting out her hand behind her, held mine in it, until we came near to where he was standing in the garden, where she let mine go, and drew hers through his arm.

It was Miss Murdstone who was arrived, and a gloomy-looking lady she was. Dark, like her brother, whom she greatly resembled in face and voice; and with very heavy eyebrows, nearly meeting over her large nose, as if, being disabled by the wrongs of her sex from wearing whiskers, she had carried them to that account. She brought with her two uncompromising, hard, black boxes, with her initials on the lids in hard brass nails. When she paid the coachman she took her money out of a hard steel purse, and she kept the purse in a very jail of a bag which hung upon her arm by a heavy chain, and shut up like a bite. I had never, at that time, seen such a metallic lady as Miss Murdstone was.

She was brought into the parlour with many tokens of welcome, and there formally recognized my mother as a new and near relation. Then she looked at me, and said:

"Is that your boy, sister-in-law?"

My mother acknowledged me.

"Generally speaking," said Miss Murdstone, "I don't like boys. How d'ye do, boy?"

Under these encouraging circumstances, I replied that I was very well, and that I hoped she was the same; with such an indifferent grace, that Miss Murdstone disposed of me in two words:

"Wants manner!"

Having uttered which with great distinctness, she begged the favour of being shown to her room, which became to me from that time forth a place of awe and dread, wherein the two black boxes were never seen open or known to be left unlocked, and where (for I peeped in once or twice when she was out) numerous little steel fetters and rivets, with which Miss Murdstone embellished herself when dressed, generally hung upon the looking glass in formidable array!

As well as I could make out, she had come for good, and had no intention of ever going again. She began to "help" my mother next morning, and was in and out of the store-closet all day, putting things to rights, and making havoc in the old arrangements. Almost the first remarkable thing I observed in Miss Murdstone was, her being constantly haunted by a suspicion that the servants had a man secreted somewhere on the premises. Under the influence of this delusion, she dived into the coal-cellar at the most untimely hours, and scarcely ever opened the door of a dark cupboard without clapping it to again, in the belief that she had got him.

Though there was nothing very airy about Miss Murdstone, she was a perfect Lark in point of getting up. She was up (and, as I believe to this hour, looking for that man) before anybody in the house was stirring. Peggotty gave it as her opinion that she even slept with one eye open; but I could not concur in this idea: for I tried it myself after hearing the suggestion thrown out, and found it couldn't be done.

On the very first morning after her arrival she was up and ringing her bell at cock-crow. When my mother came down to breakfast, and was going to make the tea, Miss Murdstone gave her a kind of peck on the cheek, which was her nearest approach to a kiss, and said:

"Now, Clara, my dear, I am come here, you know, to relieve you of all the trouble I can. You're much too pretty and thoughtless,"—my mother blushed but laughed, and seemed not to dislike this character—"to have any duties imposed upon you that can be undertaken by me. If you'll be so good as to give me your keys, my dear, I'll attend to this sort of thing in future."

From that time, Miss Murdstone kept the keys in her own little jail all day, and under her pillow all night, and my mother had no more to do with them than I had.

My mother did not suffer her authority to pass from her without a shadow of protest. One night when Miss Murdstone had been developing certain household plans to her brother, of which he signified his approbacry, and said she thought she might tion, my mother suddenly began to have been consulted.

"Clara!" said Mr. Murdstone sternly. "Clara! I wonder at you."

"Oh, it's very well to say you wonder, Edward!" cried my mother, "and it's very well for you to talk about firmness, but you wouldn't like it yourself."

Firmness, I may observe, was the grand quality on which both Mr. and Miss Murdstone took their stand. However I might have expressed my comprehension of it at that time, if I had been called upon, I nevertheless did clearly comprehend in my own way, that it was another name for tyranny; and for a certain gloom arrogant, devil's humour, that was in them both. The creed, as I should state now, was this. Mr. Murdstone was firm; nobody in this world was be be so firm as Mr. Murdstone; nobody else in this world was to be firm at all, for everybody was to be bent to his firmness. Miss Murdstone was an exception. She might be firm, but only by relationship, and in an inferior and tributary degree. My mother was another exception. She might be firm, and must be; but only in bearing the firmness, and firmly believing there was no other firmness upon earth.

"It's very hard," said my mother, "that in my own house—"

"My own house?" repeated Mr. Murdstone. "Clara!"

"Our own house, I mean," faltered my mother, evidently frightened—"I hope you must know what I mean, Edward—it's very hard that in your own house I may not have a word to say about domestic matters. I am sure I managed very well before we were married. There's evidence," said my mother sobbing: "ask Peggotty if I didn't do very well when I wasn't interfered with!"

"Edward," said Miss Murdstone, "let there be an end of this. I go tomorrow."

"Jane Murdstone," said her brother, "be silent. How dare you to insinuate that you don't know my character better than your words imply?'.

"I am sure," my poor mother went on, at a grevious disadvantage, and with many tears. "I don't want anybody to go. I should be very miserable and unhappy if anybody was to go. I don't ask much. I am not unreasonable. I only want to be consulted sometimes. I am very much obliged to anybody who assists me, and I only want to be consulted as a mere form, sometimes. I thought you were pleased, once, with my being a little inexperienced and girlish, Edward—I am sure you said so—but you seem to hate me for it now, you are so severe."

"Edward," said Miss Murdstone, again, "let there be an end to this. I go tomorrow."

"Jane Murdstone," thundered Mr. Murdstone. "Will you be silent? How dare you?"

Miss Murdstone made a jail-delivery of her pocket-handkerchief, and held it before her eyes.

"Clara he continued looking at my mother, "you surprise me! You astonish me! Yes, I had a satisfaction in the thought of marrying an inexperienced and artless person, and forming her character, and infusing into it some amount of the firmness and decision of which it stood in need. But when Jane Murdstone is kind enough to come to my assistance in this endeavor, and to assume, for my sake, a condition something like a housekeeper's, and when she meets with a base return—"

"Oh, pray, pray, Edward," cried my mother, "don't acduse me of my being ungrateful. I am sure I am not ungrateful. No one ever said I was before. I have many faults, but not that. Oh, don't my dear!"

"When Jane Murdstone meets, I say," he went on, after waiting until my mother was silent, "with a base return, that feeling of mine is chilled and altered."

"Don't, my love, say that!" implored my mother very piteously. "Oh, don't Edward! I can't bear to hear it. Whatever I am, I am affectionate. I know I am affectionate. I wouldn't say it, if I wasn't certain that I am. Ask Peggotty. I am sure she'll tell you I'm affectionate."

"There is no extent of mere weakness, Clara," said Mr. Murdstone in reply, "that can't have the least weight with me. You lose breath."

"Pray let us be friends," said my mother. "I can't live under coldness or unkindness. I am so sorry. I

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous **Free Trial Treatment** of my well-known, reliable **Chronicure**, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. **Chronicure** succeeds where all else fails. **Chronicure cleanses the blood** and **removes the cause.** Also for a weakened, run-down condition of the system, you will find **Chronicure** a most satisfactory **general tonic** that makes you feel that life is worth living. Please tell your friends of this liberal offer, and **send today** for large free package, to **MRS. M. SUMMERS, Box B. 309—Windsor, Ont.**

Had Pains in Her Liver

Doctors Only Relieved Her For A Time.

When the liver is inactive everything seems to go wrong, and a lazy, slow or torpid liver is a terrible affliction, as its influence permeates the whole system and causes Biliousness, Heartburn, Sick Headache, Floating Specks before the Eyes, Jaundice, Brown Blotches, Constipation, Catarrh of the Stomach, etc.

Milburn's Laxa-Liver Pills stimulate the sluggish liver, clean away all waste and poisonous matter from the system, and prevent as well as cure all sickness arising from a disordered condition of the liver.

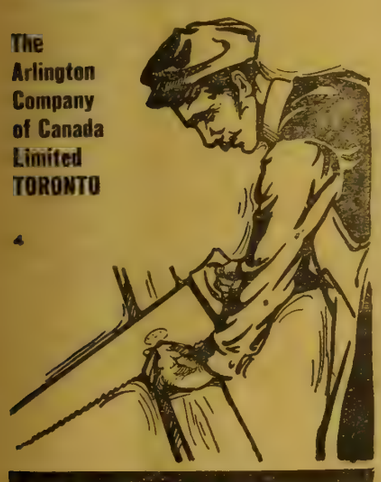
Mrs. Wesley Estabrooks, Midgic Station, N.B., writes:—"For several years I have been troubled with pains in the liver. I have had medicine from several doctors, but was only relieved for a time by them. I then tried Milburn's Laxa-Liver Pills, and I have had no trouble with my liver since. I can honestly recommend them to every person who has liver trouble."

Price, 25 cents per vial or 5 vials for $1.00. For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

"FOR THE MAN WHO WORKS"

Hard work is no excuse for an untidy appearance. A Challenge Waterproof Collar with its dull linen-like finish will keep you neat and well-dressed. Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for sample collar.

The Arlington Company of Canada Limited TORONTO



Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

"There could be no better medicine than Chamberlain's Cough Remedy. My children were all sick with whooping cough. One of them was in bed, had a high fever and was coughing up blood. Our doctor gave them Chamberlain's Cough Remedy and the first dose eased them, and three bottles cured them," says Mrs. R. A. Donaldson, of Lexington, Miss. Lor sale by all dealers.

have a great many defects, I know, and it's very good of you, Edward, with your strength of mind, to endeavor to correct them for me. Jane I don't object to anything. I should be quite broken-hearted if you thought of leaving—" My mother was too much overcome to go on.

"Jane Murdstone," said Mr. Murdstone to his sister, "any harsh words between us are, I hope, uncommon. It is not my fault that so unusual an occurance has taken place tonight. I was betrayed into it by another. Nor is it your fault. You were betrayed into it by another. Let us both try to forget it. And as this", he added, after these magnanimous words, "it is not a fit scene for the boy—David, go to bed!"

I could hardly find the door, through the tears that stood in my eyes. I was so sorry for my mother's distress; but I groped my way out, and groped my way up to my room in the dark, without even having the heart to say good night to Peggotty, or to get a candle from her. When her coming up to look for me, an hour or so afterwards, awoke me, she said that my mother had gone to bed poorly, and that Mr. and Miss Murdstone were sitting alone.

Going down next morning rather earlier than usual, I paused outside the parlor door, on hearing my mother's voice. She was very earnestly and humbly entreating Miss Murdstone's pardon, which that lady granted, and a perfect reconciliation took place. I never knew my mother afterwards to give an opinion on any matter, without first appealing to Miss Murdstone, or without having first ascertained by som(sure means, what Miss Murdstone's opinion was; and I never saw Miss Murdstone, when out of temper (she was infirm that way), move her hand towards her bag as if she were going to take out the keys and offer to resign them to my mother, without seeing that my mother was in a terrible fright.

The gloomy taint that was in the Murdstone blood, darkened the Murdstone religion, which was austere and wrathful. I have thought, since, that its assuming that character was a necessary consequence of Mr. Murdstone's firmness, which wouldn't allow him to let anybody off from the utmost weight of the severest penelties he could find any excuse for. Be this as it may, I well remember the tremendous visages with which we used to go to church, and the changed air of the place. Again the dreaded Sunday comes round, and I file into the old pew first, like a guarded captive brought to a condemmed service. Again, Miss Murdstone, in a black velvet gown, that looks as if it had been made out of a pall, follows close upon me; then my mother; then her husband. There is no Peggotty now, as in the old time.

I listen to Miss Murdstone rumbling the responses, and emphasising all the dread words with a cruel relish. Again, I see her dark eyes roll round the church when she says "miserable sinners", as if she were calling all the congregation names. Again, I catch rare glimpses of my mother, moving her lips timidly between the two, with one of them muttering at each ear like low thunder. Again, I wonder with a sudden fear whether it is likely that our good old clergyman can be wrong, and Mr. and Miss Murdstone right, and that all the angels in heaven can be destroying angels. Again, if I move a finger or relax a muscle of my face, Miss Murdstone pokes me with her prayer-book, and makes my side ache.

Yes, and again, as we walk home, I note some neighbors looking at my mother and at me, and whispering. Again, as the three go on arm-in-arm and I linger behind alone, I follow some of those looks, and wonder if my mother's step be really not so light as I have seen it, and if the gaiety of her beauty be really almost worried away. Again, I wonder whether any of the neighbors call to mind, as I do, how we used to walk home together she and I; and I wonder stupidly about that, and all the dreary, dismal day.

There had been some talk of my going to boarding school....Mr. and Miss murdstone had originated it, and my mother had of course agreed with them. Nothing, however, was concluded on the subject yet. In the meantime I learnt lessons at home.

Shall I ever forget those lessons! They were presided over normally by my mother, but really by Mr. Murdstone and his sister, who were always present, and found them a favorable occasion for giving my mother lessons in that miscalled firmness, which was the bane of both our lives. I believe I was kept at home for that purpose. I had been apt enough to learn, and willing enough when my mother and I had lived alone together. I can faintly remember learning the alphabet at her knee. To this day, when I look upon the fat black letters in the primer, the puzzling novelty of their shapes, and the easy good-nature of O and Q and S, seem to present themselves again before me as they used to do. But they recall no feeling of disgust or reluctance. On the contrary, I seemed to have walked along a path of flowers as far as the crocodile-book and to have been cheered by the gentleness of my mother's voice and manner all the way. But these solemn lessons which succeeded those, I remember as the death-blow at my peace, and a grievous daily drudgery and misery. They were very long, very numerous, very hard—perfectly unintelligible, some of them, to me—and I was generally as much bewildered by them as I believe my poor mother was herself.

Flour and Breadmaking.

(Continued from last issue)

PASTRY.

The soft flours are generally used for making pastry, and are, consequently, called pastry flour. It does not follow, however, that good pastry cannot be made from the stronger flours. In fact, experiments made in Macdonald Institute have clearly shown that it is possible; but more shortening must be used to get results obtainable from the softer winter wheat flour. The greater gluten content, expansive powers, and good colour of the stronger flours are not necessary requisites for pastry purpose; and, consequently, it would not appear to be good practice to purchase these more expensive flours and then use larger quantities of shortening in order to obtain the same results that may be secured by the use of the cheaper flours and less shortening. Practically the matter resolves itself into one of cost.

SHORT PASTRY.

1 lb. flour.
½ lb. shortening.
Ice-cold water.

The shortening may be a mixture of butter and sweet lard or sweet dripping.

If the fingers are cool, the shortening may be rubbed into the flour; otherwise, it should be cut into it with two knives until thoroughly mixed with the flour.

Mix into a dough with the ice water, using only enough to hold it together. It should be so dry that it will not stick to the bowl anywhere.

Turn out on the floured board, and knead only enough to make the ball smooth, when it is ready to cut into pieces for rolling out to line pie-plates, etc.

The quantity of shortening may be lessened for a plainer pastry.

FLAKY PASTRY.

1 lb. flour.
½ to ¾ cup butter.
Ice-cold water.

Rub two ounces of the butter into the flour. Cut the remainder into half-inch dice, and stir through the flour. Mix the water in with a broad-bladed knife, using only enough to hold the flour and butter together in shreds. If the quantity is difficult mix without cutting through the butter lumps, flour the board, lift out the part that mixes first, and proceed to mix the rest. The object is to avoid any further breaking of the butter lumps. Turn the mixture out on the board in a pile, pack it together with the hands, and roll out into a sheet. Use a broad-bladed knife, and fold it into three or four layers, tucking in all the loose shreds about the edges. Be sure it is not sticking to the board, turn it around, and roll Fold in half and set away to chill, out again. Fold and roll out again. if necessary, before rolling out to line pie-plates, etc.

This requires a hot oven at first to puff it, but a cooler one to complete the baking.

PUFF PASTRY.

½ lb. flour.
½ lb. butter.
Ice-cold water.

Wash the butter, form it into a flat round cake, and put it away to chill. Make the flour into a stiff dough with ice water, and knead until perfectly smooth. It should be firm enough to roll out without much contraction, but should not be dry. Roll into two pieces a trifle larger than the butter pat; place the butter on one, moisten the edge, place the other on top, and press the edges together. Put aside to chill. Roll it out in one direction only, until about three inches as long as board, fold into three or four layers, turn around and roll again in the other direction, then set aside to chill. Roll and chill twice more in the same way, but fold it in half the last time. It is then ready to roll out and cut into shape for baking.

The oven for baking should be rather hot at first, then cooler, to permit of baking the pastry thoroughly without burning. One-quarter of the butter may be replaced with lard.

The cook books indicate many different ways of making puff pastry, and all of them are good in skilful hands. Skill is attained only through practice and the judgment of experience.

It would seem important to exercise care, as follows:

1. To make the dough of just the right consistency.
2. To prevent any softening of the butter during the rolling operations. If the maker can work in a temperature just above freezing, no special chilling is necessary.
3. To roll lightly, but evenly, to avoid crushing layers together.
4. To regulate the oven carefully to secure the strong heat necessary to puffing the layers and yet avoid burning.

COMPOSITION OF BREAD MADE FROM DIFFERENT KINDS OF FLOUR.

It has been pointed out that many changes take place during the process of breadmaking; but while these changes affect the composition of the various groups of materials, as the proteids and carbohydrates, they do not materially alter their proportion to one another. The increased percentage of water in the bread naturally decreases the percentage of other constituents from what they were in the flour. The following table gives the average results of a number of analyses of bread made from different grades and different kinds of flour. All the breads analyzed, with the exception of that marked baker's bread, were made in our own flour-testing laboratory.

COMPOSITION OF BREAD.

Kinds of Flour	Moisture	Protein	Fat	Ash	Soluble Carbohydrates
Patent	36.80	7.60	1.80	1.25	52.53
Bakers' Grade	36.84	7.82	1.71	1.32	52.20
Standard patent 85 per cent.	37.40	7.74	1.71	1.27	51.88
Bakers' Bread	38.02	8.23	.43	1.13	51.63
Home-made Spring wheat	37.24	9.28	1.54	.92	51.04
Home-made Winter wheat	33.31	6.17	2.54	1.06	56.91

The strong flours always absorb the most water, consequently a greater weight of bread can be made from them than from the softer and weaker flours. Notice the low moisture content of the home-made bread from soft winter wheat, as compared with the same kind of bread made from spring wheat. With very low grade flour of the red dog type the water absorptive power is greater than it is in the better flours, but the loaf of bread produced is not marketable.

Some of the bakers' bread and the home-made bread from spring wheat were made with flour from wheat grown in the season of 1909. This accounts for the high percentage of proteids, as the wheat of the 1908 crop was much lower in this constituent. Incidentally, it may be mentioned that because of this increased proteid content and, consequently, gluten content, the flour from this year's crop of wheat is very much superior to that of last year. Naturally, the bread from the soft winter wheat is low in proteid, as the flour and wheat it is made from are low in this constituent.

The low fat content of the baker's bread is due to the fact that no lard or other fat materials were added to this bread. In all other cases some lard was used. The home-made bread from the winter wheat flour evidently contains the most fat, but this cannot be credited to the flour. It is due to larger amounts of lard being added in the process of making the bread. The high soluble carbohydrate, or starch content of the bread from winter wheat flour is naturally due to the comparatively low percentage amounts of protein and water.

It is evident that there is not much difference in the composition of the ordinary bread made from the higher grades of the spring wheat flours, but there is considerable difference when we compare this bread with that made from the winter wheat flour. We are frequently asked which of these breads actually furnishes the most nourishment to the body. To answer this question we made bread from four kinds of flour and analyzed it. The flours used in the work were the patent and bakers' grades, from Manitoba spring wheat, an 85 per cent. or standard patent, from the same grade of wheat, and 85 per cent. from all Ontario soft winter wheat. The bread was made in the regular way in our flour-testing laboratory—in fact, the loaves were taken from some of the regular testing work. In this work we used twelve ounces of flour for a loaf, and each lot of flour received exactly the same amount of yeast, salt, etc., and all the water it would absorb. The bread was weighed, dried, and the whole mass ground to an impalpable powder and analyzed. The average results of a number of analyses are given in the following table. As the actual size of the loaves, their colour, texture, etc., do not enter into the problem, these data have been omitted. It may be stated, however, that the bread was all of good quality. Naturally, the loaves from the Ontario flour were not so large, but the bread was a fair sample of that got from these flours.

PERCENTAGE COMPOSITION OF THE BREAD

	Av. wt. of loaf *grams	Water	Protein	Fat	Carbohydrates	Ash
Patent	502	36.48	7.92	1.76	53.42	1.05
Bakers'	506	36.75	7.39	1.71	52.81	1.32
85% Manitoba	501	36.10	7.93	1.73	52.92	1.33
85% Ontario	468	32.90	5.74	1.63	58.58	1.15

*28.34 grains in 1 ounce.

It will be seen from the above table that the various spring wheat flours produced about an equal weight of bread which was very similar in composition, while the Ontario winter wheat flour gave less bread with a lower water, protein, and fat content, and a considerably greater amount of carbohydrates. This is as expected, as the soft flour is starchy and poor in protein.

In order that we may make a closer comparison of the amounts of the various food constituents furnished by each 12 ounces of flour, the weights

BABY'S OWN SOAP

Bad Blood

is the direct and inevitable result of irregular or constipated bowels and clogged-up kidneys and skin. The undigested food and other waste matter which is allowed to accumulate poisons the blood and the whole system. Dr. Morse's Indian Root Pills act directly on the bowels, regulating them—on the kidneys, giving them ease and strength to properly filter the blood—and on the skin, opening up the pores. For pure blood and good health take

Dr. Morse's "Indian Root Pills

of protein, fat and carbohydrates contained in each loaf were calculated and are given in the following table. The fuel, or calorimeter value of each loaf was also calculated and is given in the last column of the table.

WEIGHT IN GRAMS OF FOOD CONSTITUENTS AND FUEL VALUE OF EACH LOAF OF BREAD

	Protein	Fat	Carbo-hydrates	Ash	Fuel valve
Patent	36.60	8.84	268.17	5.27	1399.
Bakers'	37.39	3.65	267.22	6.68	1382.
85% Manitoba	39.73	8.67	265.13	6.66	1388.
85% Ontario	26.91	7.63	274.15	5.38	1351.

It is generally assumed that, provided any given food is consumed as part of a well-balanced dietary, the number of calories of heat it will produce when burned, or, in other words, its fuel value, is the best basis for making a comparison of the nutritive value. Taking this as the basis, we have the figures given in the last column.

It will thus be seen that the soft wheat flour gave bread that contained approximately one-third less protein, or flesh-forming material, a little less fat, but more carbohydrates, and that it would furnish only 3.5 per cent. less energy than the bread from the spring wheat flour. From these figures we must conclude that, when eaten in the usual way as part of a mixed diet, bread from the soft wheat flour is practically equal in nutritive value to that obtained from the hard spring wheats.

(Continued in next issue)

In the Sewing Room.

Every woman should have a shirt waist pattern that has been fitted to her and is perfect. It is well to make this of cloth as it will see much service, not only for blouses, but for (orset covers, chemises and night dresses.

This pattern should indicate just how the sleeve is to be set in, just where the waistline comes and should have written on it the neck measure, the measure of the top of the collar, the waist measure, and the length of the sleeve. With a pattern of this kind it is often possible to make a waist without trying on at all.

Every woman who does much sewing should have a form. If several are to use the form make for each person a tight fitted lining of drilling (so it will not stretch) and get one of the inflated forms. If only one is to use the form a stock form can be used and the fitted lining padded where necessary. This is cheaper. The form is a great help in many ways.

The well dressed, well bred girl is never conspicuous and her clothes never attract undue attention on the street.

Floors and Floor Coverings.

Housekeepers are very generally falling into line and adopting rugs in place of carpets, for sanitary as well as aesthetic considerations. Even when floors are old, if they are not too uneven, they can be put into satisfactory condition to use with rugs. There are various brands of crack fillers, which can be applied to all cracks and holes so deftly that a hardly noticeable unevenness is left. After the filler has been applied, two and even three coats of paint are put on, allowing each coat to dry thoroughly before the next is applied. Housekeepers who have tried darker colors say that in painting the floor the color would be kept light, so not show readily.

that footprints and heel marks will

In the course of reading prepared for the farm home by the supervisor of the department of the College of Agriculture at Cornell, it is suggested that when an old floor is found to be badly warped, unepen, and with wide cracks, it is better to cover it with matting until a new floor can be afforded to take its place.

"Japanese straw matting in the natural buff color laid over a paper lining is excellent for this purpose. It is finely woven, inexpensive, smooth in surface, and easy to care for. A carpet sweeper or a soft cloth on a broom keeps it in good condition; but of course, like carpet, this must be taken up occasionally, as some dirt sifts through. Matting should be sewed together and the reversible kind should be used. Chinese mattings that are cheaper, but less durable, are not so artistic in effect. Many persons onject to the odor of straw matting on damp days. There seems to be no remedy for this. Perhaps we are over nice, for a hayfield or wet sod we call fragrant. The odor is clean and temporary; sun, air or an open fire will remove it.

The Cellar.

The cellar is generally a place for everything, where nothing is in its place. There is many ao old country house cellar that could be profitably overhauled and turned ibto a useful place of storage, and some, if enough, could be turned into workshops with a little outlay. Cellars should be well ventilated to prevent damp, and a window, if possible put in to dispel the gloom, or, in any case, several large gratings are necessary for the sweet air to circulate freely. If it can be afforded, a concrete floor should take the place of the wooden one, if there be such, or none at all as is often the case. Walls should be scraped and white washed, or limewashed, the windows cleaned and any woodwork hereabouts could with advantage be painted a light color, and thus add still more light. The coal cellar should not be used for the storage of rubbish or turned into an ash pit. Care should be bestowed on the wood cellar that no paper be allowed to gather there.—G. A. C.

Household Hints.

To Remove Wagon Grease From Cloth.—Rub with lard or unsalted butter, then after filteen minutes wash out thoroughly with hot water and soap.

To remove machine oil from cloth apply cold water and soda and spots will disappear.

To Remove Grease Spots From Silk —Place a piece of blotting paper under the spot on the silk. Scrape French chalk over it; lay a piece of thin paper over the chalk; press with a warm iron and the grease spot will disappear.

Keep the Cellar Clean.—Look after the cellar these days, and do not allow rotting fruit or vegetables, mould or mildew, to pollute the atmosphere. If the cellar is dark and damp and poorly ventilated, fruits and vegetables will decompose rapidly. Boxes of unslaked lime set about in dark corners or damp places will absorb moisture and sweeten the air.

Iodine Stains.—Iodine stains can be removed either from the skin or linen by the use of common household ammonia.

Spring Rain Good for Pillows.—For the heavy, lifeless pillows, hang them on the clothes line during a heavy shower of spring rain, leave on the line, and turn the feathers seperal times by working with the hands and when dry they will have new life. They should be allowed to get thoroughly wet through, and thoroughly dried.

Scorch and Mildew.—When pressing a colored dress and you have the misfortune to scorch it, take a silver coin, lay it flat on the scorched part and rub it briskly, and you will find the scorch disappear.

To remove mildew, wet the goods, rub common brown soap on the spot and scrape white chalk on it. Brush off the chalk when dry.

To Mend Hot Water Bags.—Apply several coats of liquid courtplaster to the holes, allowing each coat to dry before adding the next. The result will be waterproof and not affected by hot water.

Sir

This offer stands good for a few days only.

Here is that $90.00 Raccoon Coat which we are Offering you (Express paid) at $59.50 and remember the guarantee of this $4.000.000 Store goes with every Coat.

$59.50

Mail Order Dept.

Goodwins Limited
Montreal, Canada.

This RACCOON COAT is made from selected skins with high storm collar, quilted lining, leather arm shields. Sizes 38 to 46 inches chest and 52 inches long. Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is no easy task. But by patience and perseverence you can probably make out 5 or 6 of them. To the person who can make out the second largest number we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars. To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars. Should two persons send answers equally correct, the first two prizes will be divided between them, (each receiving $75.00) Should three send in equally correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you can't make out anything like a complete list, write us at once enclosing 2cent stamp for our reply. DO NOT DELAY, WRITE AT ONCE. Address, CANADIAN MEDECINE CO., Dept. 81 MONTREAL, QUE.

House Helps.

Ink Stains—Hot tartaric acid will take ink stains out of white cloth.

To Make Ferns Grow—To make ferns have a luxuriant growth feed occasionally with five drops of castor oil.

Keeping Children's Feet Warm—Put into the rubber a piece of batten enclosed in cheese cloth. This will keep the feet warm in winter.

For Biliousness—If a member of the family is suffering from sickness of the stomach try the white of an egg slightly beaten. It acts like a charm.

To Clean Silverware—To clean silverware let the pieces to be cleaned stand in buttermilk over night. Then in the morning wash with hot water and soap.

For Those Who Cannot Sleep—For a sick person who finds it difficult to go to sleep, try a pillow made of dried sage leaves. This is excellent to give one a drowsy soothing feeling

To Keep Paint Fresh—If a tin of paint has to be left open stir it thoroughly in order to mix all the oil then fill up with cold water. When the paint is needed pour off water and paint will be found as fresh as when opened.

TO LOOSEN A CAKE—When a cake sticks to the pan wring a cloth or folded towel in hot water, lay flat and place the cake pan on this for a few minutes. This forms a steam and causes to come out perfectly.

A Refreshing Odor For Invalids—Sprinkle a spoonful of ground coffee upon a fire-shovel upon which two or three live coals have been placed and immediately a sick room will be filled with a fileasant odor which is very refreshing to an invalid.

Sewing in Sleeves—When sewing sleeves in a waist this is a good rule to take for a guide. Measure back from shoulder seam one inch; crease the armhole at this point, and the spot exact,y opposite will be the place to put the under-arm seam of the sleeve.

To Clean Silk—Grated potato and soft water clean silk better than any other preparation. Use a large potato for a quart of water, and make a day or two before using. Use only the clear part of the water and let the silk be just dipped in and out, and then hung to dry.

Using Old Flour Bags—The 100-pound and 50-pound flour bags that one buys from the mills can be used for a variety of purposes. Wash them well, then boil in strong soda water to remove the lettering. They can then be used for pinafores, pillow covers, tea-cloths, etc., either as they are, white, or dyed according to taste.

To Restore Roses—Place roses in a large basin of water and hold each stem under water while the end is snipped off with a pair of sharp scissors. Keeping the stem under water excludes the air and the flower absorbs the water and begins to revive at once. Leave the flowers in the basin a short time and they will be as fresh as when gathered.

To Wash Woolen Goods—Take enough good soap to make a strong suds, cut it fine into enough water to cover the goods. Bring it to boiling heat, put aside to cool. Then immerse goods, leaving them for 24 hours. Then squeeze but do not wring out. Rinse in two or more cold waters, squeeze as dry as possible. Place in a plate to dry over register or in a cool oven.

Correct Sauces For Meals—With roast beef, grated horse-radish; roast veal, tomato or horse-radish; roast mutton, red currant jelly; roast pork, apple sauce; roast lamb, mint sauce; roast turkey, chesnut dressing and cranberry jelly; roast venison, black currant jelly; roast duck and roast goose, apple sauce; roast fowl, bread sauce; veal sausage, tomato sauce or grated parmesan cheese; boiled rabbit, onion sauce or black currant jelly.

To Prevent Icing From Running—Before putting icing on a cake wet it slightly with cold water. This will prevent the icing from running if it be a little soft. Then to prevent the icing from running down the sides, double a piece of stiff waxed paper and pin it to the cake closely, letting the band come about half an inch above the top of the cake. Do not remove the paper until the icing is set.

Mending Hot Water Bottles—Rubber hot-water bottles may be mended as follows: Cut one cubic inch of clear para rubber into small pieces and place in one pint of benzine, cover tightly, and leave two or three days or until the liquid is about as thick as honey. Apply this cement to the surface of the bag and the patch, which should also be of rubber. Join the two, press down evenly, and in a very few minates the mend will be perfectly complete.

The boy's appetite is often the source of amazement. If you would have such an appetite take Chamberlain's Tablets. They do not only create a healthy appetite, but strengthen the stomach and enable it to do its work naturally. For sale by all dealers.

Dish Washing.

Necessary utensils for dishwashing consist of dishpan, draining pan, dish cloth, clean dry dish towels, boiling water and soap.

Before clearing the dining table, prepare a place in the kitchen for the soiled dishes. All pots and pans should have been put to soak as soon as the contents were emptied. These should be scraped and piled and placed by themselves ready for washing.

Gather up the soiled dishes in a methodical manner; glasses by themselves, then silverware, cups, saucers and plates uniform in size in separate piles, scraping the bits of food and grease from the dishes before putting them in the dish water.

Fill the dishpan half full of hot soapy dish water. Have the draining pan at the left of the dish pan. Wash the glasses first, rinse, dry and set aside. Use soft towels for wiping and see that the glass ware is shining when put away. Wash, rinse and dry the silver in the same way. Be sure to use perfectly dry towels for the silver. Next the smaller pieces of china, then the larger pieces are washed and placed in the draining pan. Pour hot water over these and a little polishing with a dry towel will be all that is necessary.

Wash pots and pans and scald well before wiping. If steel knives are used they should be scoured.

Put away all dishes.

Empty the dish pan, put the rinsing water in it and use to scrub the clean table and sink. Wash, scald and dry the tea and coffee pot after each meal.

Usually after the midday meal the dish cloth should be washed in good soapy water, wrung out dry and hung to dry in the sunlight and fresh air if possible.

Clean the stove and teakettles. Wipe the teakettle off after each meal and very frequently wash it inside.

Empty the garbage pail and clean pail with the remaining suds.

The dish water should be kept hot and soapy enough to prevent a ring of grease on the pan. If the rinsing water is good and hot, fewer towels will be needed.

Kitchen Travels.

A convenient arrangement of the kitchen can be made to reduce the work considerably. Mrs. John A. Widtsoe, of the Utah Agricu,tura, College, has done some figuring on this. She estimated the distance that had to be traveled in a year in getting the meals in a house that she moved into to be 125 miles. Later she had a kitchen which was arranged after her own plan, and in getting the same number of meals in this for a year the distance traveled was reduced to 57 miles. This is certainly quite an item and deserves a good deal of study. The distances that need to be considered are those from stove to dining table, from stove to sink, from dish-cupboard to dining table, from sink to dining table, from work table and pantry to stove, from dish cupboard to stove and dining table. If this is given careful attention it will be found that without very much re-arrangement these distances can be cut down a great deal.

--I consider it almost criminal not to have a high stool in the kitchen," is the statement made by Mrs. Reno in The Farmer, and she continues, "And remember after you have it, use it all you can. Sit down to wash dishes, prepare vegetables, iron, churn, etc., as you will have to be on your feet enough anyway." The farmer has seats on all his machinery. He will do scarcely any work standing up. If he has an implement, as

FREE TO MEN

You Yourself Can Restore Your Vitality

VITALITY is the greatest power in the world. If I renew your VITAL VIGOR I restore you to full and complete manhood. No matter what your age, whether you are young or elderly, no matter what early indiscretion may have sapped your courage. If I resupply you with new VITALITY I give you the strength that all healthy, vigorous men possess. I know the source of this VITAL SUPPLY. My HEALTH BELT, with suspensory attachment, pours a great stream of VITALITY into your system hour after hour all night while you sleep. Thousands have said it immediately benefits and takes the pain and weakness out of the back from one night's use. No drugs, no medicines, no restrictions of any sort excepting that all dissipation must cease. The man who indulges an excesses and unnatural practices can never be other than a weakling, but if you promise me as man to man that you will be decent, take ordinary care of your health and then use my HEATH BELT every night for 60 to 90 days, I should then be able to do in your case exactly what all these other thousands of men have said I did for them. Please write for my booklet to-day. Never mind about purchasing a Health Belt now; first get into communication with me, read what my book says, then later, if we decide between us that you should have a Belt and if you decide that you want to use it, I will arrange for you to have one to wear until you are cured. My Health Belt is the greatest vitalizer the world has ever known. With special attachments it is a remedy for kidney, liver, stomach, bladder disorders, rheumatism. etc.

Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man. young or old, who would be strong in manly vigour. It is a word of hope, a carefully written, interesting booklet which should be in every one's possession. Therefore, send to-day. If in or near the city, call at my office. Hours 9 to 6

a harrow, which does not have a seat he does not hesitate to spend ten or fifteen dollars to buy a truck which has a seat on it and attach to the harrow so that he can do the work and ride. If the farmer's wife gave as much attention to reducing her work and making it easier as the farmer does it would help a great deal.

Sleep of Health.

A very famous doctor summarizes the secret of longevity in the following nineteen rules:—

1. Eight hours sleep.
2. Sleep on the right side.
3. Keep the bedroom window open all night.
4. Have a mat to the bedroom door.
6. No cold tub in the morning, but a bath at the temperature of the body.
7. Exercise before breakfast.
8. Eat little meat, and see that it is well cooked.
9. (For adults) Drink no milk.
10. Eat plenty of fat, to feed the cells which destroy disease germs.
11. Avoid intoxicants, which destroy those cells.
12. Daily exercise in the open air.
13. Allow no pet animals in living rooms—they are apt to carry about disease germs.
14. Live in the country if possible.
15. Watch the three D's—drinking water, damp and drains.
16. Change of occupation.
17. Take frequent and short holidays.
18. Limit your ambitions, and
19. Keep your temper.

Cure for Choking.

"Raising the left arm as high as you can will relieve choking much more rapidly than being thumped on the back," said one of the resident physicians of a local hospital. "This should be more generally known, for often a person gets choked while eating when there is no one near to thump him or her. Very frequently at meals and when they are at play children get choked while eating, and the customary manner of relieving them is to slap them sharply on the back. The effect of this is to set the obstruction free, so that it can be swallowed. The same thing can be brought about by raising the left hand of the child as high as possible, and the relief comes much more rapidly. In happenings of this kind there should be no alarm, for if a child sees that older persons or parents get excited it is very liable to become so, also. The best thing is to tell the child to raise its left arm, and immediately the obstruction passes down the throat."—Philadelphia Record.

International Emporium, Beebe, Que.

Well Known Separator Men Leave Sharples for Empire.

On October 31st, last, a considerable number of well known officers and employees of the Sharples Separator Company left the employ of that concern and joined the EMPIRE CREAM SEPARALOR COMPANY of Bloomfield, N. J. Almost without exception the individual membert of this body of men, trained in the cream separator business, now occupy with the EMPIRE concern the same position formerly held with the Sharples Company.

The following gentlemen, widely known to farmers, dairymen and local dealers throughout the country, are among those who made the change.

J. H. Colville, General Manager; C E. Stowell, Manager of the Chicago Office; J. B. Decker, Credit Manager of the Chicago Office; N. N. Spear, Advertising Manager; L. N. Somes, Manager of the Dallas, Texas Office; E. H. Fralick, Manager of the Portland, Ore. Office; Z. L. Wright, Southern Sales Manager; F. W. Knight, Eastern Trade Manager; H. E. McWhinney, Assistant Manager of the Chicago Office and Sales Manager for Kansas, Neb., Col., and Wyoming; Geo. P. Buttel, Sales Manager for Minnesota, Montana, North and South Dakota; E. S. VanNorwick, Sales Manager for Iowa and Wisconsin; H. L. Smith, Sales Manager for Indiana and Michigan; E. M. Zentmeyer, Sales Manager for Illinois and Missouri.

A number of traveling men and change. Those who have made the other employees have also made the change state that they had excellent reasons for so doing and that their expectations, based on their new association with the EMPIRE CREAM SEPARATOR COMPANY, have already been more than realized.

Implement Firms Change Hands.

An announcement of considerable interest to farmers and gardeners, as well as implement dealers, in the United States and Canada, is that which has been recently made of the purchase, by the well known American firm of Bateman Mfg. Co., makers of the famous "IRON AGE" implements, of the Wilkinson Plough Co., Limited, and the Toronto Pressed Steel Co., both of Toronto, Canada.

The two latter companies are well and favorably known throughout the Dominion for their line of ploughs of all sorts, ensilage and straw cutters, pressed steel pan and wheel scrapers, land rollers, wheel barrows, drag harrows, beet pullers, etc., which they have been manufacturing for some time.

The Bateman Mfg. Co., established seventy-seven years at Grenloch, New Jersey, U. S. A., also makes a widely popular line of garden and farm tools, potato diggers, hand ploughs, harrows, pumps, spraying outfits, etc., sold under the trade name "IRON AGE."

The Wilkinson Plough Co. and the Toronto Pressed Steel Co. will continue to make their goods in their original plants under the new organization, which is to be known as the BATEMAN-WILKINSON COMPANY, LIMITED, with headquarters at Toronto, Canada. In addition to their manufacture of "IRON AGE" impleformer lines, they will begin the ments. These latter will be distributed rapidly to the growing trade throughout Canada—a demand that has increased through the satisfactory service rendered by the "IRON AGE" farm machinery.

Dealers and customers may secure full information regarding the "IRON AGE" line by writing for booklets and descriptive literature to the Bateman Mfg. Co., Grenloch, N. J., U. S. A.

WILL GIVE $500 TO SICK READERS OF MARITIME FARMER

Famous Scientist Who Originated the Now Wonderful "Home Treatment" Offers $1.00 Package Free to Sick and Ailing.

In order that every reader of Maritime Farmer who may not have heard of this wonderful "Home Treatment" may have an opportunity to test this celebrated medicine, the now famous scientist, Dr. James W. Kidd, offers to give absolutely free a full size $1.00 package to five hundred readers of this paper, to prove the wonderful claims which have been made for it. In making this offer the scientist said: "I know that there are many people who have been suffering for years with some chronic disease and many of them have spent large sums of money seeking a cure. I know that these people hesitate about investing money in medicine because they have despaired of ever getting well. Thousands have told me that story and many thousands of the same people have told me afterwards that my treatment had cured them after doctors and everything else had failed. I want to prove to a limited number—no matter what the disease, no matter how long they may have suffered no matter how blue and discouraged—that my treatment really and actually does accomplish the wonderful results that have been reported."

People who suffer from Rheumatism, Kidney Trouble, Stomach Trouble, Liver or Bowel Disorders, Catarrh, Bronchitis, Asthma, Chronic Coughs, Weak Lungs, Lumbago, Piles, Urinary Disorders, Female Weaknesses of any kind, the weak, worn out, broken-down and despondent will be delighted at the effect of a few doses. This wonderful treatment creates a fine appetite and helps the digestive organs to carry on their functions as they should. It strengthens the kidneys, too, and drives rheumatism poisons from the blood as if by magic. That is why people who try it become so enthusiastic.

Any reader of Maritime Farmer who will try this extraordinary medicine that has created so much excitement by its cures can obtain absolutely free a full $1.00 treatment by simply filling in the coupon below or writing a letter describing their case in their own words, if they prefer, and mailing it today to James W. Kidd, Toronto, Canada. No money need be sent and no charge of any kind will be made.

As this offer is limited, you should write at once, in order to be sure to receive your free treatment.

Coupon CB-260 For Free Dollar Treatment

Dr. Jas. W. Kidd, Toronto, Canada.

Please send me a Full $1.00 Course of Treatment for my case **free and postage paid**, just as you promise.

New England Tomato Soup.

To one quart of canned tomatoes add one pint of hot water, one tablespoonful of sugar, one teaspoonful of salt, four cloves, saltspoonful of white pepper; bring to a boil; in the meantime put one tablespoonful of butter in a saucepan; when it melts put in one tablespoonful of spring onions, one tablespoonful of parsley; fry five minutes; add one tablespoonful of cornstarch dissolved in two tablespoonfuls of cold water; stir into hot tomato, strain and serve with boiled rice.

How to Preserve Health.

A health almanac containing information calculated to improve the health of Kansas people was issued by the state board of health. The first charge to the public is to "avoid patent medicines as you would a pestilence."

Here are a few epigrams about health contained in the book:

"An open window is better than an open grave."

"Warm rooms have killed more people than have ever frozen to death."

"A stiff drink makes the stomach warm, but the skin cold."

"A mustard bath for the feet will do far more to ward off pneumonia than a gallon jug."

"A dirty well is more dangerous than a dirty kitchen."

"It takes time to boil a baby's bottle, but it saves sorrow and sleepless nights."

"Flies in the kitchen may be almost as dangerous as rough on rats in the pantry."

"If your milkman brings you warm milk, make it hot for him."

We wish to call the attention of our readers to the advertisement of Guernsey and Jersey bulls for sale, offered by Glenview Farm, Walter McMonagle & Sons, Sussex, N. B. These animals are sired by Fairy's Nonpareil and Imported LaChasse Foxey, respectively. They are both a fine quality of large size, very suitable for an agricultural society, and will be sold at a reasonable price for immediate sale.

Last Call for the Winter Fair.

The Twelfth Annual Winter Fair will open at Amherst on Monday, Dec. 2nd.

By the time this copy reaches its readers the entries will be in.

It is necessary, however, that we should call attention to the fact, that this fair is entitled to the support of all in the Province interested in agricultural work.

While we have our respective provincial and county fairs each year, this is the only one of the kind where a great portion of the work is given to education. This year for the first time a milking machine will be operated by electricity. The usual arrangements have been made for transportation over all railway lines, and it is hoped that each and every person will make an effort to attend at least one day during the week.

Fall Spraying for Scale.

Before cold winter weather sets in there should be some spraying done wherever the San Jose scale is present. If present in such numbers as to cover or encrust parts of the tree their injurious work is generally manifested by some dead branches or the premature falling of the leaves.

It is not safe to wait till spring and think that no further damage will be suffered by the trees. While the scale does not propagate during cold weather, it continues to draw nourishment from the sap and when plentiful enough to cover the bark, the drain on the vitality of the tree is severe and it emerges in the spring much weaker than it was in the fall. In some cases it is weakened beyond recovery and dies.

This, then, is a good and sufficient reason why spraying should not be postponed till spring, but there are further reasons of weight. One of these is that the shell of the scale is softer in the fall, for it grows harder through the winter, and consequently is more susceptible to the action of the various sprays. Fall spraying is more thorough and effective than in the spring. A greater per cent of scale will be killed and the same work will have better results.

There are other reasons of lesser importance, such as the fact that the weather is more propitious in, say November, than in windy and changeable March. Freedom from high winds generally prevails in the fall. The ground is firmer and will permit the passage of wagon or sled. In the spring the soil is often wet and miry for weeks at a time.

Farmers and fruit growers are much more at leisure in the fall and the work of spraying is not so costly in the time it consumes. Time is precious in the spring, for many kinds of work call for our attention all at once and there is loss in delay. Sometimes spraying for the scale is prevented entirely by continued rains, for scale sprays must be applied before the buds open. In fall spraying there is a wide latitude, for it may begin as soon as the leaves fall and extend up to and through the winter whenever the temperature is above freezing.—L. R. Johnson in N. E. Homestead.

Fall Spraying is Desirable.

I would close up the year with a thorough spraying of everything, including not only the orchard trees, but the walls of the barns, stables and hen houses. I would not store my apples until the cellars had been thoroughly cleansed with bordeaux, and possibly kerosene emulsion. The germs of mildew and other forms of decay will not only start rot in the fruit, but will spoil the flavor. Nearly all apples which we find in the winter and spring markets have a moldy taste.

The trees have special need of bordeaux well sprayed into the cracks of the rough bark. Plum trees are well supplied with germs of black knot to be developed in midwinter. Look out for these.

In the barns and stables a good coating of whitewash should be added right after kerosene emulsion. Let the insects start out at the greatest disadvantage in the spring.

Then at it again before the foliage starts in April. The currant worm comes first, and it should be met with a thoroughly good dose of arsenate of lead and white hellbore. This spraying should not wait for the early foliage to be half eaten. It should come just as the buds are swelling, and then again as the blossoms are opening.

You will hardly get through with the currants and gooseberries before your plum problem is on hand. And here again the arsenate of lead will do a good job for you applied after the petals drop. And from this time on we have a steady fight through the year, but it will be very much lessened if the fall and winter spraying had not been neglected.

If anthracnose has ever showed itself in your vineyards, swab the vines with a solution of copperas before the buds break in the spring. Only a little later use bordeaux for the black rot. Occasionally the leaf folder turns up in vast numbers, and it will be desirable to keep ahead of it by a winter spraying of lead arsenate, followed by another in the spring.

form as you can get along without,

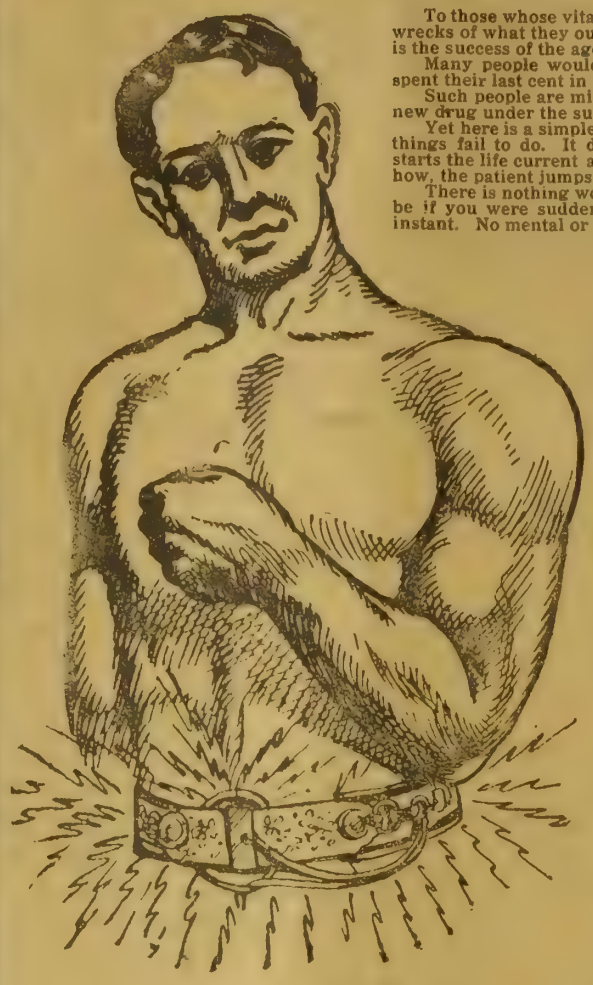
Use just as little kerosene in any applying it mainly to old trees and on the bark. All through the summer be ready for bordeaux mixture to spray your plum trees at the first sign of yellowing leaves, but you will have very little trouble from fungus if you have given these trees a thorough fall or winter treatment.

Spraying as a preventative is of vastly more importance than as a curative. It is for this reason that I would not let up when the summer fight is over, but would give the trees, even the largest trees a spraying of bordeaux after the orchard has been picked, sometime in November. This spray will get at a large amount of spores and germs that lie quiescent during the winter and are ready for business as soon as the buds begin to swell in the spring.

It must never be forgotten that fungus spores are not any more than held in abeyance by frost. The plum knot does its work in February and March and sometimes earlier. In other words this business of spraying depends for its success upon keeping ahead of our enemies.—E. P. Powell in N. E. Homestead.

DR. McLAUGHLIN'S ELECTRIC BELT

IS MADE FOR YOU



To those whose vitality is exhausted and who find themselves, young in years, broken down wrecks of what they ought to be, the Dr. McLaughlin Electric Belt is full of encouragement. It is the success of the age in elevating the condition of those suffering from a loss of vitality.

Many people would give all they possess to regain the health they have lost. Many have spent their last cent in its pursuit—and thrown their money away.

Such people are mislead by custom and the well-meant advice of friends. They take every new drug under the sun and find them useless.

Yet here is a simple, natural remedy, Dr. McLaughlin's Electric Belt, that does what other things fail to do. It does not poison the system nor depress the spirits. On the contrary, it starts the life current anew and produces health. It invigorates the mind. Without knowing how, the patient jumps from despondency to health and ambition.

There is nothing wonderful in this change. It is all so natural. Think what the effect would be if you were suddenly deprived of all the electricity in your body. You could not live an instant. No mental or physical life could exist without Electricity. Naturally, when the amount is below normal you are less vigorous, less ambitious.

Then is the time my Belt does great things for you. It recharges your nerves with life-giving current. Soon strength and vitality are restored. You feel the old stimulating glow of heath. You now have the right amount of Electricity and you feel "equal to anything."

What is my Belt? It is a body battery, made for the purpose of applying Electricity to the human system in the most scientific and effective way. It is made on an entirely-different plan from the worthless devices known by "Electric Belt" Its current is of guaranteed strength and constancy. It is provided with a regulator. This enables you to change the current to suit varying needs. You wear it at night. It's soothing currents send you to sleep. You wake up refreshed and invigorated. Before long you feel like a different person---and you are different. Your friends tell you so.

The benefits of my Belt are being daily demonstrated by thousands of patients, and it is heartily endorsed by those who have been cured.

If you are sick or weak, and your doctor isn't helping you much, you ought to try my Belt. It's a grand remedy. All such troubles as Indigestion, Constipation, Torpid Liver, Tired Feeling, Weak Kidneys, Rheumatism, Neuralgia, Lame Back; Lumbago, Sciatica, Sleeplessness, Nervousness and Headaches are cured completely with Electricity applied with my Belt; it overcomes all signs of weakness or breakdown in men and women. My Belt not only cures the sick, but gives the well a greater zest in life.

Dear Sir,---I have had your Belt in my home for some little time; my family have used it, also myself; and I find it a great cure. We could not do without it. Yours with much respect, MRS. R. E. McELROY, Arcola, Sask.

Dear Sir,---I beg to report that the Belt I received from you some time ago is doing good work, and wish to say that I am feeling better in every way. My stomach is very much better; also my nervousness is rapidly leaving. I can now sleep quite soundly and get up quite refreshed. Sincerely yours, C. E. SCANTEBURY, Supt. Ry. Mail Service, Calgary, Alta.

Dear Sir,—I have felt no pains in my back since I discontinued to wear your Belt some months since. I must say it was a marvel how quickly it effected cure on me and I shall have great pleasure in recommending your Belt to any one who suffers from a bad back. Thanking you, I beg to remain. WM. BUTTERS, Gull Lake, Sask.

Dear Sir,—I am glad to say that I am completely cured of my Rheumatism by the use of your Belt. I certainly felt the benefit of it and am glad to say that I am quite clear of Rheumatism and my Belt is worth more than what I paid for it. You can refer any sufferer to me who is in doubt. Wishing you every success, I remain, ED. JOHNSON, 109 Elmwood Ave. E., Winnipeg, Man.

FREE BOOK

If you cannot call and see me personally, you can write for my book. It will cost you nothing, and will tell you lots of things you ought to know. Send coupon for this beautifully illustrated 84-page Free Book to-day, "Electricity is Life." I know best how to apply the remedy, and thousands of men owe their health and happiness to-day —their success in life—to DR McLAUGHLIN'S ELECTRIC BELT.

HAD BOILS
ON FACE AND BODY
WAS TROUBLED FOR 8 YEARS.

Boils in themselves are not a dangerous trouble, but still, at the same time are very painful.

They are caused entirely by bad blood, and to get rid of them it is absolutely necessary to put the blood into good condition.

For this purpose there is nothing to equal that old and well known blood medicine, Burdock Blood Bitters.

Mrs. James Mageean, Floral, Sask., writes:—"I was troubled for eight years with boils on my face and body, and I tried everything I could think of. My neighbors told me to drink water off of sour corn meal, but I kept getting worse until one day a woman in town asked me why I didn't try Burdock Blood Bitters. My husband got me two bottles, and before one was gone my boils had all disappeared, and I feel like a different woman. I can't tell you how thankful I am for your medicine. I will recommend it to all suffering women."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

THE PLAYTIME WASHER

Means a saving of money to the farmer and his wife. The time and energy spent over the wash tub could be employed more profitably in some other way. It might mean more and better butter, poultry, fruit and eggs. The "Playtime" is adapted to either hand or power operation. In either case it eliminates the HARD work of washing and saves wear and tear on the clothes.

Ask your dealer to show you the "Playtime" or send to us for full information 109

Diseases in Autumn.

We enter on the autumn months with birds that are not as forward as last year, neither are they as physically sound taken generally. Every morning the fields are covered with heavy dew, and though the birds rise early and search far and wide for animal and insect life, they do so at very great risk of catching cold. This is one of the reasons why the months of September, October and November are so treacherous to the poultry keeper. Prevention at all times is better than cure, and with this in view the poultry keeper should make special efforts to provide good, roomy houses, properly lighted and ventilated, and with the flour very dry. Damp floors are responsible for more colds in fowls than anything else. If a good scratching shed is provided in addition to the house, and the floor is littered to a depth of eight inches with peat moss, and several inches more with straw, it will form an ideal scratching place during bad weather. It is the number of idle hours which fowls spend out in the open, and often with cold winds blowing, that result in so many different complaints arising. There are many kinds of colds, some of them are much like a severe cough in human beings. This can generally be cured with stiff doses of glycerine, while some people make a practice of placing roup powder in the food and drinking water two or three times weekly. The quickest way at all times, and the safest, is to isolate the birds immediately any sign of disease is present. Some kind of hospital should be made on every farm, but unless this is a warm building it will be of little use for bringing the patients round.

CANKER.

Diptheric roup, or canker, as it is frequently called, can generally be told by the offensive smell from the birds' throats. If a white cheesy matter is formed this has to be scraped off, and though the sore place may bleed profusely, it is a practice which has to be done day after day. With the growth removed the affected parts should be treated with weak carbolic acid. Only medicines of a very strong nature are effective. If a feather is dipped in the solution, this is one of the best ways of administering it.

SCALY LEG.

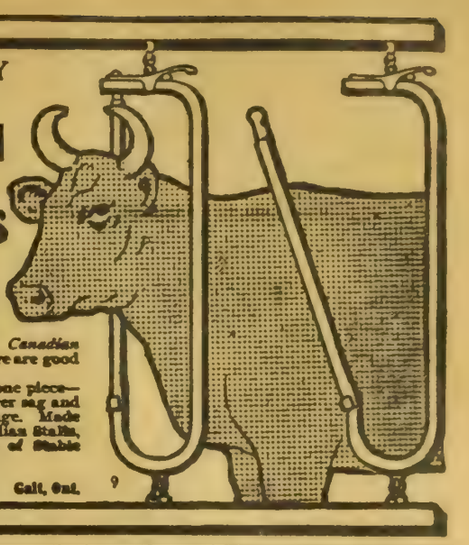
Fowls which are housed under proper conditions should not suffer from scaly leg, no matter how long they are kept, but when it is noticed (and it must not be forgotten that it can spread from one flock to another, just like other complaints), successful treatment can generally be carried out by wrapping the legs in cotton wool which has been immersed in paraffin. If this is done for three weeks, in nine cases out of ten a complete cure will be made. I have always noticed that scaly leg is most prevalent where no grass is on the ground and where cleanliness is not strictly carried out. All the houses should have powered lime thrown in weekly, while a few times yearly the interior should be treated with a good wood preservative. Even the perches must not be forgotten.

BOWEL TROUBLE.

It often happens that chickens with cold suffer from bowel trouble, the droppings are often of a liquid nature, also very yellow in colour and it is only with great difficulty that bowel trouble can be cured. Some people believe in giving boiled rice. This is certainly harmless, and has a tendency to do good, while a little charcoal may also be added with the soft food. Suitable diet will sometimes prove a very effective treatment.

FACTS—NOT THEORY —ABOUT

O.K. CANADIAN U-BAR STEEL STANCHIONS



When big stables like the Central Experimental Farm at Ottawa — the new barn at Silver Spring Dairy Farm, Ottawa—the Brindale Farm at Toronto — are equipped with *O.K. Canadian U-Bar* Patented Steel Stanchions—there are good reasons for it.

O.K. U-Bar Steel Stanchions are of one piece—have no rivets or joints—therefore never sag and stand up against the most severe usage. Made in 5 sizes. We also make O.K. Canadian Stalls, Water Basins and a complete line of Stable Equipment. Write for catalogue H

Canadian Potato Machinery Co., Limited, Galt, Ont.

EGG-BOUND PULLETS

These are more noticeable during autumn months than at any other time of the year. If the chickens have been allowed unlimited food, especially of a fattening nature, it often happens that when the time comes for the first egg to be laid they are not in that sound condition so essential for successful laying. The ovary is crowded with thick layers of fat, and the passage of the first egg is a process of considerable difficulty. Sometimes a good dose of castor oil will answer the purpose, while at other times the affected bird will have to hold over a steaming kettle, vent downwards, and assistance rendered in order to induce a free passage for the egg. Weak-legged cockerals and pullets, especially if they are four or five months old, are frequently noticed during the autumn months. It is generally a case on feeding on too forcing foods, or attempting to grow the birds too quickly, with the result that the body has grown so heavy and the legs so long they do not seem strong enough to support the full weight. A few doses of chemical food, with milk and bread to eat, will often prove a speedy cure, but I have seen several times when this trouble has continued for many weeks, and only persistent treatment has brought about any degree of success.—Poultrymen.

To Investigate Markets.

T. R. Arkell, formerly professor of animal husbandry at the New Hampshire State College, who was recently appointed by the Dominion Government to make a thorough investigation into the Canadian sheep industry, left for Great Britain last week to commence his work. His first duty will be to make a study of the market of the Old Country, their demands as to grade and quality, methods of marketing, and to gather any information that may be of value to Canadian sheep raisers.

To Get Good Cows, Raise Them.

The question is frequently asked, whether it is better to breed or to buy cows. This, of course, depends a great deal upon circumstances, but experience has taught that the most successful dairymen breed their own cows. As a rule, sellers do not part with their best cows, and consequently there are more culls on the market than high price animals. In buying one has much picking and choosing to do, and good milkers nearly always bring their full value. No keen business man would buy goods at a high price and sell them at a loss. Yet this is practically what many dairymen do. They purchase cows much above their value and it costs more to keep these cows than the amount received from their milk.

The best way to get good cows is the best sires and only the heifers of to breed them. Grade up by keeping the most profitable cows. In this way each generation will be better than the last. Selection and rejection have a great deal to do with success in breeding.

FREE-MAGNIFICENT PHONOGRAPH-FREE

Here is the most stupendous offer ever made by any reliable firm. We will give away, absolutely free of cost, 1,000 of these magnificent imported phonographs, complete with your choice of thousands of the newest and most popular records.

This is the Chance of a Lifetime. Grasp It Now.

This magnificent phonograph will talk, sing songs, play orchestra or band music, tell funny stories and in fact DO EVERYTHING YOU WOULD EXPECT OF A $50.00 MACHINE. You want a phonograph in your home, but don't throw away your money by paying $25.00 to $50.00 to get one, when you can get this magnificent instrument absolutely free for just a few minutes easy work.

Now all we ask you to do, is just send us your name and address to-day, and let us send you by return of mail, all charges paid, just 16 of our famous Gold Dollar Concentrated Flavoring Extracts to sell for us among your friends at only 25c. each. These wonder flavors are the greatest improvement on ordinary extracts ever achieved. Handsomely put up in collapsible tubes, all the best flavors—Vanilla, Lemon, Orange, Raspberry, Strawberry, Almond and 20 others. Four drops of Gold Dollar Flavors equals a teaspoonful of ordinary extracts. Every tube is guaranteed to equal five regular 25c. bottles of regular flavorings. Every housekeeper you show them to wants to buy three or four tubes of the different flavors we send, and every lady who buys a trial tube can receive free from us, a magnificent edition of a new cook book, worth 50c. You cannot fail to sell them all in a few minutes. Our agents sell thousands of tubes daily.

SEND NO MONEY. We trust you with the extracts until sold. As soon as our money (only $4.00) is returned to us, you will receive the magnificent phonograph, all complete with record absolutely free. IT'S A WONDERFUL MACHINE.

We are spending thousands of dollars to introduce these famous extracts into every household, and when we say we will give you this grand phonograph, we will do so. Address to-day

Factors in Tile Drainage.

When the farmer has the funds and can do a thorough job of drainage at once it is best to do it. No farm investment where drainage is needed will yield a better return or replace it in making possible the most profitable working of the land for the greatest number of crops. When it is not possible for want of funds to complete the work at once the most productive fields should be drained first, those most convenient for cultivation and the handling of the crops.

The wettest parts of the fields should be tiled first and where the tile has shown what influence it has on the land there will still be found drainable soil that has not before been thought too wet for best results from cultivation. Then the work can be continued until finished. With a sod covering the land, the work will be most pleasantly done. If the land is worked in rotated crops, then the drainage work will come in order, the winter or spring before the land is plowed for corn. When sod is broken each year on a part of the fields the work can go on each fall, winter and spring, coming in regularly each year as a part of the farm work.

A half century ago each farmer as a part of the winter's work cut the timber off some of his land, making it ready for cultivation; now that the timber is gone tile drainage on most farms can well take the place of the old time clearing. The work should be planned ahead. When the land cannot be worked because too wet is a good time for the owner to be looking over it and finding out where tile is most needed.

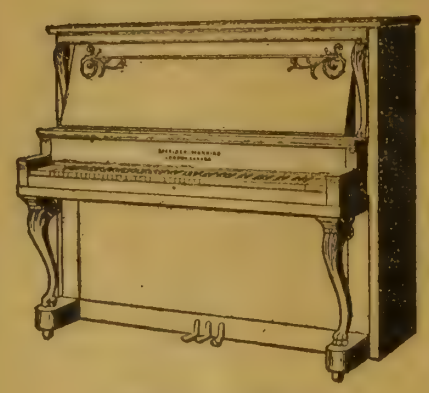
Years ago when rain was pouring down I commenced by putting on a raincoat and walking over the fields where prospective work was to be done at the earliest possible date, noting where the water stood the deepest on the surface and the location of the riffles where the water ran away. Sometimes I drove stakes to locate these places for future reference, as they marked the course of the water, the lowest points and the future location of the drains. Oftentimes the distances were stepped, carried in mind or made note of to help sum up the amount and sizes of tile needed. These things can be more correctly done when the rain is falling on the land than when it is cracked open from drouth. The abundance of water tells the need of the land for tile, the cracks in the soil the need of moisture as well as of tile. Oftentimes this study of the contour of the land will save the employment of an engineer. But there are times that to do the best work it is absolutely necessary to employ an engineer. Using the water-flow and the engineer's skill together is best. Unless the grade is quite steep the engineer's work, barring mistakes, is the safest and the condition of the soil often makes it necessary.

To make sure that the contemplated ditching will be done on time the tile should be purchased and hauled when the roads are solid and the tile can be had. After harvest tile are in abundance and the roads mostly good. At the finishing of the work in the spring the factory yards are empty and the roads in the worst condition for this work. When the work of an engineer is necessary it should not be considered finished until the farmer has a carefully prepared plat, and unless the workmen are entirely reliable and of much experience the engineer should not be dismissed until he knows the work is correctly done.

One of the most serious matters connected with farm drainage is the ignorance of the owner regarding the work and requirements to make the work perfect. On the part of the workman it requires more than skill in handling the tools to make the finish practical. Judgment and honor are most necessary factors. Some men by experience become very skillful in cutting and finishing a ditch for tile, yet there seems in most to be a lack of study and planning to save labor in handling the soil. The drains are too often cut too wide from top to bottom, the work being done with spades that have the blades too wide. Often to grade the bottom such scoops are used as are found on the market, never thinking that a good blacksmith can take the blade of an old shovel and make a scoop much more convenient and better in every way for this last and most important part of the work. The ditcher that profits by experience will soon learn that the work should be finished as it goes, leaving no ditch open for the tile over night. Two or three times I have found to my sorrow in the morning that both sides of the ditch had slipped into the drain. While the reasons for leaving the drains unfinished seemed reasonable and sound, the work of throwing out this caved-in soil was a convincing argument against the practice.

One should never expect entire success with a drain when the outlet is in any way obstructed, Always plan the system for as few outlets as possible. It is a prosperous sign to see tile at certain seasons piled about on the farm, to be used when the land is too wet to cultivate. But it shows that a farmer is not alive to his opportunities when tile remain in piles until they have a tumbled-down appearance and are overgrown with weeds and bushes.—John M. Jamison in Breeders' Gazette.

The Sherlock-Manning 20th Century Piano
"Canada's Biggest Piano Value"



Louis XV.—Style 80.

THE final consideration of all careful piano-buyers is summed up in the words: **will it endure?** When you buy a piano make sure of the **inside** features—**features that assure** not only **lasting tonal qualities** but also **the lasting life** of the instrument itself.

A piano, to be a permanent investment, **should** have the famous **Otto Higel Double Repeating Action--Poehlmann Wire**--the best imported--**Weickert Felt Hammers, none** better—**Billings Brass Action Flange,** the latest innovation. The

Sherlock-Manning possesses all these and every feature that makes for piano perfection.

See the Sherlock-Manning and judge for yourself. Or write **direct** to us and we'll forward you **inside facts** and **information,** telling you exactly how you can **save considerable money,** and yet **own** one of the world's **best** pianos by buying a **Sherlock-Manning 20th Century Piano.** Visit our factory, if possible. Write anyhow. 23

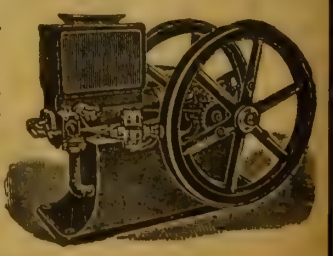
Home Tanning of Leather.

The method of tanning here described is the easiest and at the same time the cheapest and most simple. The only tools needed are a drawing knife and a butcher's knife. An ordinary tub answers the purpose of a vat. The first step taken in preparing a hide or skin for tanning is removing the hair. To do this place the hide in enough strong lime water to cover it, using a peck of lime to four gallons of water. Let the hide remain in this solution until the hair slips easily, airing the hide for five minutes every three hours during this process. Place the hide on a beam and remove the hair with the back of a drawing knife. Wash the hide thoroughly and soak for about 10 hours in clear water. The hide is then ready for the coloring compound. For this use two pounds gum camboge,one-fourth ounce extract soda

Monarchs---The Cure For Farm Drudgery



A post card starts you on the road to get a perfect farm engine—best made, best designed, best handled. Why drudge at chores like pumping, sawing, pulping, grinding chop, etc., when a "Monarch" makes this hard work easy? Sizes from 1 1-2 to 35 horse power. Fuel cost 10c a day or less.

Get our two-color folder and special easy-buying terms right now. A post card will get it.

CANADIAN ENGINES Limited, DUNNVILLE, Ont.

and one-fourth ounce ammonia to four gallons of water. Boil until the ingredients are thoroughly dissolved and when cool soak the hide in this solution for 24 hours.

Boil in a small quantity of water one ounce of hops, one-fourth ounce of wild cherry. Pour this into the coloring solution, place the hide in the mixture and let it remain for from three to 15 days according to the thickness of the hide. When the hide is taken from this solution, wring it as dry as possible and hang it in a cool, dry place. When nearly dry begin working and stretching it. This is done to remove the glue and to make the leather soft and pliant. If any hard places remain when the hide is dry, wet them with a little of the solution from which it was last taken and rub in until dry. The main thing in hand tanning is to work the leather thoroughly while the hide is drying. This makes the leather more serviceable where a soft leather is desired.

Another method of tanning is to place the skin in wet ashes and let it remain for about 24 hours. Air the skin two or three times while in the ashes. This will take the hair off and leave the skin a bluish color. If the skin is rubbed between the hands while drying it will turn a cream color and remain soft indefinitely. When using this method of tanning the most important part is the rubbing, as this takes out the greenness and makes what is called dressed skins. No chemicals are used and for this reason dressed skins are much stronger and more pliant than tanned leather.

This process of dressing skins is better than any other as there is practically no expense and the time required is much shorter than tanning with chemicals or with the old bark tanning process. Of course, for tanning heavy hides such as horse and cow hides the method given in the first part of this article is best as the tanning solution draws out most of the glue and makes less work in finishing the leather The formula for making this leather can be filled at the drug store. It costs about 75 cents to tan a 50-pound cowhide, including the cost of lime used in removing the hair.

Destroying Stumps With Acids.

The Agricultural Gazette of New South Wales, issued under the direction of the minister of agriculture of that country, says a farmer there has discovered that a mixture of equal parts of sulphuric and nitric acid will destroy a stump of the hardest wood in a few weeks.

The stump of a mahogany tree three feet six inches in diameter was destroyed so completely in five weeks by the use of 12 cents' worth of acid, that it could be knocked to pieces with a garden hoe. On the subject of applying the acid, the Gazette says: "The acids are used in equal parts and nothing is added to them. A hole is bored in the stump with a two-inch augur, deep enough to hold the quantity of acid to be used, and then one acid is poured in and the other added. The hole is then plugged air tight with a wooden plug."

A stump three feet in diameter should be treated with about one-half pint of each acid. The nitric acid is poured into the stump first, and the sulphuric acid is added in all cases, and not the reverse. In mixing these acids much heat is generated and care must be taken not over a half pint of each to be mixed at one time, whichmust be allowed to cool before any more is added. Both of these acids are extremely corrosive and should not be allowed to come in contact with the person or their clothing.

This Stylish Ulster

Best English Tweeds $8.75
Lined with Fleece or Italian Linings

Here's a remarkable overcoat at a remarkable price. The price is English—all clothing is cheaper in the "old country" than here—and you get the benefit of our colossal output.

England is the home of "Tweeds"—and is, too, the home of good tailoring, both in style and workmanship.

This winter overcoat will excite the envy of your friends who have paid three times as much.

The fleece lining is a new feature—will keep you warm in the coldest weather. The coat is double-breasted style, with belt behind. In fact, this garment is a chance to Canadians to get a coat to their own requirements at the English price, from a leading London firm of tailors—and London style leads the world.

(Cut in either American or English styles.)

Also an English "Fall" Raincoat
The "REGOETTE" $8.75

Made to Your Measure. Two Styles.

The "Regoette" Raincoat is right up to date in cut, style and finish. Light in weight, it may be carried over the arm without inconvenience, whilst as a walking coat in cool weather it is just right. Easy fitting and good looking. The excellence of both material and tailoring is apparent at once to discriminating men. It carries an absolute guarantee to keep out the water or money refunded.

This is a smart, dressy raincoat, of which thousands are being worn by well-dressed men in England—men who are notoriously hard to please in the matter of clothes.

(American or English cut.)

Get the Two Coats for $16.25
Carriage and Duty Paid.

Such a price is only possible by reason of our huge business—one of the largest in London—enabling us to purchase largely, and therefore cheaply.

Have your garments made to your measure. Maintain individuality in your dress.

$8.75
Carriage and Duty Paid

Milking Cows Before Calving.

The writer is inspector of live stock breeding for the agricultural department of the grand duchy af Baden, Germany. He says:

In the literature and in public addresses it is recommended to milk, and even to milk dry, animals whose udders are greatly swollen before calving. Experience has, however, shown that this unnaturally early milking may, for one thing, postpone the birth for a considerable time. Furthermore, it exercises other far reaching influences on the act of parturition. The birth pains are greatly diminished. The physical stimulus which is designed to be exerted by the congestion of blood to the entire hind parts of the animal is broken by the emptying of the udder, the stimulus on tne entire sex apparatus is reduced, the birth pains are delayed and finally are much less violent. Whoever has repeatedly observed the effects of such premature milking before calving will understand that the postponing and diminishing of the birth pains exercises an unfavorable influence on the whole act of parturition and may result in miscarriage. For these reasons, milking before calving should be avoided with extremely rare exceptions.

If there should be a case where the swelling of the udder of the cow becomes so colossal that not only the udder and the teats are stretched tight, but unusual swellings also appear in front and behind the bag, and the animal when standing still suffers serious pain without being touched, and perhaps the milk drips out—this is an exceptional case where some milking may be justified before calving. But it should be done only enough to relieve the extraordinary tension, but the cow should never be milked dry, as is often done. Besides the difficulty of dropping, the calf would lose the colostral milk which is so important for the cleansing of the intestinal tract and the prompt growth of the young animal.

What is Casein?

Prof. H. H. Dean, in answer to the question, "What is casein," says in the Farm and Dairy:

It is the chief nitrogenous compound found in milk and consists chemically of the elements carbon, hydrogen, oxygen and nitrogen. It is distinguished from milk fat, in that it contains the element nitrogen, the most valuable of all elements for plant, animal or human food. It is the most expensive fertilizer which the farmer needs to purchase. It is the most expensive ingredient which the housekeeper buys in food. The white of an egg, the lean portion of meat, the curd of cheese, are common examples of foods containing the element nitrogen. It alone builds muscle in the animal or human body. Plants deprived of nitrogen wither and die.

Casein is secreted in milk by the cow, by means of special cell activity. Its primary source is the nitrogenous material in the foods fed to a cow, which is transformed into blood, and from the blood it passes into the milk through the action of cells. The foods fed to a cow containing nitrogen are the most expensive to purchase, such as clover hay, peas and gluten meal, bran, oil cake and cotton seed meal. Without a fair proportion of foods fairly rich in nitrogenous matter, it is impossible for the cow to produce milk economically. And yet in testing milk at cheese factories some would utterly neglect this important ingredient of milk and cheese.

Turnips for Milch Cows.

Some dairymen avoid feeding turnips to dairy cows although they are among the best milk-producing feeds. The principal objections are that they require so much time and lgbor to cut and that they taint the cow's milk rendering it unfit for cheese or butter making.

During the past season I have fed turnips to dairy cows with very satisfactory results. I give a liberal feed of turnips when the cows enter the barn to be milked. The turnips are not cut, but the cows are allowed to eat all they can manage whole. What they leave in the manger are cut to proper size before the next feeding. The cows soon learn to eat turnips of almost any size. I was cautioned that they would bruise their gums and make their mouths sore, but as yet have observed no such results.

To prevent taint of milk from feeding turnips, I exercise the following precautions: The stables are kept clean, for I have observed that manure has a much more offensive odor when turnips are fed than in ordinary feeding. The cows are salted liberally to facilitate disposal of intestinal products, and the stable is kept well ventilated, especially at milking time This last precaution reduces the odor. The cheese maker at the factory has told me frequently that he has been unable to detect the slightest taint in the milk.—Monroe Conklin, Sr., Allegany Co, N. Y.

Profitable Longevity of Dairy Cows.

Prof. C. H. Eckles of the Missouri Experiment Station sums up their investigations along the line of the profitable longevity of the dairy cow in part as follows:

"Probably the majority of dairy cattle are rejected from the herd on account of failure to breed, or from udder trouble before the effect of advancing years can be observed to any marked event. It is a fact often observed that a cow may make her best record when 10 or 11 years old, although as a rule she does her best rather earlier. If a dairy cow continues to breed, she usually shows no marked decline until at least 12 years old. Occasionally a cow continues to breed until she is 16 or 18 years old.

"While it is not entirely safe to judge the future milk production of a cow from her 2-year-old record, it is reasonably safe to judge the richness of her milk.

"A dairy cow on the average as a two-year-old may be expected to produce about 70 per cent; as a 3-year-old, around 80 per cent; as a 4-year-old, about 90 per cent of the milk and butterfat she will produce under the same treatment when mature.

"The richness of the milk remains practically constant from year to year, except that after the third milking period there is a slow gradual decline with advancing years."

FREE This 150 PIECE Complete Scholar's Outfit FREE

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water color paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit containing type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 complete dater good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it this scholar's complete outfit is FREE. We are determined to sell a million packages of Marvel Bluing this year and are sparing no expense to reach this mark.

Marvel Bluing is a great improvement on the old style of bluing and goes twice as far. Everybody buys it because it is so good and a present is given away with every package.

We will give you one of these grand scholar's outfits IF YOU WILL AGREE TO SELL ONLY 25 PACKAGES OF MARVEL BLUING AT ONLY 10c. PER PACKAGE. Any boy or girl can sell 25 packages easy. No trouble at all.

We send you the Marvel Bluing free and trust you with it until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits.

Try. If you can't sell the Marvel Bluing send it back to us.

Address to-day THE MARVEL BLUING CO., Dept. S. 101 Toronto, Ont.

To Prevent Sunscald.

Sun scald has done great damage in our orchards. It will continue to do damage, until we apply ourselves energetically to its eradication. The following letter recently written by I. F. Metcalf, B. S. A., District Representative of the Ontario Department of Agriculture, to the fruit growers of Manitoulin Island, will be of interest to fruit growers everywhere whose trees suffer from sun-scald:

"You may have had trouble with some of your younger trees dying this season and did not know what was the matter with them. Perhaps you thought it was blight, when it was something else. If you find at the crotches of the limbs—and in some cases along the limbs—spots where the bark is dead and shrunken, it is probably sunscald that did the damage. In many cases you will find the limbs almost girdled from the effects of the sunscald.

"Sunscald is caused by getting a few very warm days early in the spring, such as you did last March. The sap is started by the heat of the sun, then cold weather sets in, and the sap freezes. Most of your trees will stand lots of cold, but will not stand the combination of heat and cold.

CUL OUT AFFECTED PARTS.

"The injury usually happens on the south or south-western side of the tree. The only remedy is to cut out all dead bark and put on a poultice. In many cases the injury is so bad that the only remedy is to cut off the wholetop of the tree. This will force new shoots to grow out along the sides of the old trunk and in a very short time you should have a new top on the tree since all the energy of the old trunk and roots will be devoted to produce this new growth.

"Prevention is much better than cure. Prevention consists in protecting the tender wood from the rays of the sun. This may be done by enclosing the trunk and crotches with corn stalks, building paper or shading by nailing two boards together in a V-shape and placing upright on the south side of each tree.

SIMPLEST METHOD OF ALL.

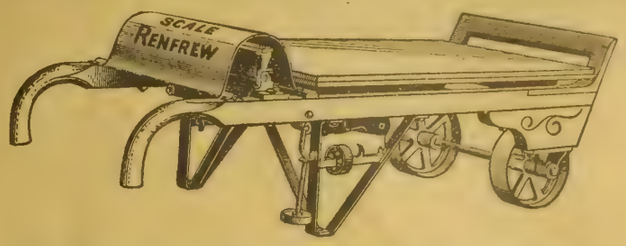
"By far the easiest and simplest method is to give the trees a coating of whitewash the last thing in the fall, so that rain will not wash it off. This white color will throw off the sun's rays instead of absorbing them, and thus act as a protection. It will also protect the buds starting too soon in the spring. Every person having an orchard of young or tender trees in this northern district would do well to make a practice of applying whitewash to his trees the last thing every fall.

"Of course there is only one way of applying the whitewash satisfactorily, and that is by means of a spray pump. This does not need to be a large outfit but should have plenty of power (or pressure as it is called) for its size. Such an outfit as I have been using this past season (Spramotor No. 0) should be a very satisfactory outfit. If you have not purchased a spray outfit yet, I would advise you to go in with one or more ofyour neighbors and buy one of those pumps. It will be of use to you in spraying lime and sulphur in the spring for the oystershell bark louse, and in spraying lime and sulphur and arsenate of lead at the time the blossoms fall to prevent codling moth (the worm in the apple) and scab. It would also come in handy for you to whitewash your sheds, stables, etc., and in many cases in using mineral paints."

SAVING THE FARMER'S PROFIT

THE MISSION OF

THE RENFREW HANDY
TWO WHEEL TRUCK SCALE



Daily loss,—that's what inaccurate scales mean to the farmer. Loss on everything he sells by weight.

Stop it NOW. Let the Renfrew do your weighing, and get every cent of profit on your prouuce, that you should get.

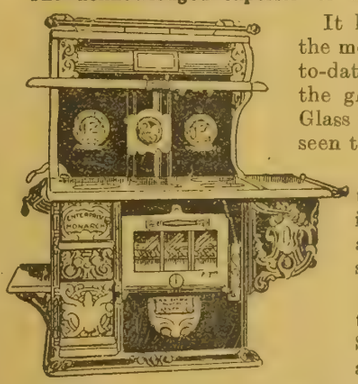
CANADA'S FINEST STEEL RANGE
"THE ENTERPRISE MONARCH"--For Wood or Coal

The acknowledged superior of anything yet made in this line



It has an established reputation as the most thoroughly constructed and up-to-date steel range on the market, with the greatest of all improvements—the Glass Oven Door, through which can be seen the contents of the oven.

We experimented with this feature for a long time and now have it right. No more waste of time and heat—the "Daylight Oven" solves the problem.

Note also the striking design of the Monarch, its convenient End Shelves, Full Length Towel Rod and other unique features.

As to its good baking qualities, ease of operation and economy in fuel, consult the neighbor who has one, or write direct for list of references and particulars.

The ENTERPRISE FOUNDRY CO., Sackville, N. B.

Box Measures.

The figures given below refer to inside measurements'—

A box 17.329 (approximately 17 1-3) inches long, 17 inches wide and 8 inches deep will contain a bushel, or 2, 218.192 cubic inches, each inch in depth holding one gallon.

A box 24 inches long, 11.553 (approximately 11½ inches) inches wide and 8 inches deep will also contain a bushel, each inch in depth holding one gallon.

A box 12 inches long with the width and depth given in the last foregoing paragraph will hold half a bushel, each inch in depth holding half a gallon.

A box 6 inches long by 5.776 (approximately 5¾ inches) inches wide, and 8 inches deep will contain a gallon, or 277.274 cubic inches.

A box 4x4 inches square and 4.332 (approximately 4 1-3) inches deep will contain one quart.

Feed Stock Intelligently This Winter.

Careful feeding is an art which every stock farmer should try to master. General principles remain the same, but changing conditions and varying prices of feeds make it necessary that the feeder exercise both brain and lead pencil. Talk of balanced rations, protein, carbohydrates, fat, concentrates, etc, needlessly frightens some farmers. Articles have appeared from time to time in these columns carefully explaining fundamental principles of feeding.

General principles were laid down which enabled the feeder to calculate any combination for any condition that might arise. It was explained that a maintenance ration is that which keeps the animal alive and does not allow for production, as, for instance, 15 quarts milk daily from the dairy cow. Protein is the most expensive compound that farmers buy, and it is the only one which contains nitrogen. Hence, a ration carrying a large amount of protein is called a nitrogenous feed. There are no other compounds that will take its place. Protein, may, when fed in excess, do the work of carbohydrates and fats, but at a greater cost. Growing animals and animals giving milk need extra protein. On the contrary, if an oversupply of protein is given, it becomes a waste product, hence the importance of the feeder knowing when he reaches the profitable point. Grains like cottonseed and gluten are exceedingly rich in protein.

PROTEIN ALONE NOT SUFFICIENT.

Essential as is protein, carbohydrates and fat must be available. The former is usually produced in large quantities on the farm, and constitutes the crude fibre or coarse material found in hay, cornstalks, etc. A feed that has a large amount of carbohydrates in comparison to protein is called a carbonaceous feed. Corn is typical of such a feed stuff. This coarse fiber is used by the animal body to supply heat or energy, and for the building up of the body fat. This explains why corn meal is the first feed usually thought of if an animal is to be fattened.

The fat in feed serves the same general purpose, supplying where the carbohydrates fail. Fat also has a soothing effect on the digestive tract, and helps to keep the animal in good condition. Animals require a certain amount of fiber or roughage. Balancing these different elements of protein, carbohydrates and fat for the most economical results is what is meant when one speaks of a balanced ration.

Now that the winter season is here, it behooves every farmer to take an interest in what he is feeding his animals. He must first do his duty before he can call any animal a robber. Poor feeding is more the result of indifference than complex problems. Any average man can feed intelligently if he will only apply his natural ability and take a few minutes to think straight and observe accurately.

FEEDING CATTLE TO ADVANTAGE

The feeding of beef cattle does not cut much figure in the East. Eastern farmers appear content to let other sections of the country and the beef trust monopolize that branch of stock husbandry. However, feeding dairy cows, horses, hogs and sheep is fully as important, and there are few farmers it does not interest.

Milk producers of experience know that best results cannot be obtained from cows without grain, even when in good pasture. Grain will increase the milk yield. Stimulate the cows to give the best possible flow during the early stages of lactation, then maintain this flow by judicious feeding. If a cow drops off three or four quarts in production through decreased feed, it will take much extra feeding to bring her back to normal.

Despite the fact that nitrogenous grains, like gluten and cottonseed meal are more effective in milk production than corn, hundreds of farmers will group their grain ration about corn meal. Fortunately, the introduction of special feeds, already balanced, is over-coming this tendency. When a grain ration may vary from two to 12 pounds per day per animal, it shows the wide latitude for judgment on the part of the feeder. Only good cows are liable to utilize 10 to 12 pounds grain daily. Only the feeder who has the animal under daily supervision can tell the most economical quantity. Where grain prices have been the past six months, cottonseed meal has been the most economical source of protein. Farmers are fast learning the value of this feed. It should never be fed alone, being very concentrated and not palatable to the animals. The Mississippi experiment station found a pound of cottonseed meal equal to three pounds corn and cob meal for milk production. Gluten is much more palatable, but carries less protein, and prices of the feed largely determine which is to be used, or what combination of them.

WHAT TO FEED THE PIGS

When it comes to feeding hogs, general principles do not vary. However, remember the hog's stomach is much smaller than that of a cow, and where the latter will do well on two feeds daily, the hogs should have at least three, four is better. They will generally consume less food and make better use of it if the rations are varied. An elaborate experiment with 500 animals showed that a mixed grain ration of 432 pounds produced 100 pounds pork, whereas it took 485 pounds corn to give the same grain, and 472 pounds oats and 452 pounds wheat.

The Maine experiment station finds that the addition of pea meal or gluten meal to corn meal adds to its efficiency, this both during the growing and the fattening periods. Provide the pigs with plenty of nitrogenous foods, especially when animals are young and growing. Carbonaceous foods, like corn, but this does not mean that milk, barley, ground peas, etc., should be ignored.

Tests at different experiment stations and the experience of farmers indicate several general conclusions: That growing pigs require nitrogenous feeds, like milk, shorts, ground peas, oats or barley. Ashes fed regularly to hogs increase the strength of the bones by 50 per cent. Cooking feeds for pigs is unnecessary, with the exception of fruit crops. The increased grains made on ground grains are seldom sufficient to pay for the extra cost of grinding. Boaked grains can be more economically fed than dry grains, this usually being equivalent to grinding.

Hogs gain more rapidly and can be fattened more economically before they have reached maturity. Corn and its by-products are the most effective grains for finishing off hogs. Shorts and buckwheat tend to produce a soft meat. Exclusive corn rations in the early stages of growth reduce the size of the muscles and kidneys, diminish the strength of the bones and reduce the quantity of blood. A mixture of charcoal or ashes, with salt and possibly a pinch of sulphur, should be kept where hogs may help themselves from time to time.

CLOVER EXCELLENT FOR SHEEP

The farmer who has plenty of good clover hay isn't much troubled with a satisfactory feed for sheep. The Wisconsin station reports that corn fodder fed with oats and bran gave better results than when these feeds were combined with oats straw or hay. Breeding ewes receive one-fourth to one-half pound grain daily when the roughage is clover. More will be required if straw or fodder is used. The grain ration may be whole oats, peas or bran, or a mixture of these. Feed corn sparingly to breeding ewes; two or three tablespoons of oil meal may be fed profitably, and as every farmer knows, silage or roots will provide the highly desirable succulence. The Wisconsin station reports that the best and heaviest lambs were produced when lambs were fed one-half pound grain per head daily, with 2½ pounds corn silage and two pounds mixed hay. It is not economical to withhold the grain from breeding ewes, as lambs are more likely to be weaklings and lack thrift.

It is pretty well settled that lambs may economically be given grain before and after weaning. The Wisconsin tried corn, whole oats, bran, cracked peas, corn and oats, and corn and peas. The estimated value was very low, corn being 30 cents a bushel, oats 20 cents, peas 45 cents and bran only $13 a ton. They concluded that the cheapest grains were made both before and after weaning with ground corn. Bran gave good results, but was rather bulky for young animals, and not easily digested. It developed that where ground corn was used, and lambs were apt to be sick than where mixed rations were provided.

The winter fattening of lambs born the preceding spring, as well as for old sheep, means more liberal grain feeding. Start them out with a very small portion, and increase gradually until they are receiving one pound when four weeks along, and two pounds when eight weeks. The

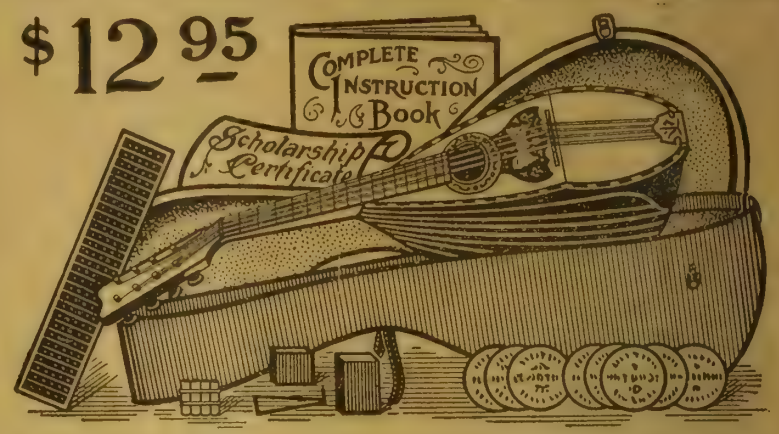
Parsons' Pills Help The Liver

$12.95



A Magnificent Mandolin Outfit $12.95

This is a superb instrument, and never before has a Mandolin of this description been offered at anything like so low a price.

An instrument of similar excellence is regularly sold by Music Dealers at double the price we are asking for complete Mandolin Outfit.

Look at the Completeness of this Outfit.

One special Mandolin—as described.
One leather bound Canvas Case, durably constructed and flannel lined.
One set of Tuning Pipes.
One lettered Fingerboard Chart.
One complete Instruction Book.
One extra set of good strings.
One Pick.
One Complete Scholarship Certificate in the United States School of Music—one of the best institutions of its kind in North America. Such a course of expert tuition is itself worth more than we are asking for the whole Outfit.

Mandolin Outfit Complete $12.95.

This special Mandolin is of American Manufacture. It has twenty-one ribs with white wood strips between; a rosewood veneered head; beautiful fingerboard of solid pearl inlaid with pearls of contrasting colors; and round the edge a splendid binding of alternate inlays of ebony and pearl. The sound-hole is bordered with a beautiful inlay of pearls of contrasting colors in fancy designs, and the celluloid guard plate is inlaid with a butterfly in varicolored pearl.

Truly an extraordinary instrument, and one that will command the admiration of all, both for beauty of design and richness of tone.

Players and learners alike, should take this opportunity of getting a splendid instrument at a very low price.

We sell musical instruments of every kind and up to the highest prices. Violins up to $500.00 each.

A Range should be a permanent investment and guaranteed as such. The "Pandora" is fearlessly guaranteed by dealers as well as by the makers, simply because they know that it will give utter satisfaction. Can you wonder that so many people buy 112

McClary's Pandora Range

general rule is to feed all they will eat and still maintain a good appetite. If lambs get off feed, it may take a month or more to get them back. Palatability is another important thing in feeding lambs.

PICKING A RATION FOR THE HORSE

"Feed the horses all the hay they will clean up, and a bucket of oats, is the general advice, this with little reference to what the hay is, and the size of the bucket. Timothy hay is the standard for roughage. Clover hay is more nutritious, but is feared more or less by horsemen on account of its tendency to produce heaves. This is a needless fear if it is not fed when in a dusty and unclean condition. Corn silage has been fed horses with good results, but they must be broken in so gradually that it is doubtful if the average farmer should attempt to keep his horse from the silo instead of the haymow. Straw is frequently resorted to, and is really equal to some grades of hay. Oats straw is a satisfactory feed, but more grain must be provided than when hay is used. Many farmers like to feed carrots, since horses like them so well. However, these are very laxative, and stimulate the stomach and kidneys. They are recommended in colds and stomach disturbances. Feed them to the work horses sparingly.

The best grain ration will depend largely upon prevailing market prices. Oats are used extensively. Corn and bran mixed are relished by norses and provide grain at a moderate cost. One extensive foreign experiment reports that horses did best on a ration containing chopped hay mixed with ground grain.—N. E. Homestead.

Construction of Small Concrete Ice-Houses.

During the sweltering heat of summer many a country family longs for the comforts afforded by a home supply of ice. Too often summer passes without any preparation having been made for harvesting the winter ice crop. Now is the time to get ready for next summer by building an ice-house. For a private supply, many persons are using concrete ice-houses, since concrete is heat-resisting, is not rotted by the continual dampness from the ice and is ready every winter without repairs. Likewise a concrete building is fireproof, a quality especially valuable in the country.

With a concrete house, successful storage of ice depends only upon careful packing, air-trapped drainage at the floor line, and well regulated ventilation beneath the roof. Therefore the ice-house must be located on a well drained site and, if possible, in the shade of other buildings or trees. It should be turned end to the south.

The size of the building is dependent on the needs of the family. Nearly any household will consume one hundred pounds every day, or ten tons for the season. One cubic foot of ice weighs 57 pounds and a ton in the ice-house occupies about 40 cubic feet. If the ice is of a poor quality, meltage frequently amounts to one-third the quantity harvested; therefore it is wise to build a house of a capacity twice the calculated needs. For a farm with a small dairy, a sufficient supply can be stored in a building 10 by 14 feet (inside measurements) by 9 feet to the eaves and 13 feet to the comb of the roof. With an allowance of 1 foot on all sides of the ice for a packing of sawdust, the capacity of the structure is 20 tons.

Either concrete blocks or solid concrete may be used for the walls. Dig the foundation trenches 10 inches wide and 2½ feet deep. To remave water from the melting ice, lay a string of 4-inch drain tile from a point outside the building and ending at the service door, so that the top of the last pipe, a sewer "goose neck," will be at floor line 4 inches above natural ground level. Fill the foundation trenches with concrete proportioned to 1 to 2½ to 5. Above ground level the walls may be made of blocks (laid in a 1 to 2 cement sand mortar) or of solid concrete. For the solid wall mix the concrete 1 bag of Portland cement to 2 cubic feet of sand to 4 cubic feet of crushed rock, or 1 part cement to four parts bank-run gravel. Use movable forms, 3 feet high and extending around the entire building, to hold the mushy wet concrete until it sets. The day after they are filled, the forms may be loosened, moved up and filled again. During the placing of the concrete, reinforce the walls, 3 inches from the outside, with woven wire lencing or with ⅜-inch rods spaced 18 inches apart and running in both directions. Stagger the rods by placing half of them 3 inches from the inside surface of the walls. Imbed two rods or an old wagon tire in the concrete two inches above all door openings. During the construction set a service door frame (2½ by 6½ feet) between the forms at one end of the building. Likewise, while pouring the concrete for the gable ends, make provision for small ventilation doors 2½ feet square.

A wooden roof, while not durable like one of concrete, is more easily built. To hold the plates on the top of the side and gable walks, sink ½ inch bolts 8 inches long, heads down 6 inches into the concrete. Use 8-foot rafters and cover the building with a watertight roofing material.

Lay a 4-inch concrete floor upon the natural ground and give it a slope of ¼ inch to the foot in the direction of the drain at the service door. Place a trash strainer in the drain opening. The water in the "goose neck" sewer pipe will act as a seal and keep out the warm air of the drain.

Hinge the small doors in the gables to outside and top of the frames, so that they can remain slightly open at the bottom yet shut out rain. The service door also swings outward. The frame is fitted with short removable sections of boards set in slots or grooves so as to hold the packing in place.

In storing ice use a thickness of 12 inches of sawdust or 18 inches of marsh hay or straw over the floor and around the sides of the house. Set the ice on edge and pack it tightly together without any filler between the cakes. To prevent blocks from slipping, lay them in courses lengthwise in opposite directions in what masons call "headers and stretchers". When the house is full, cover the ice-pack with sawdust or hay weighted down. Keep the service door closed while removing ice and take care that the pack is again well covered. See that the drain works properly and prevents water from standing on the floor.

For building this solid wall concrete ice-house, there will be required 27 barrels of cement, 8½ cubic yards of sand, 17 cubic yards of crushed rock and 74 pieces (250 pounds) of ⅜-inch rods 9 feet long. If good pit gravel is at hand, haul 18 cubic yards: no sand will be required other than that in the gravel. The approximate total cost of these materials is $75.00. Such a structure will not rot out and will keep the ice with minimum shrinkage. And by means of ice, not only can more comfort be secured in hot weather, but also fruit, poultry and dairy products can be marketed at a greater profit.

MAIL ORDER DEPARTMENT

W. H. Scroggie Limited

MONTREAL, QUE.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Sgd. J. D. IRVING,
Buctouche, N. B.

Variation of Cows Milk.

The Irish Homestead publishes the following: Some carefully conducted expetiments in connection with the variation of the composition of cow's milk with the advance of lactation have been conducted at the Garforth farm of the University of Leeds. The records extend for three years and include 70 completed periods of lactation (34 cows), of which 57, each extending over six months or more. The following is the summary arrived at:

With regard to the rate at which the milk yield falls with advance of lactation our records indicate that after the first two or three months this is much more rapid in the case of cows calving in the months March to June than in the case of cows calving at other times of the year. The greatest average yield for the whole period of lactation was obtained with cows calving in January and February.

With regard to changes in the composition of milk our tests have brought out very clearly the fact that the variations in the composition of milk with advance of lactation may differ greatly in the case of the different cows, so that no precise generalization on the subject can be formulated.

Roughly speaking, however, the milk is richest in total solids, fat and albuminoids in the earliest and latest stages of lactation and poorest about the second or third mobth. The sugar content tends to decrease steadily with advance of lactation after the first month or so, but the proportion of ash remain approximately constant.

Maple Green Farm Holsteins

Offers for sale at reasonable prices a number of bull calves from record of performance dams and grandams with large records. I expect to be to Amherst Dairy test with the dams of these calves where they and their performance can be seen. For particulars write,

R. L. HICKS, Dalhousie Jct., N.B.

Farm Bookkeeping.

Farmersj Bulletin 511, of the U. S. department of agriculture, contains some interesting facts and recommendations in connection with bookkeeping on the farm. "That there are over six million farms in the country which utilize land, labor, and capital as means of income making" gives the author, the opportunity to discuss the subject of the value of the farmer keeping an accurate and systematic account of his farm management the same as the business man or the railroad magnate.

This bulletin is not an attempt to outline a system of bookkeeping for the farmer. It is rather a discussion of the principles which are applicable to accounts on the farm. It is believed that any farmer who studies this bulletin sufficiently to grasp these principles will be able to devise a system suited to his needs.

Two important points must be considered in an attempt at farm bookkeeping. What does it cost to produce farm products? By selling at market prices, what profit is made on them?

"The problem of the farmer is to meet conditions on his own farm in a way which will give him the greatest net returns for his labor and the use of his capital. He should receive interest on his capital as well as wages for his labor, but owing to the lack of proper records few farmers know what wages they actually receive. There is reason to believe that the majority of farmers are really living on the interests of their investments rather than on the profits of their farm."

These suggestions are offered.

(1) Consider as one unit all that may be termed real estate, as land, farm buildings, fences, ditches, etc., whether the farm is rented or owned by the operator.

(2) Do not consider that the farmer or his family receive anything for their labor unless they are paid in cash the same as hired labor. If there is a surplus at the end of the year, it is their compensation. In this way the accounts will not be confused with items not strictly cash.

(3) Farm products used by the household should not be credited to the farm in the cash account along with the products sold, but should be taken care of separately.

Working up a Private Trade.

We had always sold to the stores at unsatisfactory prices, so I decided to try a scheme that I was sure would work. I had printed 1000 slips like this, 2½ by 5½ inches in size, and put

HOME CREAMERY
Made of
SEPARATED JERSEY CREAM
by
Mrs. W. W. SHEPHERD, Holtville, Cal.

one on each pound of butter and took it to the store as usual for three or four weeks. Then we changed to another store and the fun commenced, as the users called for our butter. They were told that none had come in this week. Another lot of families got to try it from the other store.

Then as we went to town we were hailed by friends and strangers to know if they could arrange to get butter each week from us. Of course we were only too glad to say yes, and when they asked the price we told them it would be the same as they would have to pay for "creamery" from the store. They have always been willing to pay the price and glad to get the butter.

You may be paid $50 in Cash for improving your walk like this

108 Canadian farmers will receive cash prizes (twelve in each Province) in our big

1912 FARMERS' PRIZE CONTEST

WE held a contest last year in which 36 prizes were offered. This year there will be three times as many prizes (108) and therefore three times as many chances for you to win one of them. You do not have to use a large quantity of cement to win a prize. Many of last year's prize-winners used comparatively little cement.

THE contest is divided into three classes and in only one of these (Class "A") does the amount of cement used count in deciding prize winners. Class "B" is for doing the *best* concrete work (the size makes no difference). Class "C" is for sending in the best and clearest *description* of how any piece of concrete work was done.

THERE will be four prizes (First, $50; Second, $25; Third, $15; Fourth, $10) in each class in each Province. Thus you have only to compete with other farmers in your own Province, and not with those in all parts of Canada. This gives you the best possible chance to win a $50 prize.

IT COSTS NOTHING TO ENTER—There are absolutely no "strings" to this offer. There is no entry fee or red tape to bother with. You cannot lose, because the improvements you make of concrete in competing for the prizes will be more than worth their cost. We have a book, *"What the Farmer Can Do With Concrete,"* that will give you all the information about the use of concrete you can need. It will be sent to you free when you ask us for complete particulars of the Prize Contest. Ask for particulars to-day. Just say "Send me, free, your book and full particulars of the 1912 Prize Contest," on a post card and mail it *to-day*. Address Publicity Manager,

Bulls at Large.

It has always been my experience that bulls that are regarded as quiet are most often the ones that do damage. I know, as doubtless do all in the country who are among cattle, many wno have been injured by bulls and have known of several being gored to death. In a case which happened in my knowledge recently, there had never been any trouble with the bull, and he was always regarded as a very quiet animal, which is one more proof of the fallacy of the idea that quiet bulls are safe and can be trusted; they cannot, although they are regarded as safe and are trusted in their quietness and docility by a great many stock-keepers. These quiet and docile animals are just the ones that do most damage and the reason is because they are trusted and have their liberty, and when one makes up his mind to attack, or when he suddenly becomes vicious, man is usually defenceless. We know that there are many quiet bulls driven about which never cause trouble to anyone. We know, too, that given their liberty, vicious bulls would do far more damage than quiet ones, but these vicious ones are never given the chance to attack anyone, while the quiet ones are, and they are liable to turn vicious at any minute. Wherever bulls are at liberty persons driving them should be well prepared for defence, and farmers know that a hay fork is one of the most effective means of driving or taming a vicious bull, and something of the sort should always be used when bulls are being driven about.—M.

Uniformity in Candian Dairy Products

A few months ago there was held at Ottawa a conference of dairy experts and officials from all parts of the Dominion. The meeting was called by the Honourable, the Minister of Agriculture, for the purpose of endeavoring to perpetuate the uniformity in quality and character of Canadian cheese and butter that has been responsible for the success of Canadian dairying. As pointed out by the Dairy and Cold Storage Commissioner, who presided over the Conference, many things come up in the practice of dairying over which slight difference of opinion may arise so that it seems desirable to bring together from time to time those in charge of dairy schools, and the chief instructors, in the various provinces, to discuss methods and practices, in order to arrive at some agreement of dairy advisors. The Conference lasted two days during which time many matters of importance were taken up and freely discussed. Some of these were the pasteurization of whey, factory hogs, testing and grading cream at cream gathering creameries, whey, refuse in relation to tuberculosis in butter, methods of paying patrons of cheese factories and other subjects relating to the production of butter and cheese. For the information of buttermakers and cheesemakers, and others interested in dairying, there has been printed in verbatum report of the proceedings of this Conference. Copies may be procured by applying to the Publications Branch of the Department of Agriculture, at Ottawa.

Superiority of Aged Brood Sows.

The keeping of old sows as breeders is a debateable question. Many farmers claim that it does not pay to keep sows over, that gilts are just as good and that the feeding of old sows from June until December merely to raise a litter is not profitable. It does cost something to feed the old sows, but by allowing them the run of good pasture very little grain is required. They are far superior to gilts and I have had experience with both.

An aged sow's litter is worth as much as those of two gilts, when raised. The gilts have more or less trouble in farrowing. They will bring forth a dead pig and a couple of weak ones that may probably survive, but never amount to anything. An aged sow rarely has any trouble, and produces more pigs and stronger ones.

With aged sows an aged boar may be used, which is not possible with gilts, unless a breeding crate is provided. By using more mature breeding animals, stronger offspring will be the result. Stronger pigs mean that a larger per cent. will be raised, fewer runts and larger profits.—J. E. Connell in Breeders' Gazette.

"It is a pleasure to tell you that Chamberlain's Cough Remedy is the best cough medicine I have ever used," writes Mrs. Hugh Campbell, of Lavonia, Ga. "I have used it with all my children and the results have been highly satisfactory." For sale by all dealers.

Peep again in your oven.
See those loaves, those *pleasing* loaves you've made.
How *fat—rounded—substantial.*
No, they *wont* fall when colder.
Because the *Manitoba strength* that is in FIVE ROSES will hold them up till eaten.
This sturdy *elastic* gluten has kept them from dropping *flat* in the oven.
No unsightly holes 'twixt crust and crumb—*never.*

That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

THE MARITIME FARMER, SUSSEX, N. B.

"It Took Me Fifty Years to Know How to Give You Better Roofs than any other Man"

"I tell you, every farmer in Canada should realize the big share a good roof has in making a good barn. That is my life-work—making roofs. I have been making my roof better and better for more than fifty years. What I have done for farm roofs is one of the biggest things ever done for people who farm."

"You ask me why a barn roof is so important. I will tell you. You build a barn and expect the roof to protect it many years. You put thousands of dollars' worth of produce under that roof while it lasts. Every pound of this produce costs you hard work. If a poor roof lets it get spoiled by wet, you lose money year after year. This lost money is many times the roof cost. Some roofs will last for several years. Some roofs will last if they are kept painted. But a roof is mighty hard to get at. It is not too safe to work on anyhow. Once a roof starts to leak, it is often left as it is. The result is the things you have in your barn spoil. This is lost money, and soon amounts to more than the cost of a good roof."

A Roof for Any Man

See What a Good Roof Can Do!

"I have spent my life making a low-cost roof that any man or his tinsmith could lay right. This roof of mine saves the stuff stored under it. It saves the barn framing and beams. It saves the foundation. This roof of mine doesn't need special roof timbering at all."

Good for 100 Years

"The big point about my roof is that it cannot develop leaks after you have had it up a year or two. It is a real roof from the first year it is on your barn to the last year. And do you know when that 'last year' will be? You will use that barn, and your son will use that barn, and your grandson will use that barn before that 'last year' comes. I want to pound the fact home to you that when you get a roof from me, you get a roof that is good for one hundred years. Think of getting a roof that makes your barn good for a hundred years. And that at about the price of an ordinary roof."

"That is why I say, 'I have helped the farmer more than any man ever did.' My roof will protect a good $100,000 of produce in your barn in 100 years. A roof that will do that is worth going after a good long ways."

Stands the Arctics

"This roof is so good that the Canadian Government Bernier Arctic Expedition used it for the Arctic regions. Here is immense cold and sweeping winds and ice and poor foundations to stand up under. The North-West Mounted Police use it. The Canadian Government has found no better roof for them. My roof is a good roof for the Arctic Circle. It is a still better roof for milder climates elsewhere."

Stands the Tropics

"But that is not all. My roof is used in the West Indies. Here is a temperature of 135 degrees at Porus, Jamaica. My roof stands it. In Jamaica during rainy season at Montego Bay, rain falls 10 inches in a single day. My roof stands it. In Ontario rain falls 30 inches in a whole year. My roof in Jamaica stands in 24 hours the rainfall it has easily 4 months for in Ontario. Is that a good roof? Is a roof that stands the severe conditions in both Arctics and Tropics good enough for you? You get exactly the same article, made on the same machines."

Used All Over the World

"Not only that, go down to South Africa. Go to the farms there. Go around Port Elizabeth, or Durban, or up in the Transvaal. You'll see my roof there. People will go around the world for my roof, because it is the best roof in the world. It will last 100 years. People use my roof in Japan—an earthquake country. They get it from me. They have searched the world for a roof that would stand earthquake straining. My roof will."

This Took 50 Years

"You are beginning to see something of the big work I have done. I have made a low-cost roof that stands terrific cold and heat, that stands tremendous rains, that stands ice, that stands earthquakes. In fifty years, I have made Pedlar roof better and better by little points added every year. It has world sales to-day, just because it is the best roof in the world at its very moderate price."

MY LATEST TRIUMPH

"Then, a few years ago, I put my finishing touch that made my roof wonderful. I had been troubled, not by my roof design, but by the metal in it. It seemed impossible to get a metal which would not rust. I had to take the best metal I could get. The design was all right. I had been making that design better for fifty years. At last I struck a clew in Europe."

"You know they have cathedrals there that are hundreds of years old. Yet the iron hinges on the doors are as good as ever to-day, though they were hammered out hundreds of years ago. I said to myself, 'Why not make up my roof in this peculiar kind of iron, so my roof will last like those door hinges?' Well, sir, that was a hard job. It was hard to get that iron duplicated. I worked for a long time and my chemists worked with me to get it. I stuck to it just as carefully as I had stuck to bettering my roof. And I got it at last. That's the metal I use to-day."

You Get the Benefit

"My roof is the only roof in the world with this kind of non-rusting iron in it. I am the only man a farmer can come to and say, 'I want a hundred-year roof at about the price I would pay for cedar shingle.' I am the only man that can deliver that kind of goods.

"My roof will not rust to the leaking point within 100 years. It saves the barn and its product from the weather. It saves the barn from thaw-water and lodged ice, because the seams cannot be gouged apart. It saves the barn from fire, because sparks cannot burn it. A burning stick on the roof will not harm it, or harm the barn under it. Lightning cannot burn a barn with my roof on it. My roof is a perfect conductor of electricity. My roof has 'give' in it to defy heat and frost, and protects in winter and summer. It protects even though the rafters sag. Wind cannot blow my roof off a barn. This is because it is a ventilated roof. It keeps your barn ventilated and stands the heaviest winds safely."

Get My Barn Book

"I want to send you my book, 'ROOFING RIGHT.' This lets you dig into more facts about the Pedlar roof. You will see how clean it is. It gives the best cistern water you can gather, as it is self-cleaning. This book shows scores of good barn designs—the best barns in Canada. Every one has my roof on it. You will get big help from my book, and I will send it free for a post-card, because you can plan your barn from it, whether you use my 100-year roof or not."

326

"I am the best friend the farmer has, because I have given him one of the best roofs in the world at a very low cost. I want to send out more of my barn books, because I want to see good barns built. I send a book free to you, if you will ask for it. Write me to-day."

OUR SPECIAL CHRISTMAS AND The MARITIME WINTER FAIR NUMBER

MARITIME FARMER

AND CO-OPERATIVE DAIRYMAN

Library Univ of Illinois
Jan 13 University Sta
Urbana Ill

Published Twice-a-month in the Interests of the [illegible] the Maritime Provinces of Canada.

Vol. 18. SUSSEX, N. B., DECEMBER 10, 1912 No. 5

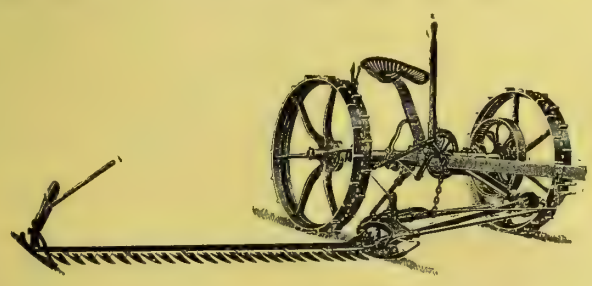
Remember "Frost & Wood." It Means "Quality"

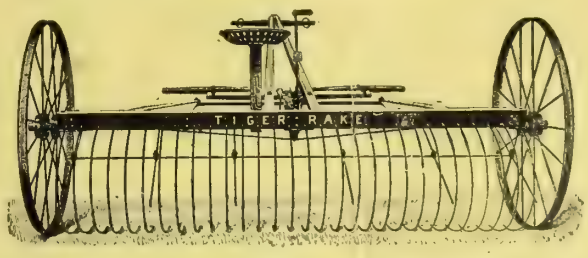
"QUALITY"—that's the word to apply to the kind of implements and machinery that save worry and trouble on the farm. Remember, a pretty machine may not have quality. A machine with a lot of "wrinkles" may not have qualjty. The material and actual working design may be so poor it is forever breaking down.

To buy right, you have to work from the reputation of the maker. The Frost & Wood industry has 70 years of experience, 70 years of "quality" construction 70 years of good-will and good reputation behind it.

Every Frost & Wood product is made with a view to maintaining that generation old confidence. These mowers and rakes are among the very best of their kind. With them you get things "done" on time and swiftly.

Send for Frost & Wood catalogues. Put thinking and judgment into your Spring buying by a Winter of careful consideration.





THE MOWER THAT ALWAYS IS READY FOR BUSINESS

THE "Frost & Wood" Mower has a long pitman, driven by an inside pinion working on an inside rack on the main wheel. The pinion has 3 teeth meshed with two rack teeth. The wear is divided and reduced. An outside rack and pinion would have one rack tooth grinding on one pinion tooth at a time, with great wear. See what you save?

You can't clog a F. & W. Mower. The knife moves instantly. Result, combined with the long pitman is swift, easy cutting for years and years of service like a new mower.

Roller bearings? Yes. Foot-lift for cutter bar? Yes. Easy levers? Yes. Easy oiling? Yes. Every modern convenience is in the F. & W. —and a 70-year reputation behind it. Send for catalogue of sizes.

THE RAKE THAT REALLY LASTS A LIFETIME

THE "Tiger" Rake is simple and strong, with steel wheels and superior non-breaking steel teeth that slip over the ground. The trip is easy, with a high lift, and undercleaners. The tooth-bar is steel, with a truss on the larger sizes. It handles timothy clean. Windrows of timothy may be easily bunched without dragging or clogging of the rake. We have made this rake as well as all our skill and facilities and experience can attain. It is weather proof, proof against hard usage, always ready for hard service and good work. Send for catalogue.

Write us or see our agent for any farm implement you need. Plan in Winter for Spring buying, instead of buying in haste and paying by years of dissatisfaction

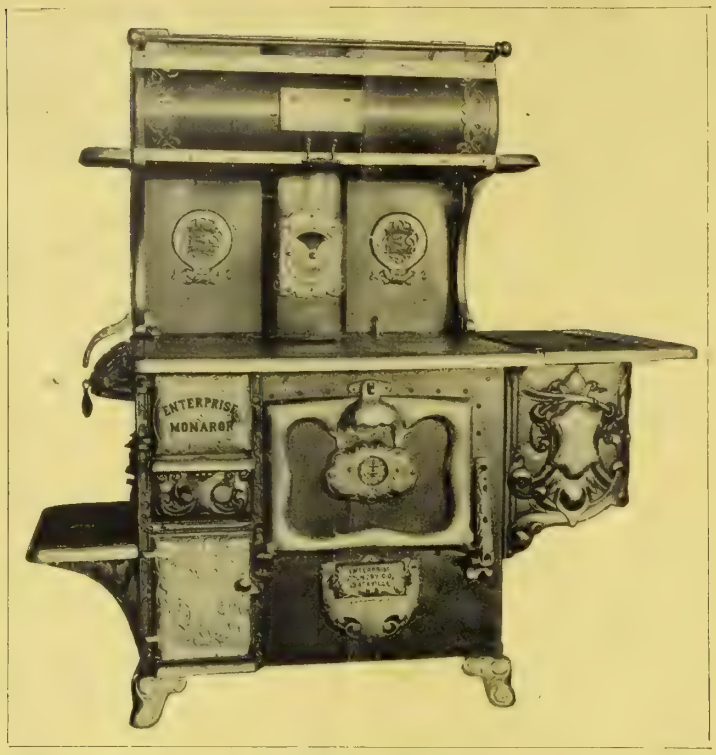
CANADA'S FINEST STEEL RANGE

The ENTERPRISE MONARCH



--Just the thing for the Farm House--

It is no light "mail order" Stove, but a substantially built, high grade one that will stand the wear and tear of years of use.

It can be relied upon to bake perfectly at all times. It is easy to operate—there are no complicated dampers. For wood burning, it has a very large fire box that will hold the fire many hours.

A Copper reservoir that beats anything on the market, as it is very large (holds 9 Imperial gallons) and cannot burn out.

No need for new fire box linings. They are especially heavy and well ventilated and will last a long time.

Then the **MONARCH** is moderate in price, costing no more than many inferior ranges. **A WRITTEN GUARANTEE WITH EACH ONE SOLD.** You run no risk.

There are so many features of interest to careful house-keepers that it is impossible to describe them in this limited space; but we have an eight page circular, which will explain them fully.

Drop us a card to-day for this, and it will go to you promptly. We know you will be interested, whether you are ready to buy now or later.

Mail Coupon Now for Catalogue

BEATTY BROS., Limited, 418 HILL ST. FERGUS, Ont.

Please send me your Catalogue of BT Manure Carriers, and quote me a price on a complete Manure Carrier Outfit.

I will need about ..... feet of track.

Name .....

P. O. .....

Province .....

BARN CLEANING Made Almost Automatic---Read The Proof Here NOW

You can lower the BT Manure Carrier right down to the gutter, and easily pitch half-a-ton of manure into the big wide-mouthed bucket---an easy shove sends this big load away out from the barn and you can dump it into the sleigh or wagon, or on the pile, in a minute.

Isn't it easy---there's no hard work about it at all---it's a snap even for your boy. Get him a BT Manure Carrier, and he'll be glad to do all the stable work. He'll like to do it, where your strong man hated it before.

And the best of it is, your manure carrier makes a far cleaner job. There you have a big wide-mouthed bucket, lowered close to the floor, behind the stalls. It's easy to fill it with the liquid as well as the solid manure---the galvanized water-tight tub, keeps all this until you reach the pile rods from the barn---there's no dripping or slopping along the passage way at all.

If you could read the hundreds of letters we receive in praise of the BT Manure Carrier, you would agree with us that it makes your barn cleaning automatic---and you'd be glad to write for our Catalogue and read all the facts about the BT Carrier.

The BT MANURE CARRIER

The BT Carrier means so much to you that you cannot afford to ignore the facts. Think ! In one big load it cleans your stable—the whole thing is done in a minute—only one trip out into the yard. That's worth something when it's bitter, icy, cold. And then you get the manure a good distance from the barn, where it can't rot the sides of your barn, or injure the health of your stock by the fumes given off.

Write for our Catalogue—we want you to read of the value and superiority of the BT Carrier. Know why it is the choice of the best farmers and dairymen all over Canada. Know why it is used exclusively on all the big Government Farms. Read about the BT Hand Wheel Windlass, the Friction Brake, the Latch, and Latch Trip, the Track and Hangers—Investigate all the superior qualities that make it years ahead of other styles.

Mail Coupon Now For Catalogue

This is the best time of the year to install your Manure Carrier—right now, while the work is slack. Our Catalogue gives you complete instructions, so that you can go ahead and quickly put up your Outfit. Don't delay. Be ready for the heavy stable work, in the January and February months. You ought to have our Catalogue. It proves to you that a BT Manure Carrier is the best investment you can make and pays for itself, before the winter's over, in all the dirty, disagreeable, tedious work it saves.

Send us the coupon NOW, and get our Catalogue by return mail.

DE LAVAL
CREAM SEPARATORS

THOSE WHO KNOW
BUY DE LAVAL SEPARATORS

Creamerymen—Because they are experts in the handling of cream and know by long experience that the De Laval skims cleanest and wears longest. That is why 98 per cent. of the world's creameries use the De Laval exclusively.

Experienced Dairymen—The De Laval is the universal favorite among big dairymen. They know that no other separator will give them such satisfactory service.

Old De Laval Users—Whenever a man who has used an old model De Laval decides to purchase a later style machine he invariably buys another De Laval.

Men Who Investigate—If anyone takes the time to investigate the merits of the various cream separators, either by finding out from other users what kind of service their machines have given or by testing other macihnes out against the De Laval, the chances are a hundred to one that his choice will be the De Laval.

More De Laval machines are in use than any other make. There is a reason. Any De Laval Agent will tell you why or write to the nearest De Laval office below.

Volume 18. **SUSSEX, NEW BRUNSWICK, DECEMBER 10, 1912.** **Number 5.**

A Business Man With a Business Herd

Business Methods in the Management of J. D. Irving's Sea View Farm, Bouctouche, N. B.

ABOUT 38 miles from the railway city of Moncton at the eastern terminus of the Moncton and Buctouche Railway is situated the thriving, pretty village of Buctouche, made famous the world over by the quality and quantity of the Buctouche Bar oysters, which are annually shipped from its extensive beds.

As soon as Jack Frost bridges the river, its surface presents an animated scene as a harvest of thousands of dollars are annually reaped from its smelt fisheries.

At other seasons of the year lobster, mackerel and other fisheries bring handsome incomes to the toilers of the deep.

The lumber interests also afford vast fields for the employment of labor and during the winter months, the lumberman's axe rings out a merry tune as the giants of the forests are being felled and made ready for floating to the busy mills at tidewater, in the village, where a large number of hands are employed in preparing the various grades of sawn and round timber for foreign markets.

Lumbering and fishing do not, however, comprise all of Buctouche's natural resources for the charming village is located in the very heart of one of the most promising agricultural districts in Eastern Canada. There are miles and miles of level or gently undulating land, which is entirely free from stone and which is easily worked. The creeks and rivers have a wealth of mussel mud which can be easily dredged and which is now being extensively used as a fertilizing element for the various farm crops.

There are few, if any sections of the Maritime Provinces where wheat is so extensively grown as in the county of Kent, where no fewer than five large, modern grist mills are to be found busily grinding the golden grain.

The rapidly growing city of Moncton affords a good market for all kinds of farm produce. The citizens of Kent County can truthfully exclaim "verily our lot has been cast in pleasant surroundings."

A BUSINESS MAN'S BUSINESS METHODS.

We would not be amiss in saying that the most industrious and energetic citizen of the delightful village is Mr. J. D. Irving, who when quite a young man recognized the merits of that portion of Kent County and who having seen behind the veil has been largely instrumental in developing its natural resources.

Of good old Scotch descent Mr. Irving was born and spent the early part of his life at Galloway, about eight miles from Buctouche, where his father carried on farming operations on a large scale.

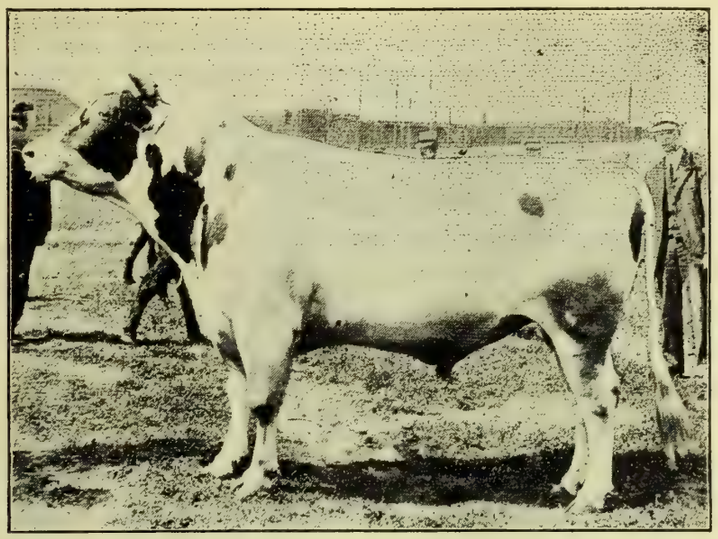
Mr. Irving's grandfather, a brother to the Irvings who built the famous Annandale dykes in Scotland, emigrated from that country and first settled near the headwaters of the Richibucto River. The Mr. Irving of our sketch came to Buctouche about thirty-two years ago, where he established a general mercantile business in the conducting of which he met with a goodly share of success. Today his stores are the most complete and up-to-date in the village.

The establishing of a mercantile business led on to trading in lumber and finally to conducting extensive lumbering operations, until the Irving saw mills became the largest and best equipped in Buctouche and furnish employment for a large number of men.

The products of the deep also engaged Mr. Irving's attention and in the course of time he has established a large cold storage plant and an export trade of no small dimensions.

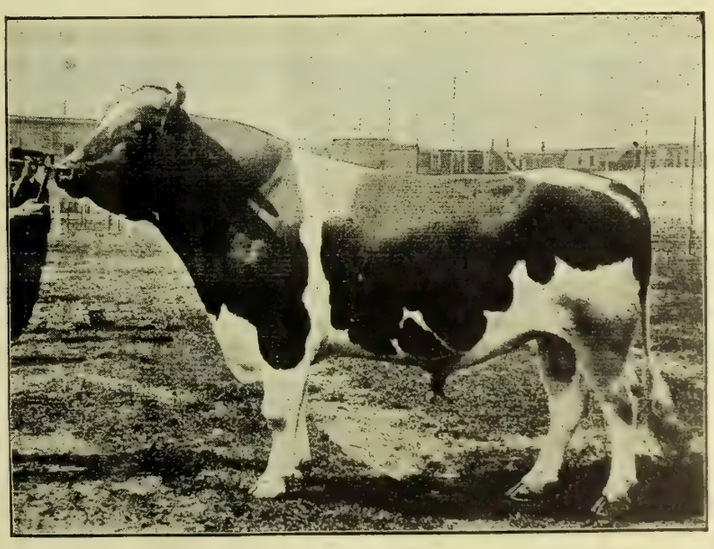
We have already stated that a considerable quantity of wheat is grown in the vicinity of Buctouche, to cater to the producers of which the Irving Mills were established about 14 years ago. They have a modern equipment and upwards of 50,000 bushels of home-grown wheat are annually converted into flour of the best quality, which is eagerly bought by the residents of the district in preference to any other brand.

Irving's carding mills are also a great convenience to the sheep-raisers of the surrounding district and to the industrious housewives, who have not forgotten the art of home manufacturing cloths and knitted goods of various kinds.



Count Tensen A.

Champion Holstein Bull at the 1912 St. John and Halifax Exhibitions. Owned and exhibited by J. D. Irving, Sea View Farm, Buctouche, N. B.



Lord Seaview Rooker

Reserve Champion Holstein bull at the 1912 St. John and Halifax Exhibitions. Lord Sea View Roker, has recently been sold to the North Sydney Agricultural Society. Bred, owned and exhibited by J. D. Irving, Buctouche, N. B.

A BUSINESS MAN'S FARMING OPERATIONS.

There is, however, no line of business in which Mr. Irving is more interested than in farming and to this occupation he has applied the same business methods that he applies to his other industries.

From the beginning of his career in Buctouche, Mr. Irving has been carrying on farming operations. His residence and barns are located on Sea View Farm, a gently sloping block of sixty acres of clay loam. Another block of fifty acres is near by while across the river there is still another block of sixty-five acres.

The various blocks are laid out in nice, large fields and a systematic rotation of crops is followed. The pastures are all located on the home block.

The refuse burned at the mills af-

fords enough ashes to cover about twenty-five acres each year. A large quantity of oyster and clam shells are also burned among the mill refuse and are thus made available for fertilizing purposes. Some 400 to 500 loads of mussel mud are yearly dredged from the river and spread as a topdressing on the fields at the rate of about twenty loads per acre. The afore mentioned materials coupled with good crops of clover supplement the manure from a large herd of pure bred Holstein cattle, seven horses, about fifteen Yorkshire hogs and a large flock of Barred Plymouth Rock and Rhode Island Red poultry in the upkeep of the Sea View Farm acreage.

A long row of stalls, to accomodate the horses of the public who patronize the stores and mills, have been built by Mr. Irving and he finds that the amount of extra manure thus collected in the course of a year gives a handsome income on the money invested in the sheds.

A thrifty young orchard is fast coming into bearing on Sea View Farm; which, coupled with a well kept kitchen garden afford many delicacies for the table, which are not so frequently found in our rural homes as they might be.

The residence, which is prettily located amid surroundings of well kept lawns, trees, shrubs and flowers enclosed by an artistic fence, is heated by the exhaust steam from the grist mill, which is located about 500 feet distant.

The steam is also conducted to the barns and is used for sterilizing the milking utensils, separator, calf feeding pails, etc Mr. Irving is now installing a large steam chest in which he purposes to steam cut straw for the cattle. The cut straw and short feed for the morning meal will be steamed at night and vice versa.

THE SEA VIEW FARM ROTATION

is as follows:—

Sod lands are ploughed in the Fall and topdressed in the Winter or Spring with mussel mud or barnyard manure and the first crop is oats.

The oat stubble is again topdressed the following Spring and wheat is sown. Timothy and clover seed is sown with the wheat at the rate of fifteen pounds per acre. In some cases, the timothy and clover is omitted and, in such cases the wheat stubble is topdressed in the Fall and in the following Spring the land is again topdressed and a crop of corn or roots follows.

The roots and corn are followed by wheat seeded with timothy and clover at the rate already mentioned. The land is then devoted to growing hay for two or three years after which it is again broken for oats and the rotation is again repeated.

At the time of our visit to Sea View Farm the root cellars were filled to overflowing with turnips and mangolds. We saw a well filled silo, which was built last summer to take care of a good crop of corn.

In years gone by the corn was fed green from the field but now, being preserved as ensilage it will be used alternately with the roots and to bridge over the season between the time the roots are used up in the Spring and the season when soiling crops are ready for use in Summer.

The lumbering operations call for a large number of heavy horses and to cater to this trade a pure bred Clydesdale mare has been imported from Scotland and will be used as the foundation for a suitable class of horses for this purpose.

Mr. Irving has been particularly successful in his choice of men to head the various industries in which he is interested. As a proof that the men are well used one has only to look over the long service records of the various foremen in his employ. David Evans, the efficient and trusty farm foreman, has been in Mr. Irving's employ for upwards of fourteen years. John McClintick, the herdsman, has been in charge of the herd for less than a year. He came to Sea View Farm after serving a long apprenticeship in the Dominion Experimental Station barns at Nappan, N. S., the Nova Scotia Agricultural College stables, Truro, N. S. and with Logan Bros., Amherst Point, N. S. Mr. McClintick's experience with the latter firm in caring for and fitting their large herd of Holsteins makes him a valuable asset in the upbuilding and maintenance of

THE SEA VIEW FARM HOLSTEINS

From a beginning with a herd of grade dairy cows and the trying out of the relative merits of several of the pure breeds Mr. Irving's choice finally fell on the Holsteins.

About seven years ago he bought the pure bred yearling bull, Togo Rooker, from Logan Bros. At the time this purchase was made there were three bulls in the same pen. Togo Rooker was the smallest one of the trio and naturally Mr. Irving was inclined to choose one of the larger bulls but as Mr. Logan recommended the smallest bull as being the most promising one in the bunch he followed the advice of the experienced breeder and never had cause for regret. At the Dominion Exhibition, in Halifax, three years ago, Togo Rooker, in strong competition, captured the male championship of his class.

Shortly after the purchase of Togo Rooker, the Homestead herd was again visited and the prize winning cow, Sijbrandij Rooker and a promising young heifer were added to the Sea View herd. Two prize winning young heifers, Lola Queen and Minnie Burke, from the herd of Neil Sangster, Ormstrong, Que. were next added to the herd.

Two years ago the Homestead herd was visited and once again the Sea View herd was strengthened by the purchase of the prize winning heifer, Jacoba Emiline.

Last summer the five year old cow, Rose of Bonheur Beauty, a Toronto prize winner, bred by W. Smith & Co., of Ontario was purchased from Logan Bros. In the Irving herd this cow captured the female championship at St. John, in 1912. The two-year-old heifer, Dorindo Vale, was also purchased from Logan Bros. last summer. Dorindo Vale was the first prize senior yearling heifer at Halifax in 1911 and in her two-year-old form was successful in capturing the female championship at Halifax having gone a notch higher than at St. John where she was reserve champion. Dorindo Vale is by Mercena Vale, the champion Holstein male at the Toronto exhibition.

The original herd header, Togo Rooker, having met an untimely death about two years ago, another herd header, Count Tensen A. was purchased for the Sea View herd by Mr. R. S. Stevenson, the popular Holstein judge, of Ancaster, Ont. from the herd of A. Hulet, Norwich, Ont. Count Tensen A. has made good and carried off the male championships at both St. John and Halifax Exhibitions in 1912. The reserve honors in the same class at both fairs went to the Sea View bred bull, Lord Sea View Rooker, shown in the Sea View herd.

The Sea View herd now numbers about forty head of typical pure bred Holsteins. The herd is managed in a business-like way—the milk from each cow is weighed every night and morning and is frequently tested for butter fat content. In this way a close watch is kept on the performance of each cow. When an intending purchaser visits the Sea View stables, he can refer to the performance records of the various cows in the herd and so if he is a discerning buyer will see that he is buying something that comes of a producing family. Buyers of pure bred stock are getting schooled up to be more and more discriminating as years go by, so like Mr. Irving the wise breeder will keep an accurate record of the performance of the various cows in the herd. We had an opportunity to look over the record sheets in the Sea View stables and noticed that the herd, as a whole, are doing good work at the pail and that the average test is somewhat better than 3 per cent. Several cows show butter fat tests of 4 per cent. or better.

A very promising young cow is the three-year-old Sadie Rooker whose dam is Lady Mary Rooker, champion in the New Westminster milking test in 1911. Sadie Rooker has a record of 63 pounds 3.8 per cent as her best achievement in one day during her first lactation period.

FEEDING SYSTEM.

At five o'clock in the morning a quantity of hay is fed and then the stables are cleaned. Milking is commenced at 5:30. After the milk is separated turnips and grain are fed.

The Newfoundland Poultry Show

Specially Reported by one of the Staff

THE first poultry show ever held in Newfoundland, Britain's oldest colony, was held under the auspices of the Newfoundland Poultry Association in Arcade Hall, St. John's on November 20th, 21st and 22nd.

A Maritime Farmer representative visited the show and was highly impressed with the spirit of enthusiasm that prevails amongst the Newfoundland poultrymen. They are a lot of live wires and the rapid strides they have already made in the introduction and breeding of pure-bred poultry in the ancient colony as exemplified by the magnificent display at their first snow is an omen that spells s-u-c-c-e-s-s.

The officers of the Newfoundland Poultry Association are: President—Hon. Mr. Justice Emerson; Vice Presidents—Hon. W. C. Job and Hon. Geo. Knowling; Treasurer—Geo. W. Gushue; Secretary—W. Barker; Directors—Percie Johnson, A. McKeen, Howard Parsons, Walter Reid, and Otto Rusch.

The aim and object of the association is to foster and develop the poultry industry and arrest the enormous importation of poultry products. With the various officers of the association the work of looking after the details incidental to the carrying on of a first-class poultry show, is a labor of love for the various officers are willing to spend and be spent for the good of the cause which they have so whole heartedly espoused.

A great deal of the success already attained is due to Mr. Percie Johnson, that enthusiast of enthusiasts, who repeatedly visits the Maritime Winter Fair ever ready to glean ideas that may be applicable to Newfoundland conditions. He and his associates have worked nobly and well. Last year they induced Professor J. P. Landry, of the Nova Scotia Agricultural College, to visit St. John's and on his advice they have gone forward with the work of organizing a poultry exhibition and their labors have been crowned with success, far in excess of their most sanguine expectation and to the delight of the thousands of visitors who visited the show.

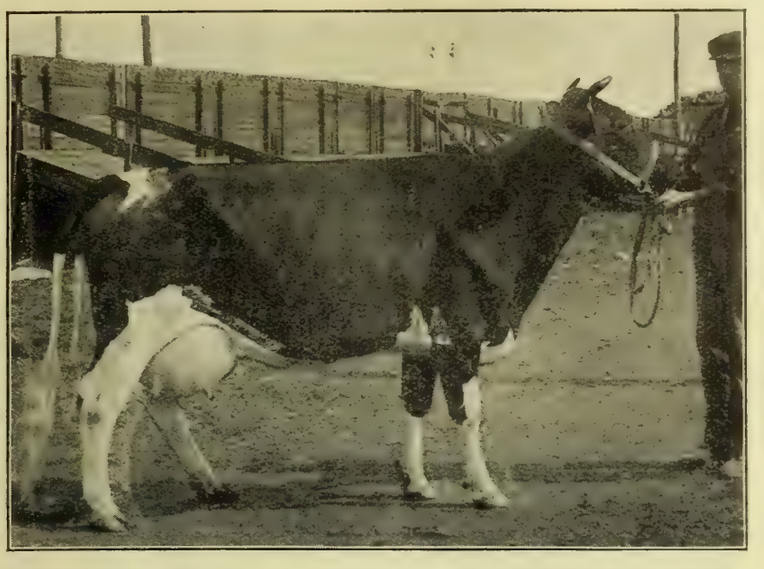
The result is, that numerous persons residing in St. John's and the various outports who had not hereto-fore taken any interest in poultry, were enthused by the display of birds and Professor Landry's illustrated lecture are already inquiring for eggs and birds and undoubtedly a year hence will see the poultry status in Newfoundland increased over 100 per cent.

Sir Edward Morris, the Premier of the Colony and the various members of the Board of Agriculture and other influential parties did all in their power to help make the show a success, viz: by giving a grant of $400.00 an array of silver trophies and many useful special prizes and also by being present and taking part in the proceedings at the opening and closing exercises.

Prof. J. P. Landry satisfactorily placed the awards in his usual pains taking manner and in so doing explained to interested onlookers the why and wherefore for every award.

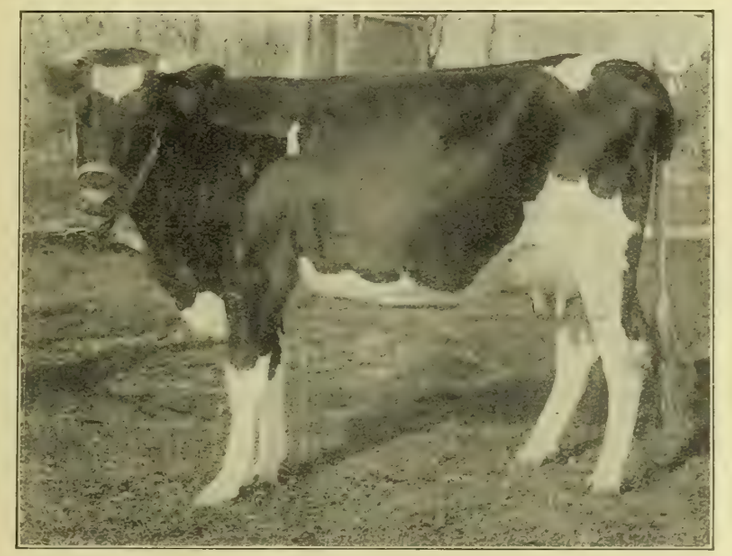
There were nearly 400 birds in the show, and attractively cooped as they were in up-to-date metal, wire fronted coops they reflected a great deal of credit on their owners and on the progressiveness of the various committees in charge.

Neat catalogues were distributed and every arrangement was in such a ship shape condition that strangers naturally supposed that the show had been an annual event for many years; great was their surprise when they were told that the 1912 show was the initial attempt.



Rose of Bonheur Beauty

Champion Holstein Cow at the 1912 St. John Exhibition and Reserve Champion at the Halifax Exhibition. Owned and exhibited by J. D. Irving, Buctouche, N. B.



Dorinda Vale

Reserve Champion Holstein Female at the 1912 St. John Exhibition and Champion at the Halifax exhibition. Owned and exhibited by J. D. Irving, Buctouche, N. B.

In response to the cry "Come over to Harbor Grace and help us" the poultry Association, at the close of the show induced Prof. Landry to remain in the colony a day or two longer and deliver a lecture in Harbor Grace, where he was welcomed by a large and appreciative audience who are becoming very much interested in the subject of more and better poultry.

With the exception of one or two entries the various birds in the show were well up to the standard. There were some birds in the respective sections that would be hard to beat in heavier competition. Some of them have been winners at some of the mainland shows but the great majority were home bred birds the progeny of stock and eggs imported from some of the most noted and successful breeders on opposite sides of the Atlantic.

Rhode Island Reds led the way in point of numbers with a total entry of 62 birds. White Wyandottes came next with an entry of 51 birds. Barred and White Rocks each had entries of 23; Black Orpingtons, 21; Buff Orpingtons, 19; White Leghorns, 19; White Orpingtons, 15; Silver Wyandottes and S. C. B. Black Minorcas, each, 14; Anconas, 11; Light Brahmas, 8; Brown Leghorns, 6; Bantams, 6; R. C. Black Minorcas, 5; Buff Leghorns, 4; A. O. V., 4; Columbian Wyandottes, 2; Guineas, 2; Bronze and Black Turkeys, 9; Tolouse Geese, 2 and a good aggregation of Pekin, Rouen, Indian Runner, Muscovey and Buff Orpington Ducks, of exceptionally high merit.

We were pleased to note that the majority of the exhibitors are close students of the Standard of Perfection and of the various Canadian and American poultry periodicals.

The competition was very close in some sections. The winning reds were red to the skin, the whites were pure white and the barred were barred. We predict that next year the Association must seek more commodious quarters to accomodate a larger number of entries. We compliment them on what they have already attained and wish them every deserved success in future years.

Following is a list of the awards;—

Prize Winners at the Newfoundland Poultry Show.

Light Brahma hen—1 and 2, Rev. J. J. Coady, Manuels.

Light Brahma cockerel—1 and 2, Frank Parsons, 54 Fresh Water Road, City.

Light Brahma pullet—1, Mrs. J. E. Rendell, Military Road, City.

White Orpington cock—1, Hon. Geo. Knowling, Waterford Bridge Road; 2, J. E. Dempster, Waterford Bridge Road.

White Orpington hen—1 and 2, J. E. Dempster.

White Orpington Cockerel—1, W. Campbell, Waterford Bridge Road; 2, Hon. Geo. Knowling.

White Orpington pullet—1, Stanley White, 8 Fresh Water Road, City; 2, J. E. Dempster; 3, W. Campbell.

Buff Orpington cock—1, Hon. Geo. Knowling.

Buff Orpington hen—1, Helen Parsons, Bellvue Farm, Old Placentia Road, City; 2, Hon. Geo. Knowling.

Buff Orpington cockerel—1, W. Barker, LeMarchant Road, City; 2 and 3, Heber Parsons.

Buff Orpington pullet—1, Heber Parsons; 2, W. Barker; 3, J. E. Dempster.

Black Orpington cock—1, Hon. Geo. Knowling; 2, Percie Johnson, St. John's; 3, J. E. Dempster.

Black Orpington hen—1, Stanley White; 2, J. E. Dempster; 3, Mrs. Tryphena Wyatt, 13 Monroe St., City

Black Orpington cockerel—1, J. E. Dempster; 2, Hon Geo. Knowling.

Black Orpington pullet— 1, J. E. Dempster; 2, Hon. Geo. Knowling; 3, A. G. Carter, 157 Water St., St. John's.

Barred Plymouth Rock Cock—1, Rev. J. J. Coady; 2, W. Barker.

Barred Plymouth Rock hen—1, Frank Bennett, 166 Duckworth St. City; 2, Rev. J. J. Coady; 3, W. Barker.

Larred Plymouth Rock cockerel—1 and 2, W. Barker.

Barred Plymouth Rock pullet—1 and 2, W. Barker.

White Plymouth Rock cock—1, W. Reid, Pleasant St. City; 2, John Duff, Carbonear; 3, Mrs. M. F. Smythe, Robinson's Hill, City.

White Plymouth Rock hen—1, 2 and 3, W. Reid.

White Plymouth Rock cockerel—1, W. Reid; 2, Mrs. M. F. Smythe; 3, Harris Thomas Jr., Carpasian Road.

White Plymouth pullet—1, Harris Thomas; 2, W. Reid; 3, Mrs. M. F. Smythe.

Partridge Wyandotte cock—1, H. W. F. Blackall, 23 Forest Road.

Partridge Wyandotte cockerel—1, H. W. F. Blackall.

Partridge Wyandotte pullet—1, H. W. F. Blackall.

Silver Wyandotte cock—1, Hector McNeil, 163 LeMarchant Road.

Silver Wyandotte hen—1, Hector McNeil.

Silver Wyandotte cockerel—1 and 2, Hector McNeil.

Silver Wyandotte pullet—1, 2 and 3, Hector McNeil.

Columbian Wyandotte cock—1, Stanley White, 8 Freshwater Road.

Columbian Wyandotte cockerel—1, H. McDonald, 174 Pleasant St. City.

White Wyandotte cock—1, M. McLeod, St. John's; 2, G. W. Gushue; 3, P. H. Hudson, Pennewell Road, St. John's.

Willow Glen Farm, the Home of Good Shorthorns

Produces Fruit in Abundance

WE had the pleasure not long ago of paying a flying visit to Willow Glen Farm, New Minas, N. S. New Minas is in Kings County and Willow Glen Farm is the steading of A. N. Griffin a prominent fruit grower and the breeder and exhibitor of the champion Shorthorn female at Halifax in 1912.

Mr. Griffin, from his earliest boyhood, had a liking for good horses and cattle and as a rule he keeps a trappy Standard-bred driver.

He began showing Shorthorns in the olden days when the shows were moved around alternately to Halifax, Truro and Kentville. On one occasion he exhibited a carload at Truro and succeeded in winning a prize on every animal in his herd.

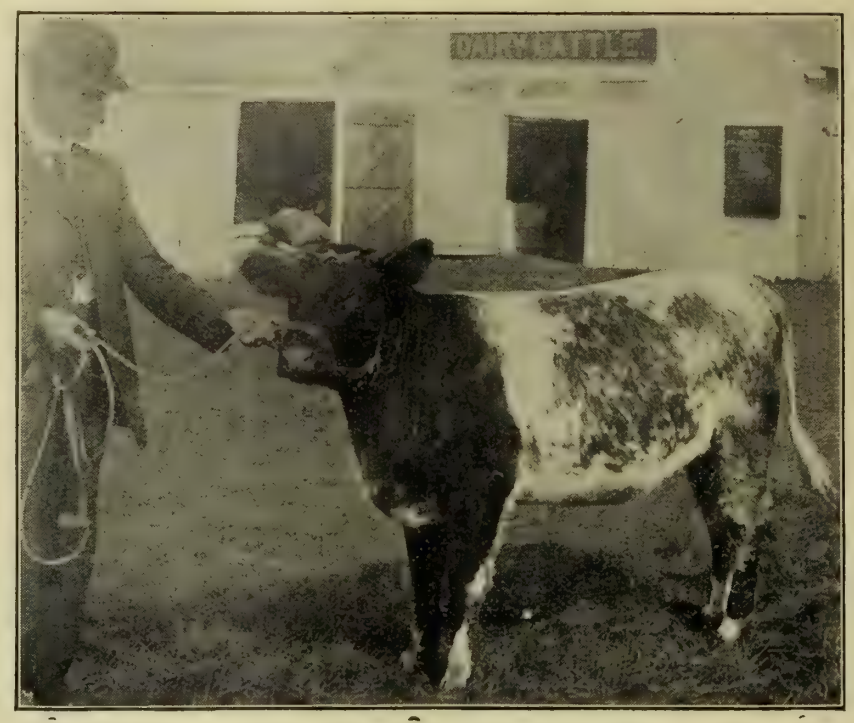
Mr. Griffin made several trips to Ontario for the express purpose of purchasing cattle for himself and others and also for his Agricultural Society. In 1903 he visited the Toronto exhibition, but did not purpose buying any stock at that time. However, Mr. J. M. Guardhouse invited him to visit his farm and look over his stock with the result that he purchased two cows and two heifer calves. He swapped off one of the calves for one of a different strain, a low, thick set calf about one month old which has proved to be a grand breeder.

Her name was Emma's Lass—55904—dam Emma's Lady by Nonpareil (imp) grand dam, Lady Emma (imp) a Marr Emma of the best Scotch breeding. The first calf produced by Emma's Lass was a male that in his calfhood carried off the first prize at the exhibition. This year she proproduced Emily of Willow Glen, the 1912 champion Shorthorn female at Halifax.

The other cow purchased with Emma's Lass was a Strathallan and the following year she produced the heifer, Rose of Willow Glen, which took third prize as a calf at the provincial exhibition that year and made a grand breeder. She dropped three bull calves on Willow Glen Farm and this year as a member of the Lawndale herd she won second prize in her class in strong competition at Halifax.

The calf purchased with the other cow won second prize as a five year old at the Halifax show after which she was sold to the Nova Scotia Agricultural College, Truro.

At the present time the Willow Glen herd contains three heifers, sired by Sensational—78480—the sire of the champion heifer, the first prize bull calf and of the first prize winning trio, get of one sire at a leading Western show last season.



Mr. A. N. Griffin and his Emma of Willow Glen
Champion Shorthorn Female at the Halifax Exhibition.

Sensational was sired by Hillsburg Tom—26756—a bull bought for the New Minas Agricultural Society from Mr. W. B. Watt, of Toronto. The year he was purchased he had won second prize at Toronto and London. He sired a lot of prize winners including the renowned show cow, Olga Stamford, dam of the Ohio, Indiana and Michigan state fairs, junior champion of last year.

At the time of our visit we also saw a cow by Deeside chief (imp) and one by Willow Glen Boy—75584—dam Willow Glen Lass—87702—grand dam Emma's Lass—55904. Emma's Lass had a nice heifer calf, a few days old by her side.

Another promising young heifer in the Willow Glen herd is Vangey—99970—sired by Lord Cornwallis, a bull whose dam won second prize at Halifax this year. On her dam's side Vangey traces back to Young Abbotsburn, a World's Fair champion at Chicago and also to Brampton Hero a champion and sire of champions.

Victor—84774—the bull used to head the Willow Glen herd this year was purchased last winter from Mr. John Miller, of Thistle Ha, Ont. Victor's sire was Woodfield Prince—75238—by Trout Creek Wonder—56167—by Prince Sunbeam (imp) a champion at Toronto and other shows, dam by Royal Prince (imp). Victor was sold recently to Mr. Isaac Chipman.

Another promising young cow, Willow Glen Lass, was recently sold to Mr. Lewis Chipman. Willow Glen Hero—86837—first prize bull calf at Halifax, a nice growthy youngster whose dam is Willow Glen Lass—87702—is offered for sale and should prove a valuable herd header.

Mr. Griffin again visited the Toronto exhibition, but did not purpose buying any stock at that time. However, Mr. J. M. Guardhouse invited him to visit his farm and look over his stock with the result that he purchased two cows and two heifer calves. He swapped off one of the calves for one of a different strain, a low, thick set calf about one month old which has proved to be a grand breeder.

Her name was Emma's Lass—55904—dam Emma's Lady by Nonpareil (imp) grand dam, Lady Emma (imp) a Marr Emma of the best Scotch breeding. The first calf produced by Emma's Lass was a male that in his calfhood carried off the first prize at the exhibition. This year she proproduced Emily of Willow Glen, the 1912 champion Shorthorn female at Halifax.

The other cow purchased with Emma's Lass was a Strathallan and the following year she produced the heifer, Rose of Willow Glen, which took third prize as a calf at the provincial exhibition that year and made a grand breeder. She dropped three bull calves on Willow Glen Farm and this year as a member of the Lawndale herd she won second prize in her class in strong competition at Halifax.

The calf purchased with the other cow won second prize as a five year old at the Halifax show after which she was sold to the Nova Scotia Agricultural College, Truro.

At the present time the Willow Glen herd contains three heifers, sired by Sensational—78480—the sire of the champion heifer, the first prize bull calf and of the first prize winning trio, get of one sire at a leading Western show last season

The Boswalls, a Family of Sheep Breeders

READERS of the Maritime Farmer who follow our reports of the various Maritime inter-provincial Exhibitions and Fairs are familiar with the names of Albert Boswall, Sr., Pownal, P. E. I.; S. L. Boswall, Pownal; A. H. Boswall, Marshfield; Albert Boswall, Jr., French Fort; Geo. L. Boswall, French Fort and Almon D. Boswall, Dunnstaffnage as breeders and exhibitors of various breeds of pure bred sheep. As successful shepherds the Boswalls have been prominently before the public for many years.

Albert Boswall Sr., emmigrated from Somersetshire, England, when four years of age with his father the late Dr. Boswall, of Prince Edward Island. About fifty years ago Mr. Boswall started in the business of sheep breeding with Leicesters, the breed of his choice which he has zealously followed for half a century.

His first exhibiting experience was at the county show where he exhibited one lamb. He kept on increasing his flock from year to year by the natural increase and by stock imported by the Prince Edward Island Stock Farm. In this way he soon fitted a flock of Leicesters that was hard to beat at any show. He exhibited at the great Dominion Exhibition held at Montreal and from there carried off a great many of the most coveted prizes and diplomas.

Shortly after the Montreal Dominion Exhibition Mr. Boswall purchased some Shropshire Downs and in a few short years he was able to show a flock of the breed at Charlottetown and was successful in carrying off a goodly share of the prizes.

Mr. Boswall Sr. has nearly always imported his stock rams from Ontario and occasionally from England and Scotland from the best and most reliable breeders such as John Kelly, A. W. Smith, J. M. Guardhouse, John Dryden, John Campbell and others.

About twenty years ago when St. John, N. B. threw its exhibition open to the Maritime Provinces, Mr. Boswall was for some years the only exhibitor of live stock from Prince Edward Island who took advantage of the opportunities thus afforded. He was quite successful from the very beginning in competing against some of the best Quebec and Ontario flocks. He made his first showing in Halifax in 1896 and has ever since been annually showing there with most gratifying success.

As the years rolled by and his sons grew up to manhood one after another decided to follow in their father's footsteps and engage in the sheep raising industry.

A. H. the eldest son, removed to Marshfield where he purchased Tulloch Farm from Senator Ferguson where he is now engaged in the breeding of Oxford Down sheep and Clydesdale horses.

S. L. remains with his father on the Pownal Farm where they still breed their prize winning Leicesters and Shorthorn cattle. Albert Boswall Jr. purchased "Harbor View Farm," French Fort, where he breeds Lincolns and Suffolks. The foundation of his Lincoln flock was a pair of ewes purchased from G. F. Bovyer. He then bought a first class ram from J. T. Gibson, Denfield, Ont. He has worked carefully and well until he now has the satisfaction of owing the champion ram, any breed in Maritime Canada.

The foundation for his suffolk flock was purchased in England at fancy prices.

Alfred Jr. is also a successful breeder of Bronze and White turkeys, White Embden and African Geese, Mammoth Pekin Ducks and White Plymouth Rock fowl.

Geo. L. Boswall, settled on Blackadder Farm, French Fort, and there he specializes in the breeding of Shropshire Downs and Horned Dorsets. He has built up his flock by the introduction of new blood from such noted breeders as John Campbell, W. Dryden, R. H. Harding and others. He too has been a successful exhibitor at the leading Maritime shows.

Almon D. Boswall the youngest son purchased Riverdale Farm at Dunnstaffnage about a year ago. He keeps a few nice Leicesters and Lincolns and his aim is to build up two good flocks. He also has a fine stud of Hackney horses on which he won three of the first prizes, a second prize and championship on carriage mares at the recent Cnarlottetown exhibition. He purposes exhibiting a stronger class next year.

The various members of the Boswall family are thorough shepherds. They find sheep breeding is a most profitable industry. They grow the hay, roots and grains required for the maintenance of their flocks on their respective farms. Their farms are free from weeds and the soil fertility is not being depleted as is too often the case where raw products are shipped from the farm. The Maritime Provinces as a sheep raising country is second to none. There are thousands of acres awaiting the touch of development that our young men could give if, like the Boswal, boys, they settle at home and systematically engage in some special line of agricultural industry.

Geo. L. Boswall's Prize Winning Shropshires at the leading 1912 Fall Fairs

Winner of the Canadian Bank of Commerce Gold Medal Special Prize for the best ram, any breed, at the 1912 St. John Exhibition. Owned and exhibited by Albert Boswall Jr., French Fort, P. E. I.

Albert Boswall's Leicesters, Prize Winners at the Leading 1912 Fall Shows

Progressive Dairy Farming and Stock Raising

An Example of Energy and Progressiveness on McIntyre Bros. Spring Brook Farm

SPRING Brook Farm, McIntyre Bros'. steading and the home of the largest herd of pure bred Ayrshires in the Maritime Provinces is located about three miles from Sussex, the birthplace and home of The Maritime Farmer.

The Spring Brook is not only the largest Ayrshire herd in the Maritime Provinces but their show records for many years have so prominently brought them before the public, that strangers who come to Sussex inquire about the herd as one of the many attractions in the vicinity of the town and almost invariably arrange to see the herd in home quarters.

It is useless to say that visitors are always heartily welcomed at the McIntyre homestead, and a visit to the stables is a source of revelation, instruction and delight to the visitor.

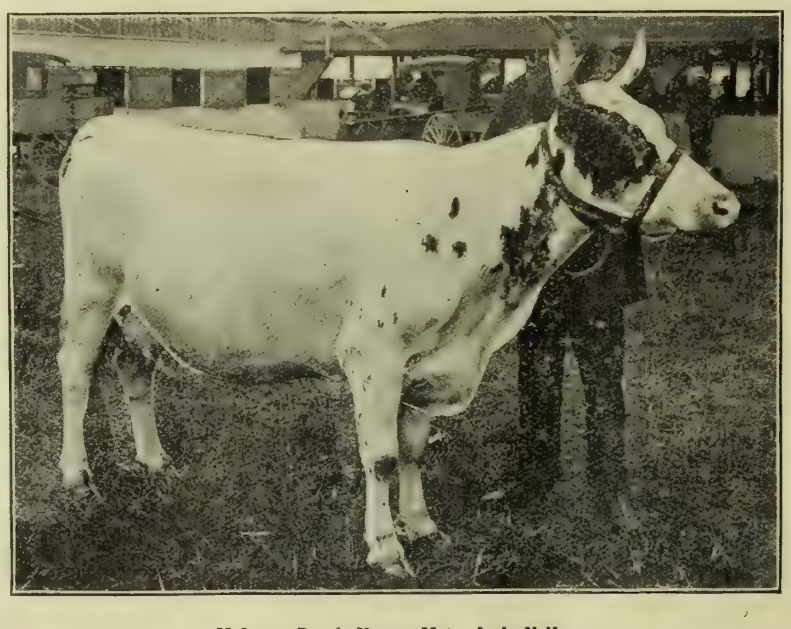
Spring Brook Farm comprises about 600 acres of which 300 acres are cleared and cultivated. The balance is woodland. The soil is a clay loam and is no better than the average soil in the locality only as its fertility has been conserved by judicious farming.

McIntyre Bros. follow a general plan of rotation, which is not, however, inflexible as they change it some-what to suit conditions of soil and season peculiarities. As much plowing as possible is done during the summer and fall, a portion of which is manured and planted with roots and corn, while the remainder is devoted to the growing of oats or buckwheat. The land intended for the hoed crops is manured in the fall and after it is plowed it is harrowed smoothly, in which condition it remains throughout the winter. In the spring it is disced up thoroughly for the planted crop. Sometimes the hoed crops follow oats, and good results are experienced by following both methods. After the hoed crops, wheat or oats is sown and the land seeded. The seeded hay fields are left down for two years, sometimes longer, in case there is a particularly good stand after which they are pastured for a year before repeating the rotation.

The farm is largely upland, though there is a moderate proportion of intervale. About half the land is usually devoted to hay and the other half to grain and hoe-crops. The average yield of turnips per acre is from 1000 to 1250 bushels. A considerable quantity of corn is grown and ensilaged and is fed alternately with the turnips during the winter and spring months. While the season is usually short and the crop gets nipped with frost in some years, McIntyre Bros. persist in growing this succulent crop and find it a great asset in the manufacture of milk and in the maintainance of the herd in a healthy, vigorous condition.

Grange Kelly—30841

Sweepstakes Ayrshire Bull at the St. John and Halifax Exhibitions, also first with three of his get at St. John. Owned and exhibited by McIntyre Bros.



McIntyre Bros'. Norton Mains Lady Nelly

Grand Champion Ayrshire Cow at the 1912 St. John and Halifax Exhibitions.

All the crops produced on the farm are fed in the stables and the necessary supplementary feeds are bought direct in car lots as required.

McIntyre Bros. pay a great deal of attention to the quality of the seeds they sow. They follow a vigorous system of selection with their seeds as they do with their stock and are usually in the list of prize winners at prominent Maritime Seed Fairs. This system of seed selection also stands them in good stead in the Annual Field Crops Growing Competition. In the 1912 competition open to any farmer in the County of Kings, they were successful in carrying off the highest awards in wheat, oats and turnips. This triumph was largely due to careful preparation and after-tillage of the soil well fertilized and the use of selected seed.

A few years ago they won the $100 in gold offered by the Bug Death Chemical Co. for the best six barrels of potatoes, a cut of which is depicted in this issue.

As the name Spring Brook implies every section of the farm is well watered by sparkling springs, very essentail and valuable features on a large stock farm.

McIntyre Bros. cut about 200 tons of hay and grow about 1200 bushels of grain—oats, wheat and buckwheat. They also grow about 60 tons ensilage corn and upwards of 5000 bushels of turnips, a fair quantity of potatoes and in their garden the various vegetables that make for a well supplied farmer's table. A small orchard is also well looked after where a sufficient quantity of apples and small fruits are grown for home use.

The Spring Brook Farm Ayrshires number nearly one hundred head of the strongest type and have, as already stated, been prominent prize winners in the various Maritime show rings for a number of years.

The herd is at present headed by the imported bull, Grange Kelly, grand champion of 1912 at the St. John and Halifax exhibitions. The 1912 Halifax and St. John grand champion female of the Ayrshire class, Morton Main's Lady Nellie, imported from Scotland, was shown in the Spring Brook herd. The first prize on senior and on breeders' junior herds, as well as the coveted diplomas for cow and two of her offspring and bull and three of his get was captured by McIntyre Bros.

The most coveted and, therefore, most valued prize offered in the dairy

McIntyre Bros'. Homestead, Spring Brook Farm, Sussex, N. B.

McIntyre Bros'. Ayrshires

Winners of the Gold Watch special prize for best herd of nine, all breeds competing at the 1912 Halifax Exhibition. In 1911 the special prize given in this section was a silver tes service which also went to the McIntyre herd.

classes at our Maritime exhibitions is the Sweepstakes trophy, offered by M. S. Brown & Co., Halifax, N. S. for the best herd of nine individuals including one bull and eight females—2 aged cows, 2 three-year-olds, 2 two-year-olds and 2 yearlings—Ayrshires, Holsteins, Jerseys and Guernseys competing. This trophy represented in 1911 by a silver tea service and in 1912 by a gold watch was captured on both occasions, in strong competition, by McIntyre Bros'. Ayrshires.

As might be expected the closest regularity is observed in feeding and milking. Five A. M. and four P. M. are the milking hours, which are as closely adhered to as possible. After the morning milking, comes a feed of clover hay. Then after breakfast a feed of pulped roots and mill feeds—crushed oats, which are grown on the farm, bran, middlings and oil cake—is given in quantities varying according to the requirements of the various individuals in the herd.

On fine days the herd is turned out into the yard where there is a large watering trough to drink, exercise a little and expand their lungs with fresh air, after which they are returned to the clean and comfortable stables where they rest in peace and quietness on beds of straw, making milk to their utmost capacity until Charlie comes around about three o'clock in the afternoon when they are watered from a continuous trough in their mangers after which they are dealt their evening ration of roots and grain. After the evening milking which is completed about five o'clock they get all the clover hay they can eat up clean and then about six o'clock, the chores having been all completed, the stables are closed for the night and are left as undisturbed as possible.

A windmill saves a great deal of work in pumping water and slicing roots. A pipe extends under ground three hundred and seventy-five feet to a spring from whence a supply is pumped to a tank in the barn from which it is conducted through pipes to the house and to the manger troughs in the various stables.

The farm has come from father to sons. Mr. McIntyre, the father, manufactured butter at home first and then established a milk trade in St. John. Later this was stopped and the milk was sold to the cheese factory. Some fifteen years ago the sons again began selling milk in St. John and are steadily prosecuting the business. The present milking herd numbers 45, all told, the balance of the herd being young stock and cows nearing the freshening stage. The cattle freshen at all seasons but as many of them as possible are bred to milk during the winter months. It is planned to give the cows a holiday of nearly two months between milking periods. The owners believe that such a rest enables the cow to milk better and last longer than when she is milked right up to the point of calving. A good deal of difficulty is experienced in drying them off at times, and it is of little wonder seeing how they are fed and cared for. The cows appreciate their daily grooming and when it comes to the milk pail they excel themselves.

We can remember when the Spring Brook herd consisted mainly of Ayrshire grades headed for a long number of years by pure bred males of the same breed. As years went on an occasional purebred female was added to the herd. The natural increase and the further purchase of imported and Canadian bred males and females went on until the grades are now in the minority and pure breds constitute the majority, the quality of which can receive no higher testimony from us than that awarded them at the various exhibitions already mentioned in this sketch.

E. O. McIntyre **H. H. McIntyre**

And McIntyre Bros. Prize Winning Six Barrels of Potatoes. Winners of the Bug Death Chemical Company's $100.00 in Gold.

Animals from the Spring Brook herd have been sold in all parts of Canada and some in the United States. They have given universal satisfaction and not a few of them have won laurels at Toronto and other pretentious exhibitions. A great many bull calves, bulls ready for service, heifer calves and cows and heifers bred or ready to breed are annually sold at reasonable prices quality considered.

A nice flock of Barred Plymouth Rocks, of good laying strain, are kept on the Spring Brook Farm.

The Spring Brook horses number about nine—two teams for farm work and the remainder brood mares raising foals for work on the farm and general use. The sale of an occasional colt adds to the revenue of the farm.

McIntyre Bros. are five in number and each and every one of them is full of faith in their work.

Will is not directly connected with the farm work as he is engaged in commercial interests in another part of the Province.

George, who represents manufacturing interests, takes a deep interest in everything about the farm and is conversant with every detail.

Edward O. has the general supervision of the farming operations such as growing and harvesting the crops and thus represents the producer.

Charles L. has charge of the stables and herds and manufactures the raw products into milk. There is not a more careful feeder or stock man in Canada. He represents the manufacturer.

Harry H. represents commercial interests by marketing the finished produce.

For a harmonious working combination of business like farmers it would be difficult to find another like the McIntyre Bros. They are business like in their dealings both at home and abroad. A general neatness and order prevail in their every day line of work. They work as one man and stick to it. Therein lies the inspitation for others, as their stock is an ideal to which other industrious young men may attain. Each for all and all for each is a good brotherly motto.

First in their class at the 1912 Halifax and St. John, Exhibitions.

Care, Feeding and Management of a Flock of Sheep

Preparing Wool For Market

By Jas. A. Telfer, Dominion Sheep Expert for the Maritime Provinces.

WHY do not the farmers of the Maritime Provinces raise more and better sheep? Nowhere in Canada has the farmer greater opportunities for sheep rearing than in the Maritime Provinces. Here we have combination of soil and climate, which under ordinary circumstances and a fair share of attention to proper cultural methods, will yield the very qest quality of swede turnips, hay and oats' the three most essential crops for sheep feeding.

It should also be the aim of farmers in the Maritime Provinces as well as elsewhere to rotate his crops and keep a class of live stock that will maintain and increase the fertility of their farms, that will again bring into fruitful bearing at the least possible expense, farms that may perchance be infested with weeds and run down through bad systems of farming.

With this end in view, and possibly that of lifting a mortgage or increasing his bank account, the aver. age farmer can make no mistake by establishing a nice flock of ewes or adding a few more to those which he already has in his possession.

The one great and most serious drawback to sheep raising is the dog nuisance; but this surely cannot be a strong objection for dogs are no more difficult to control, or to kill, here in the Maritime Provinces than they are in other countries, where sheep are successfully raised.

I find that good dog-laws are on the statutes of our provinces and it should be the duty of our farmers to see that these laws are strictly enced.

With the steady inctease of population and the constantly expanding home market, as well as the markets of Western Canada, to which we annually ship many carloads of mutton and lamb, our markets of the middle West, Montreal and Toronto and the great British market ever within easy access, our farmers have at their disposal the very best markets in the world. All that is lacking to cater to the offered trade is a greater number of well-bred and well fed lambs placed on the market in a finished condition and not in the unfinished state in which they are now too commonly se?n.

The most important item to a beginner in sheep-husbandry is the foundation flock. Let us for a moment study the nature or condition of the beginner's farm with a view to selecting a breed of sheep best adapted to his particular conditions of soil and climate. If the land be high or hilly and the flocks would have to roam over an extensive territory in order to secure a living, I would strongly recommend some breed of hill sheep.

Hill sheep are more active and hardy and do not require so much extra care aad feed as do the heavier breeds, which in order to do their best, should be reared on well cultivated land, where rape or some such succulent feed may be grown and on which they may be folded when it is found necessary to supplement the pasturage.

Having selected the flock or ram of breed deemed most suitable to ones surroundings the next most important step is

THE CARE AND MANAGEMEET OF THE FLOCK.

The shepherd must start in the early fall and prepare to put his flock through the winter in the best possible form. To do so it is necessary that all the lambs be weaned not later than the first of September. When this is done he must see that he has in readiness a fine patch of rape or turnips, where he can turn his lambs after weaning for a few hours each day. It will not do to keep the lambs on the rape all the time as they like change or a variety of food.

He must not neglect the ewe flock but must try and have a new pasture ready for them after they have weaned their lambs so that they may flesh up and be in good form for the breeding season that the lambs may come fine and strong.

Not later than October 15th, the sheep owner must make sure that his flock is free from vermin, ticks and lice, and the only sure way will be to have them properly dipped in some good poisonous dip. Dipping not only rids the sheep of vermin but it also promotes the growth of wool. Dipping also make a great saving in the feed bill as a sheep infested with ticks or lice is always hungry and is never in a good healthy condition.

HOUSING THE FLOCK.

The winter house or shelter for sheep need not be very expensive, where early lambs are not expected; but three things are very essential—freedom from draughts, a dry location and plenty of light. Sheep will not do well in a wet pen or yard and furthermore, there is grave danger of developing foot-rot in such quarters.

The feeding racks should be so constructed that the best possible amount of foreign matter will get in the wool, for the fleeces, in order to bring the highest prices must be kept clean. In feeding be careful that any hay or litter does not fall on their backs.

After the breeding season is over take the ram gway from the ewe flock and keep him in a nice roomy, pen by himself, where he can get plenty of excercise. ...

It will be found that this is a safe plan to follow for rams sometimes become somewhat cross and at feeding time will want a great deal of their own way and if they do not get it they draw back and strike and not infrequently in-lamb ewes are injured to the extent of causing abortion or a dead lamb at birth.

The in-lamb ewes should have plenty of exercise throughout the winter season. If the weather is stormy the sheep should not be exposed to it but when fine weather prevails carry out a bundle of hay to some distance from the sheds and make them travel out for it.

In winter feeding do not feed the turnips first thing in the morning as they are too cold but rather feed them the hay first. In any case do not feed pregnant ewes with roots. About a month before lambing time feed a little grain once a day. Keep salt and water always within their easy reach.

As soon as the lambs are from seven days to two weeks old the grade males should be castrated and both males and females should be docked.

Now we are approaching shearing time and a few words regarding the proper handling of the fleece may not be amiss. Wool in the Maritime Provinces is being marketed, as is well known, in a very deplorable condition and in order that we may in future take our proper place and compete with wool from other countries, we must give greater attention to the care and handling of the fleeces.

The proper handling of wool may be done with a great deal less labor than the tub-washing method which is the practice of the present time. The tub-washing system should have been dispenced with years ago, as tub washed wool is not wanted on the European markets. In order to compete successfully for the best markets our wool must be put up in proper form. This is a simple matter. When clipping the sheep be very careful that the fleece does not become broken so that when the shearing is completed the fleece may be rolled properly. To fold a fleece properly lay it on a clean place with the clipped side down, clip away all tags and then turn in the sides to the centre and then starting at breach end roll up firmly until the shoulder is reached when the neck wool is twisted to form a band around the rolled fleece. The firm of the band is slipped under another portion of the band and then the fleece is ready to pack for market.

Some readers may say "there is more money in selling our wool, tub-washed." Let us for a moment consider this question. Tub-washed wool will shrink from 40 to 60 per cent. so we are told by wool experts and if this fact be true and I believe it is, let us take examples of selling tub-washed and unwashed wool at prices, which were general in the Maritime Provinces last year. ...

A certain fleece weighs 10 pounds and for easy figuring we will say the unwashed price is 15 cents per pound or a gross receipt for the fleece of $1.50.

If the wool is tub-washed and as already stated it looses 50 per cent. in weight we would only have 5 pounds of washed wool from the ten pounds fleece which ordinarily sells at about 22 cents per pound and nets the seller for the whole fleece the sum of $1.10.

This is forty cents less than what the unwashed fleece would have brought and the farmer had the additional trouble of washing the fleece. It seems to me that the farmer who tubwashes his wool comes out on the wrong side of the ledger and I trust this illustration will at least make some one take notice and try the better and simpler method. I would like to dwell longer on the question of preparing wool for market, but I do not wish to take up too much of your valuable space. I trust the few ideas I have set forth may be the means of encouraging some farmers found new stocks or increase their present flocks and that their proper feeding and care may not be neglected but become one of the farmers' chief studies.

Burder Goodwin's prize winning Oxford Downs at the leading 1912 Fall fairs

Great is the Power of Example of Faith in One's Farm

Intensified Farming Exemplified on Dicksie Land Farm, Truro, N. S.

DICKSIE Land Farm at Board Landing Bridge, near Truro, N. S., is not only the home of one of the most promising herds of Guernseys in the Maritime Provinces, but also the home of Mr. Hugh A. Dickson, one of our most enthusiastic and successful young farmers.

Mr. Dickson comes from a family of successful farmers. His father and grand father were pioneers in underdraining and clover-growing in their district. Long before the advent of the Agricultural College they had their farms underdrained with a thorough system, which reached every square

Hugh A. Dickson

Proprietor Dicksie Land Farm, Truro, N. S.

rod of their uplands, at a cost of $50.00 per acre. Mr. Dickson says that he has often heard his father tell of some of their first lessons on the real value of underdrainage, gleaned by observing the results of their own experiments.

Mr. Dickson is a young farmer who is full of faith and enthusiasm in the highest calling open to man. He is full of faith in the future of his province and of the opportunities which it presents. He is full of faith in his farm and the Guernsey cow.

Most people would call such faith as Mr. Dickson evidences a spirit of optimism. Call it what you will. He's got it.

When Mr. Dickson was fifteen years of age his father died, and as he was the oldest boy he left school, which he had been regularly attending up to that time, and ever since he has been carrying on farming operations, largely under the guidance of his mother for the first few years.

At the age of nineteen or twenty, partly under the spur of having a very productive farm and partly the ambition to do things right he began to branch out and soon worked into a very intensive system of farming, raising ten to twelve thousand bushels of vegetables yearly, keeping about thirty-five milch cows and retailing the milk in the neighboring town of Truro. He carried on the retail milk business for the five years previous to the first of last January, when he sold the milk route. He now wholesales the milk to the man who bought his route. The retail trade was somewhat the more profitable but there was so much more detail to look after in connection with accounts, collecting, etc., and as he had to depend on hired help to deliver it he decided to sell the route.

The breeding of pure bred stock and exhibiting at the exhibitions and fairs made it harder to watch the details of all departments.

Dicksie Land Farm comprises 129 acres under cultivation, 45 of which is marsh land. The marsh is all high and dry and produces the best quality of English hay and a splendid crop of after grass on which the herd thrives for three or four weeks every fall.

The marsh has all been turned over during the last six years, a crop of grain has been grown on every part of it and it has been reseeded with timothy and clover, and fertilized by the application of 7 or 8 cwt. of basic slag per acre. The result is that this year it produced an average crop of nearly three tons of hay to the acre.

Mr. Dickson and his father before him have always followed a systematic rotation of crops on their uplands. The rotation has been: roots, grain, clover hay and pasture, sometimes varied a little by taking two crops of roots off the same land such as small vegetables following potato crop or allowing it to go two years in pasture.

Mr. Dickson finds two years of incessive pasturing will kill any couch grass which may have gotten into the land. This year the returns from the Dicksie Land Farm garden vegetables amount to about $1800.00, F. O. B. besides the large quantities of mangels, turnips, etc. used for feeding purposes. The sales of vegetables are as follows:

Turnips	$550.00
Parsnips	400.00
Carrots	175.00
Cabbage	300.00
Potatoes	160.00
Garden Truck	200.00
Total	1785.00

The Dicksie Land vegetables find a ready market in Truro and they hold it on their merit and they prove to be one of the farmer's main sources of revenue.

We hear a great deal now-a-days about farmers raising their own feed instead of sending so much money out of the country for mill feeds. Mr. Dickson's contention is that this is all right in sections of the Maritime Provinces where it is impossible to market very much farm produce and where land is cheap; but in sections of the country where land is worth from $100.00 to $300.00 per acre he considers a man would be foolish to raise, say fifty bushels of fifty cent oats to the acre, netting him perhaps $25.00 per acre when he could net from $100.00 to $200.00 per acre by growing vegetables.

Grain growing on Dicksie Land Farm is used as a means to an end viz:—for the purpose of seeding down.

Mr. Dickson says "Let the West raise our mill feeds where land is worth but $20.00 per acre. For my part I prefer to follow an intensive system of farming on high priced land."

If a man can grow strawberries on his farm cheaper than he can grow grain, let him sell strawberries at $600.00 per acre and buy his mill feed.

Mr. Dickson also considers that the use of hoed crops in the rotation is the only sure way of keeping the farm clean, while grain growing is especially conducive to the seeding of noxious weeds and consequently weedy farms result.

As all grain grown on Dicksie Land Farm is fed on the farm, Mr. Dickson prefers to grow mixed grains as they give a larger yield per acre and stand up much better thus allowing the clover to make a better start.

His seeding mixture consists of 10 pounds of common red clover, 2 pounds alsike and 8 pounds timothy. He finds the common red clover is much more preferable than the mammoth red as the stalks are not so coarse and the common red produces an aftermath while the mammoth red does not.

Mr. Dickson has been experimenting with alfalfa and we would judge that he is on the high road to success in the undertaking. He has one and one-quarter acres, started in 1911, without inoculation, from which four and one-half tons of hay were harvested in 1912, from two cuttings and there is a strong growth left for winter covering.

The Dicksie Land herds consist of 35 milch cows and a number of young stock, which is turned to hay field pastures (as there are no rough pastures on the farm) about the first of June.

The farm rotation is so planned that sufficient hay fields are let out to pasture to carry three head per acre. As the grass has had a good start before the stock is turned out they get all they want to eat throughout the month of June or longer if good showery weather prevails. As soon as the pastures begin to fail, Mr. Dickson commences the feeding of soiling crops to make up the deficiency. The soiling crops consist of clover or alfalfa first, then a mixture of green oats, peas and vetches which had been sown at different periods so as to be ready for soiling about every two weeks. This green feed carries the stock along until the earliest soft turnips will be ready for feeding—the Greystone and Aberdeen Yellow make excellent crops for summer feeding and are very easily harvested. A man can take a cart into the field and pulling tops and all load up in a very short time. As these turnips have only a very small top-root they are generally perfectly clean and may be fed whole, right in the manger. By the time the soft turnips have been exhausted the first clover aftermath will be ready and it makes an abundance of milk-producing food. After this comes the marsh aftergrass which keeps the cows doing their level best until they are housed in the fall.

Turnip pulling starts on Dicksie Land Farm about the 20th of October and the turnip leaves from six to seven acres yield a great lot of succulent, milk producing food.

In regard to harvesting turnips, Mr. Dickson says "I have never tried the system of harrowing out our turnips after the tops have been cut off with a sharp hoe and raked up as advocated by a writer recently in the columns of the Maritime Farmer, perhaps for the reason that so many of our turnips have to be dressed for market."

He can get his cut and topped ready for market for an average of about $4.50 per acre, which is in the end about as cheap a way as any as the tops and turnips are easily gathered and the turnips go into the cellar free from mud and roots and so keep much better than when they are harvested by the helter skelter system.

One of the Dicksie Land Guernseys

Gipsy of Willow—392—as a two-year-old, has won many first prizes at different ages Highest scoring three-year-old Guernsey cow at the 1912 Maritime Winter Fair.

While a great many authorities object strongly to the feeding of turnips and leaves to the milch cows, Mr. Dickson finds that when they are fed at the proper time—immediately after milking the milk will not be tainted.

During the winter season the cows get all the clover hay they will eat up clean. Sliced roots—turnips in the morning and mangels in the afternoon—at the rate of about twenty pounds per cow are fed twice daily. Meals of various kinds are sprinkled over the turnips at the rate of from 3 to 8 pounds per cow, according to the amount of milk produced by the individual animal. The cows are given a small handful of salt every day and are turned out to water as there are no basins in the barn although the water is supplied from a well by a windmill pump.

The Dicksie Land stables are well ventilated and are kept scrupulously clean. The main herd consists of grade cows of all breeds which have been largely bought up around the country. Mr. Dickson considers that any cow, of any breed, which gives indications of a good milk flow of good quality answers the dairyman's

Drilling and sowing the turnip rows. Corner of a fifteen acre field of vegetables on Dicksie Land Farm, Truro, N. S.

Hoeing parsnips between showers in haying time on Dicksie Land Farm, Truro, N. S

A Portion of the aged Holstein Cow Class at the 1912 Halifax Exhibition

purposes very well. He has found that there are good cows in all breeds but he has a special preference for Guernseys and his reasons are:—

1. Their quiet, gentle disposition as Mr Dickson puts it "A man needs to have handled them in order to appreciate these traits". It is seldom that one finds a cross Guernsey bull and the cows and calves are so quiet and kind that they do not seem to have no fear of man.

2. Guernseys all have nice teats and are easily milked. Small teated or hard milking Guernseys are very rare.

3. Guernseys give a large flow of highly colored milk. Guernsey milk is famed for its natural color. When a bottle of Guernsey milk is allowed to set for a while the rich color is found from the top through to the bottom.

4. He believes that Guernseys excell as economical producers as many of their public tests have proved that they produce milk and butter fat much cheaper than any other breed. The main drawback to the breed, Mr. Dickson considers, is its lack of uniformity. This weak point is, however, being rapidly overcome and true to type individuals also hold high producing records.

THE DICKSIE LAND GUERNSEYS.

Mr. Dickson made his first start in the breeding of pure-bred Guernseys about two years ago by purchasing the bull calf, "Conqueror of Willow" from Roper Bros., Charlottetown. This typical young bull's dam was Dolly of the Villet, an Island of Guernsey bred cow, that has for over half a dozen years carried off the female sweepstakes at our exhibitions and which is also a good producer. "Conqueror of Willow" has developed into a very deep, strong bodied bull, of ideal markings, and a sure stock getter.

A year ago, Mr. Dickson made his first purchase of pure-bred females by purchasing a two-year-old and a three year-old in calf from Roper Bros., for which he paid $200.00 each. Mr. Dickson says that at first he thought this a big price for a cow but after he had the heifers in his barn a few months he decided that they were not expensive at all and he is well pleased with his bargain.

The heifers dropped two splendid heifer calves and in 1911 made good records at the Maritime Winter Fair, being third from the highest in total points and first in butter fat. Mr. Dickson considers that the first crop of calves were worth half the cost price of the cows so that in reality they did not cost him much more than he would have had to pay for good grade cows.

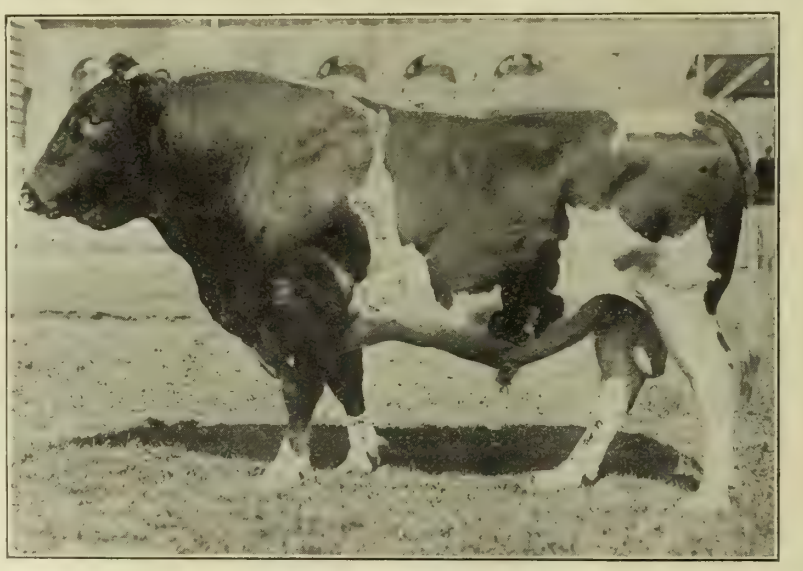
This fall, Mr. Dickson increased his herd of pure-breds by the purchase of three heifers and their calves, each one of them being a splendid individual with good breeding behind them. One of the heifers is out of Jennie's May, the cow which came within an ace of capturing the cup at Amherst in 1911.

While attending the Nova Scotia Farmers' Association at Yarmouth last winter, Mr. Dickson purchased from H. W. Corning, M. P. P. a Dairymaid of Hillside heifer. It will be remembered that Dairymaid of Hillside made an official record as a two-year-old, of 530 pounds butter in one year. Her bull calf was sold last winter, when but a few hours old for the sum of $150.00 to head the Guernsey herd on the Dominion Experimental Farm, Ottawa.

Mr. Dickson believes that the reason why more young men do not purchase pure-bred stock is the seeming high prices, but his own experience has gone to show that once a person gets properly started matters begin to come his way. If a person gets value for his money, the higher prices paid the higher prices he can get for his stock providing he is a breeder of stock for which there is an active demand.

Sir Mercena Faforit Lad

Champion Holstein Bull at Fredericton in 1911, and first with three of his get at St. John and Halifax 1912 exhibitions. Owned by Harding Bros.



Schuling Sir Posch---3707

Grand Champion Holstein Bull at Toronto in 1909 and 1910. Now head of Harding Bros., Wish-Ton-Wish herd, Welsford, N. B.

Mr. Dickson sees a bright future for the Guernsey breed as well as for the farmers who will engage in the breeding.

There are at present six cows and heifers in the Dicksie Land Guernsey herd that cost $200.00 each and although these prices are low compared with some of the prices realized by some of the United States breeders Mr. Dickson claims that he knows of no better investment for a sum equal to the total price of the six cows than the purchase of a bull with high producing and constitutionally strong ancestry. The calves from a bull of this kind would easily be worth $100. more than the calves from a cheaper bull. The secret of the whole transaction being that farmers are commencing to see the benefit of breeding to high producing stock and are willing to pay the price.

All the work on Dicksie Land Farm is done by hired help and no difficulty is experienced in retaining the men. There is a cottage on the farm for a married man. There is work for two men the year round and an extra man who lumbers during the winter season is hired during the summer.

Mr. Dickson believes that a good horseman does not want to tend cows and a good cowman does not want to tend horses so each man on the farm has his own particular work to attend to and consequently everything goes along decently and in order.

Mr. Dickson considers that the chief essentials for successful dairying are: Sufficient quantities of food to keep the cows full at all times. The keeping of good cows that will give a handsome profit on the feed they consume. Have a cottage for the hired help and hire him by the year. Feed lots of short feed on the farm and in this way increase the fertility of the soil rather than by the purchase of commercial fertilizers. Have a large hoed crop in the rotation, either for feed or for the market, raising the crop which is the most profitable and with the proceeds, purchase concentrated feeds to return the fertility to the soil. Keep a strict record of the performance of the individual cows in the herd and keep a bull of the very best producing strain.

Although Mr. Dickson is a busy, practical young man who is doing exceptionally well on his farm he realizes that he can very materially advance his own interests by taking advantage of the opportunities for acquiring an agricultural education such as is offered by the Nova Scotia Agricultural College, which is within driving distance from his farm. He attended the regular courses at the college last year and this year he will complete the second year's work.

We know of no better type of citizen in the Maritime Provinces than that which is exemplified by Mr. Hugh A. Dickson. His example in promoting intensive farming should stimulate many more of our young men to put forth practical efforts for the upbuilding of their home farms.

Diversified Farming on a N. S. Fruit Belt Farm

Father and Sons Exemplify the Strength of Unity

AT Windsor Forks, about five miles from the town of Windsor, N. S., on the banks of the Aron, is located the farm of Wm. O'Brien & Sons. The firm name, Wm. O'Brien & Sons is not new to our readers, as for many years they have been taking a leading part in the agricultural development of the Province of Nova Scotia and their horses and cattle are always high up in the list of prize winners at our leading exhibitions.

Mr. Wm. O'Brien was born of Irish and Scotch parentage on a farm near Windsor and about twenty years ago he purchased the farm which he now occupies. At that time the farm was well known to be very much run down in fertility by bad systems or non systems of farming and it was practically without buildings of any kind. By untiring efforts and careful management Mr. O'Brien and his sons have built up from a regular chaos what is today considered to be one of the best farms in Nova Scotia.

A firm believer in the fruit growing possibilities of his district, Mr. O'Brien at the very beginning of his farming career at Windsor Forks set out a number of apple trees. He has been steadily increasing the number year by year until he now has upwards of twenty-five acres under orchard containing the leading export varieties.

The O'Briens ship their fruit by the carload on consignment to some of the leading fruit dealers in Great Britain. They grow good fruit by following modern methods of cultivation and spraying. They are careful to pack their fruit in such a way that they seldom or never receive a complaint and, consequently, they are not afraid to let the consumer know who grew the fruit by means of stencilling their name and address on each barrel. A clean, honest pack brings its reward from foreign as well as from home markets, in the way of repeat orders and fifteen years of regular dealing with the same customers.

The O'Briens plan to grow hoed crops in their young orchards for the first four or five years, and vetches constitute the main cover crop.

Realizing the importance of following a system of mixed farming Messrs. O'Brien have from the beginning of their farming career paid a great deal of attention to the raising of live stock. A fine stud of pure-bred Clydesdales, a herd of pure-bred Herefords and their grades, a flock of Leicester sheep, and turkeys, ducks and geese of quality all find a place in their system and each class fill their place in augmenting the revenues of the farm.

The keeping of live stock furnishes a large quantity of barnyard manure, which has played a very important part in the upbuilding of the farm and in maintaining the fruitfulness of the orchard.

The meadows on the O'Brien farms are second to none in the Maritime Provinces, and on them large quantities of hay are raised every year.

One of Wm. O'Brien & Sons' Farm Teams

A Bunch of Grade Hereford Steers and Heifers at Pasture

Scene on Wm. O'Brien & Sons' Farm, Windsor Forks, N. S.

Feeding the Pullets

Being particularly interested in beef raising Messrs. O'Brien have made the Herefords their chosen breed as they mature early and are economic producers of excellent beef. They find that it is not necessary to purchase large quantities of expensive mill feed but raise all the hay, mixed grain and roots on their own farm. They find that in order to be successful in the beef raising business under Maritime Province conditions that the chief essential is large growthy cows, that weigh from ten to thirteen hundred pounds, not of the extreme beef type because the cows must produce enough milk to feed their calves and also give a good return in the shape of butter. Such cows mated to a Hereford bull produce short-legged calves with good loins and backs.

The O'Briens plan to feed their cows as follows: All the hay they will eat up clean three times per day; half a bushel of turnips divided into two feeds and four quarts of mixed feed. By this system of feeding the cows give a liberal supply of milk, sufficient to keep the calf growing and some to spare for butter making.

The calves are dropped in the fall or early winter and are allowed to nurse, to suckle their dams until they are about three weeks old, when they are taken from the cow and as soon as they learn to drink skim milk, and a little flaxseed jelly gradually takes the place of the whole milk. Should a calf show a tendency to scour then add a little wheat flour to his diet. Within easy reach of the calves is a box containing a few whole oats and also some light clover hay. The O'Briens follow this system of feeding until the calves are about five or six months old, and to evade the torture of heat and flies they are kept in the barn during the summer.

The males are castrated as soon as they are sufficiently developed. The calves are dehorned as soon as the embryo horn can be felt under the skin, by clipping the hair and applying caustic potash. Dehorning makes the calves quieter among themselves when loose in box stalls where they are usually kept until they are about eighteen months old.

During the second winter the steers are fed on rough hay and straw, supplemented by pulped turnips and sufficient grain to keep them thriving.

When it is deemed advisable to market the steers at twenty months of age they have good pasture until such times as they are sold, or if it is intended to carry them over another winter they go on rough pasture during the summer and have a run on the aftergrass in the autumn and are thus put in good condition to finish off during the next winter. The O'Briens pay particular attention to the comfort of their steers. They keep them well bedded to induce them to lie down as they believe they make their best gains when comfortaby, reposing.

The results accomplished by the O'Briens in beef raising have been most gratifying. The beeves are sold in the Halifax market where a fraction over the highest current prices are readily procured for a well finished article.

Mr. O'Brien always thought that a farm was not complete without a flock of sheep and, consequently, the farm boasts a flock of about twenty-five pure-bred Leicester breeding ewes. The sheep are a valuable asset on the O'Brien farm. They keep down the weeds and turn a great deal of roughage into available cash. They have particularly good success with their lambs, some of which are sold for breeders. The wool goes to the harvest cloth mills, and on the whole Messrs. O'Brien reap a handsome profit from their flock.

CLYDESDALES.

With the necessity for heavy farm machinery came the demand for heavy horses. To cater to this demand the O'Briens started breeding Clydesdales over fifteen years ago and have persisted in the good work unno fewer than twelve pure-bred mares til their stables, at present, contain and the three stallions—Norseman, Petruchio's Heir and a two-year-old. The latter is a horse of great promise, light footed and true gaited. The mares include; Lady Flashwood, Kate Claxton, Peggy Primrose Francis, Jennie Windsor, Nelly Flashwood and a number of youngsters.

The first pair of pure-bred Clyde mares owned by the College Farm, Truro, Duchess of Fife and Belle of Avon were purchased by Mr. F. L. Fuller from the O'Briens. The mares in question raised a lot of stallion colts that sold all over the Maritime Provinces and were conducive of improving the draft horse quality very materially.

One stallion sold by the O'Briens is at present doing stud purposes on an Alberta ranch.

It pays to keep a good draft team as, with their use and that of improved farm machinery the heavier farming operations and trucking to and from town may be done in less time and cheaper than when a lighter class of horses is employed.

Mr. Wm. O'Brien's ideas on "horses for the farmer and how to breed and raise them" was published in Prof. Cumming's report on agriculture a year or two ago, for the benefit of our readers we reproduce them in another page of this issue.

Picking Raspberries

On Wm. O'Brien & Sons' farm, Windsor Forks, N. S.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

YOU ARE LOSING MONEY

THERE are two classes of stock breeders in the Maritime Provinces—those who advertise their stock and those who do not. The former class lets the world know what they have to offer and consequently are making good sales which rid their herds of surplus stock. These stock breeders keep their wares constantly before the public and not infrequently some of their young stock is placed before they see the light of day. A visitor to their stables will not be met with a tale of woe. "I have sold every hoof with which I dare part," is the story they tell. You do not find any where from one to twenty young bulls, as is commonly remarked, "eating their heads off."

Stock men of the other class do not advertise or if they do, their efforts along this line are very transitory. A visit to their stables will find that they have all kinds of young stock for sale but none of it seems to be moving—the persons who would buy such stock do not know that such a herd or flock exists.

We venture to say that the man who spends a fair amount in advertising and keeps before the public, raises his stock to a marketable stage better and cheaper than the man who seldom or never advertises. If we were going to buy young stock, or any stock for that matter, we would patronize the breeder who advertises regularly for our observation has been that he who advertises has fewer stunted, ill cared for stock to offer. His herds are kept down to a minimum and consequently there is an abundance of feed and comfortable quarters, coupled with good care for the stock.

Across the way we find the reverse, the herd or flock has increased in such numbers that it is almost impossible for the breeder to give his stock the room, feed and attention they require and as a consequence stunted animals may be seen at every hand.

A stunted animal is a poor buy at any price and the discerning buyer will shun it.

While canvassing some breeders for advertising early last summer, we met with the remark in several cases, "I do not need to advertise as I can get all the publicity I require from your published list of prize winners at the Maritime Winter Fair and Provincial Exhibitions." This set us a-thinking that we were losing money by following the practices of giving addresses of prize winners at the various Maritime exhibitions. This fall we decided not to publish any addresses and the result has been most surprising to us. Almost every mail we receive an inquiry for the address of such and such a breeder. We have not yet received an inquiry re the address of any of our advertisers Mr. So or So won such and such a prize at such and such exhibitions. Interested readers look over our columns and if he advertises there they find his address. If he does not advertise with us they aks us for his address. We will not furnish addresses of breeders who do not advertise in our columns.

If a breeder wishes the public to know his address, through the columns of the Maritime Farmer the very least he can do is to place his name in the Breeders'Directory which will cost him only $1.00 per line per year.

Our display ad. rates are also exceedingly low to breeders.

The Maritime Farmer's policy has always been to help the breeders and farmers. We look for reciprocity in this matter for by helping us by giving us increased patronage the breeder is thus helping himself to make sales that might otherwise pass him by.

CO-OPERATION

THE Farmers' Dairy & Produce Co. Limited, which was organized to operate in St. John in July last, has been making considerable progress.They started with some sixty members, composed principally of farmers along the line of the I. C. R. from Penobsquis to Jubilee. Each member took one share in the Company, consisting of $100. Everyone started in the same position, so far as their interest is concerned, that is, one party can only hold one share of stock.

This was used for organization purposes, and for purchasing the outfit and plant, to enable them to open business, which they did on July 1st, at 680 Main St., in the city of St. John. Here they established a butter plant and an office, for the sale of farm products, principally composed of milk, cream and dairy products. At the start, they purchased the business and good will of Thos. Robinson, who had been running a milk route in the city, for many years. This enabled them to make a start, from which they have gradually grown to the present business, which amounts to nearly three times what they started with in July.

Since that, the Company has also grown to include at the present time, nearly seventy-five members, and as their charter enables them to extend this to ninety-nine in all, it leaves room for a few more good dairymen to secure a share of this stock. The Company now have a full equipment for making butter, as well as handling fresh milk and fresh cream, and as they are also able to reach a sale for the bye-products, in the way of buttermilk and skim milk, it enables them to have an income from this source, which is not always possible at some of the creameries operating at the country points.

This has enabled the Company to pay a higher rate for their butter fat among its butter patrons, than is possible under almost any other method.

Besides handling the dairy products, the Company are in a position to assist their patrons in the sale of almost any other products that they may have, in the way of produce of all kinds. In fact, they have already made shipments of potatoes to the West Indian and Cuban markets, on behalf of their patrons, and as they have a floor space of 60x62 in a frost proof warehouse, they are also able to carry potatoes and other produce at this point, available for shipment after the winter closes in, and prevents shipping from outside points.

The Company is a regularly organized Joint Stock Company, under the New Brunswick Joint Stock Company Act, and yet is co-operative as well, the method being, to keep account of the returns from each and every product throughout the month, and then after deducting the running expenses, to divide the total net return among the different shippers, for the payment of each particular class of goods, so that the farmer can feel assured that he is getting all that the market can afford to pay, and in this way, he can keep on increasing his production at home, feeling satisfied that the products will be sold to the best advantage. The plant is situated in the N. B. Cold Storage building, which is particularly adapted for a business of this kind. They have a cold room, which is connected with their cold storage plant, and which enables all dairy products to be kept in good shape, and it also enables them to use the cold storage plant, when necessary, in the event of a glut in the market of pork or poultry produce, which the company are also handling to a considerable extent.

At the present time, the Company are anxious for all the fresh cream they can possibly get, and are at present, buying from members outside their own company as well, though to those who are members of the Company, there is a little better return, than where they purchase the stock outright but as there is still room for a few more members to join, it would pay almost anyone who is producing any quantity of cream, to get in touch with the Company, while there are still shares available.

In addition to their sale department, the Company are also making some progress in buying feed for the members of their Company, and have already delivered several carloads of mill feeds, at some considerable saving to their members.

Any good dairyman who wishes to ship cream, can secure one share by applying to the Company, who will inspect the stock and stables of the applicant, and if acceptable to the Company's local director at the nearest shipping station, the name is brought before the next meeting of Directors, and action taken.

The organization papers of the Company at present, permits of 99 names, but if the work continues successfully, it is intended to enlarge, and take in all farmers who wish to join, and are prepared to take a little extra pains with their stock, and produce a good article, as it is by this method, the Company hope for a share of the consuming market in St. John, which we are glad to say, is on the increase.

"The best the farm can produce direct from the producer" is the slogan of the Farmers' Dairy & Produce Co., Limited.

THE PLUG

DON'T make fun of the plug. He may be slow and awkward and never get to the stable until dark, but he is the fellow who in the end will bring home the coin, says Bert Walker. The plug horse that pulls the harvester all day in the field puts more money in the bank for the honest farmer than a race horse that goes out and turns a half in 0:50 flat and then loafs for two weeks waiting for another race to be matched. The old plug goes out in sunshine and storm and pulls in a few dollars every week, but the race horse waits for the day when the track is good and then generally loses more than he wins. The steady old plug keeps the wolf from the door, while the race horse causes the mortgage to be foreclosed. Jast so with the man. Pin your faith to the plug who keeps eternally at it; the fellow who gets up every morning and does so much and is ready to do it again next day. He lays up more shining dollars in the bank than the swift sport who lays around all summer waiting for luck to come along and turn a stream of silver into his pocket. One cackling Plymouth Rock hen is worth a dozen screaming eagles when it come to paying off the mortgage. The plug is the fellow who steadies the ship and acts as ballast when the boats begins to rock. The plug is the fellow who lives contentedly and long, and when he passes away the local papers say, "He leaves his family in comfortable circumstances."

CARE OF THE DAIRY COW

THE dairy cow is the hardest worker of all our domestic animals. Every year she gives from five to ten times her weight in milk, containing as much actual dry matter as do the bodies of two or three steers. When we consider that it requires approximately the same amount of energy to produce twenty pounds of milk as it does to plow one acre of land, we get a conception of the enormous amount of work the cow does.

To produce well the cow has to be carefully fed. The animal loss to dairymen and farmers resulting from feeding an insufficient or unsuitable ration is quite large. One common mistake is to neglect the cow late in lactation. The amount of feed at that time cannot be gaged by the milk flow. The cow should be turned dry six or eight weeks before freshening, but just because she is not giving milk is no sign that she does not need food.

A GOOD dairy herd, when properly cared for, produces revenue with which to improve the farm. One of the safest ways to make the farm afford a competence is to supply it with dairy animals. Dairy cows consume the coarse products raised on the farm and transform these into butterfat.

Profitable Dairy Herd Regularly Tested

Keeping Live Stock Increases Soil Fertility.

A FEW weeks ago while enroute from Summerside to Charlottetown we chanced to meet our young friend W. R. Clark, of the firm of Wm. Clark & Sons, Maple Grove Farm, North Wiltshire, P. E. I. who extended a cordial invitation to stop off at their station and spend the night at his home.

We gladly accepted the invitation as we were desirous of seeing their magnificent herds and flocks of Jerseys, Yorkshires, Leicesters and Plymouth Rocks on the home farm. We had seen them previously at several P. E. I. exhibitions and had between times heard a great deal of the good work that the Jerseys were accomplishing in the Test.

We arrived at Maple Grove Farm quite late at night and on the morrow we had the pleasure of accompanying Mr. Clark Sr. and his two industrious sons while they attended to the comforts of their herds and flocks. Each member has his own particular duties to attend to and in this way everything is done with a ship-shape regularity and persision that can never be in cases where everyman's job is nobody's job.

Maple Grove comprises about 200 acres of gently sloping, free from stone, well drained, clay loam, subdivided as follows:—Wood lot, 30 acres; rough pasturage, 30 acres and the balance cultivated under a five year rotation system:—Grain, 60 acres; clover and timothy hay, 50 acres; hoed crops consisting of potatoes, turnips, mangles and corn, 15 acres.

The five year rotation practiced is as follows:—First year, grain; second year, roots; third year, grain; fourth year, hay; fifth year, pasture.

Very special attention is given to the eradication of weeds and in so doing the splendid flock of pure bred Leicesters, in the breeding of which Messrs. Clark specialize, play a very important part. In regard to sheep Messrs. Clark say :—"We consider sheep an important item on the farm as they bring in a good yearly profit and also because they are especially valuable in clearing up the weeds, turning them into manure and thus enriching the pastures to a marked extent." We saw the Leicesters quietly grazing at pasture and were pleased to note the uniformity of the flock. There was not a weak one among them.

New blood is introduced into the flock as good breeding principles demand and in this way coupled with a liberal feeding system the standard of excellence is easily enhanced and maintained. A finely bred flock of Plymouth Rocks have their home on Maple Grove Farm and by systematic feeding and care they return a handsome profit to their owners.

The Maple Grove Jersey herd comprise about forty head and they are considered by persons, who are in a position to know, to be one of the best working Jersey herds in the Maritime Provinces. Their accomplishments at the pail and in the test are most gratifying to their owners and inspiring to the visitor who may take the trouble to look over their records. In yearly production the Maple Grove Jerseys range from 300 to 600 pounds of butter. The herd is headed by the milky looking bull, Dreadnought of St. Lambert.

It has been Messrs. Clark's breeding policy for many years to aim for size and capacity as well as quality in their cows. To accomplish this result they give their heifers plenty of time to develop and by so doing coupled with a system of liberal feeding they have succeeded in establishing a herd of Jerseys that in point of size and conformation are second to none.

While they have been able to increase the capacity of their cows for the consumption of food and the strength and robustness natural to large cows, Messrs. Clark have at the same time retained those very desirable qualities found in the well cared for Jersey, viz:—economic production and quality of product.

The policy on Maple Grove Farm is to raise all the feed used on the farm excepting some bran and oil cake and cotton seed meal. The greater portion of the meal ration is crushed oats, and they are found to be good food for the production of milk and, moreover, they can be grown in abundance on the farm, as testify the barns filled to overflowing and a large number of stacks of hay in the rick yard. Soiling crops and fodder corn are extensively grown and are used to tide over the season of short pasturage and in this way the cows are kept doing their best under ideal summer conditions for long periods. Turnips and mangles play an important past ia making up the succulency of the winter rations.

As a side line to dairying Messrs. Clark find that pigs fill the bill admirably. Several pure bred Yorkshires are always on hand and a dozen or more shoats are prepared for market each spring and fall. While the Island market for pork is not all that could be desired the pigs bring in a reasonable profit by converting into cash the by-products of the dairy which would otherwise be wasted.

Butter is manufactured on the farm and as it is a gilt edged quality attractively put up it finds a ready market in Charlottetown at the highest prevailing figures.

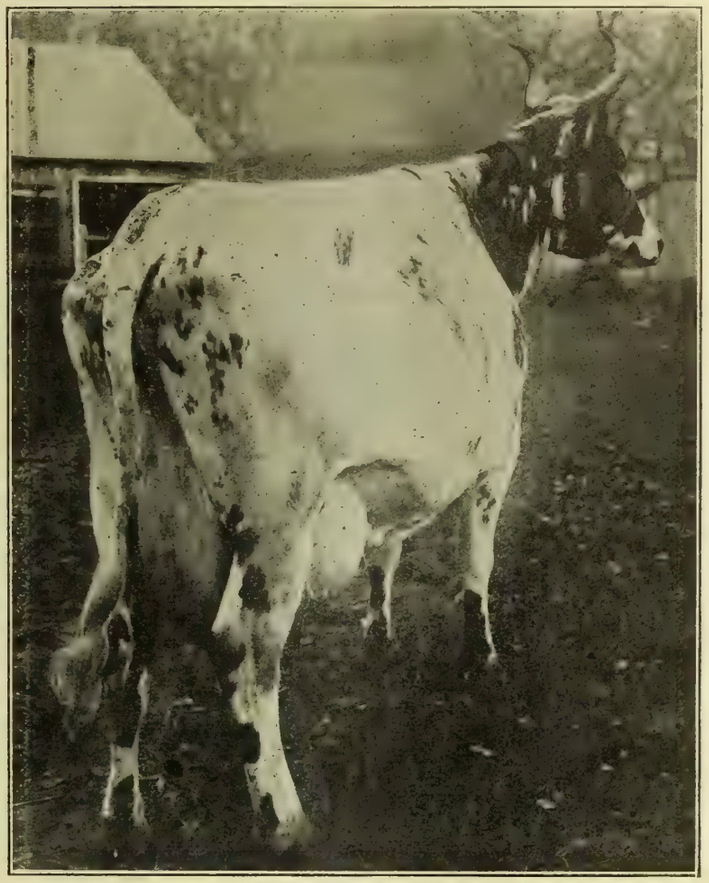
The farm, as already stated is on a gentle slope. The farm buildings are arranged in a hollow square and are neatly kept in good repair.

Mr. Clark Sr. is a hale aad hearty, jovial P. E. Islander of English descent. He belongs to that class of fathers who have the tact and business ability to work with their sons so that they have natural interests in the upkeep of the farm. The boys take a pride in their work worthy of emulation by many more of our young men. Would that we had hundreds more like them. The exodus from our rural communities would be greatly diminished and the whole country side would be brighter and better.

When the judges placed the awards in 1911 for the best kept farm in Queens County, P. E. I., Maple Grove Farm led all the rest. The reasons why—well arranged fields, a systematic rotation of crops, carefully planned systems of tillage, a general neatness about the premises, good stock well kept, the feeding of all farm grown crops on the home farm and nothing sold except as a finished product. What say you reader, are not these points worthy of your emulation?

The milk from each cow in the Maple Grove herd is weighed both night and morning and the individual cow is fed accordingly.

As a result of keeping a large number of live stock, Messrs. Clark have accomplished the gratifying result of seeing the fertility of their farm increasing, and a steady improvement in their crops. The increased humus content of the soil lessening the damage from droughts.



The Ayrshire Cow, Milkmaid 7th--27869

Sweepstakes cow in the 72 hour Dairy Test at the Maritime Winter Fair, Amherst, N. S. This cow for some months also held the world's Ayrshire 2-year-old record of highest production of milk and fat. having given 11,673.5 lbs. milk and 492.75 lbs. fat within the year. She has also won two sweepstakes in the show-ring thus she combines utility with good type. Owned by A. McRae & Sons, Charlottetown, P. E. I.

Instruction in Road Construction at the N. S. A. C. Short Courses.

Realizing the importance of good roads to all rural communities, the Nova Scotia Agricultural College will give at the short courses, during the first two weeks in January, under the direction of the Roads Division of the Department of Public Works and Mines a course of instruction in road construction.

The lectures will not treat of paved streets as are common in cities of Macadam roads such as can be constructed only for truck highways, but will be confined chiefly to dirt roads, such as are most common in rural districts. The lectures will include the following; Hon. E. H. Armstrong, Commissioner Public Works & Mines, Halifax, who will lecture upon the subject of "Present Highway Legislation in the Maritime Provinces."

B. W. MacKenzie, Chief Engineer of the I. C. R.

Dr. L. I. Hewes, of the Department of Public Roads, Washington, D. C., who will give two illustrated evening lectures on Jan. 14 and 15.

H. Donkin, Road Commissioner and Deputy Commissioner Public Works and Mines, Halifax, whose subject will be "Highway Location and Drainage".

R. McColl, Assistant Road Commissioner, Halifax, whose subject will be "Highway Bridges and Culverts."

Prof. J. W. Roland, of the Nova Scotia Technical College, whose subject will be "Road Materials and Road Building and Maintenance"

J. W. MacKenzie, Assistant Road Commissioner, Halifax, on "Road Machinery and its use."

No subject interests the farmer more than this question of road construction and the special course at the Agricultural College on this subject will, we believe be appreciated not only by the farmers but by every interested citizen of the Maritime Provinces who may have the opportunity of attending.

The classes in this subject will be arranged so as not to conflict with the classes in Agriculture, Horticulture, etc. and so that it will be possible for any student to either take this one course by itself or to attend the other more distinctively agricultural classes in addition.

Twelfth Annual Maritime Winter Fair

THE Twelfth Annual Maritime Winter Fair was held in the Fair Building, Amherst, N. S., on December 2nd to 5th inclusive.

The weather man scowled, and dealt out a variety of weather that was not favorable to the best interests of the fair.

Col. H. Montgomery-Campbell, President of the Maritime Stock Breeders' Association, F. L. Fuller, the Secretary-Manager, and their henchmen in the various departments of the fair worked with a will and all things went along decently and in order.

Considering weather conditions the attendance was good and showed that there are no signs of any waning intetest in the Fair.

Visitors, of the observing kind, were well repaid by the evidences of increased interest in live stock improvement that was in evidence at every hand.

BEEF CATTLE

The beef cattle were judged by Mr. John T. Gibson, Danfield, Ont. and gave entire satisfaction. He did his work with that rapidity which characterizes the trained experienced mind.

THE SHORTHORNS

were exhibited by C. H. Angus, Harold Etter, Chas. W. Forrest, Fred. T. Holmes, Geo. M. Holmes, Edwin Forrest, N. Curry, R. A. Snowball, Walter Patterson, J. McCully Pipes and Edward Anderson.

While there were some well fitted animals at the top in each section of the Shorthorn class the average quality of fitness for a fat stock show was not up to the usual high standard. The prize winners lower down in the scale of awards were not so well fitted as they might be and some thin, peaked, paunchy and extremely young stuff did not add to the enthusiasm of the spectators. This was particularly true in the grade classes and in two or three places the judge deemed it advisable to award the lowest prizes in the scale, which will no doubt have the desired effect of fewer unfinished animals for the 1913 Fair.

The two-year-old Shorthorn steer section had fine entries. Harold Etter's white steer and C. W. Forrest's roan, were a well-fleshed, even pair. Etter's steer captured the ribbon for best Shorthorn steer any age.

The senior yearling steers had three entries. The first prize went to Harold Etter's roan, a good, even steer, but with room for a little better fitting. Geo. M. Holmes' roan was a fairly good one but the third entry, shown by another party, was a disgrace to the show and had to take the gate minus the money.

The first and second prize junior yearling steers were a good pair but the other two entries in the class were paunchy and thin.

The first prize steer calf was a good specimen but the other two entries in the class were entirely too young to show to advantage.

Five aged cows appeared before the judge and each one was awarded a prize. The first prize cow was exceptionally good forward of the hook bones but back of the hook bones she did not put up as even an appearance as one could wish.

The champion Shorthorn animal, was Red Blossom, exhibited by R. A. Snowball in the two-year-old heifer class, a closely-built, well-fashioned, Shorthorn. The four entries in this section were all good ones. Red Blossom captured the M. J. O'Brien silver cup. This cup was won in 1909 and 1910 by C. A. Archibald and in 1911 by Harold Etter.

The senior yearling heifer section had only two entries and the junior yearling section,four entries.

One of the best sections of the Shorthorn class was the senior calf class in which Emma of Willow Glen, the champion female at Halifax Exhibition this year, was exhibited. Her three mates in this section were also very smooth, evenly fleshed youngsters.

There were four entries in the junior heifer calf section.

HEREFORDS, ABERDEEN AND POLLED ANGUS CATTLE

competed in the same sections. W. W. Black showed every steer in the class. His Herefords were, as usual, well fitted. The only Angus cattle in the show were a senior yearling heifer and a senior heifer calf exhibited by A. O. F. Gill, of Prince Edward Island.

The best animal, any age, in the class was Gill's senior yearling heifer. There were no discreditable animals in the class.

The W. W. Black, Silver Cup for the best grade animal, won in 1911 by E. P. Anderson, was won by Fowler Bros. with a smooth, evenly fleshed, two-year-old Shorthorn grade steer.

The Amherst Foundry prize for the second best grade animal, any age, was captured by Chas. W. Forrest.

The Massey Harris, sweepstakes, steel harrow for best beef animal, any grade or breed went to Snowball's Red Blossom.

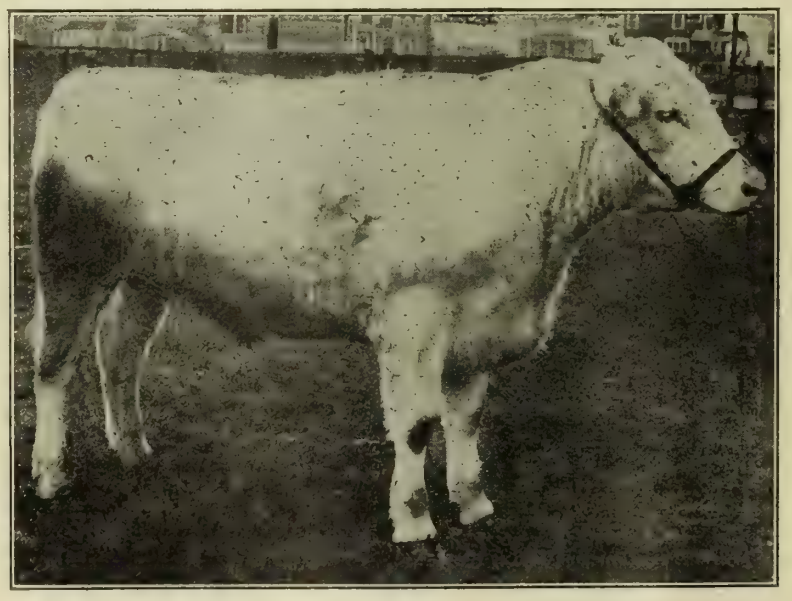
The Blatchford specials went to Thos. J. Etter and R. A. Snowball.

The dressed beef carcass prizes were awarded as follows;—

1. Fowler Bros. on 2nd. prize two-year-old Shorthorn grade steer.
2. Chas. W. Forrest on 2nd prize two-year-old Shortnorn steer.
3. Harold Etter on 1st prize two-year-old Shorthorn steer.
4. W. W. Black on 1st prize two-year-old Herefore grade steer.
5. Edwin Forrest on 1st prize two-year-old Shorthorn grade heifer.
6. R. A. Snowball on 2nd prize two-year--old Shorthorn heifer.

Red Blossom

Sweepstakes Shorthorn and Best Beef Animal, any age, at the 1912 Maritime Winter Fair. Owned by R. A. Snowball, Chatham. N. B.



Best Shorthorn Steer at the 1912, Maritime Winter Fair. Owned by Harold Etter, Westmorland Point, N. B.

DAIRY CATTLE

The most outstanding feature of the Maritime Winter Fair is the dairy cattle sections where this year no fewer than ninety head of Shorthorns, Ayrshires, Holsteins, Guernseys, Jerseys and Grades were entered in the seventy-two hour test.

The dairy tests were conducted by Messrs. Harvey Mitchell and W. A. McKay.

Following are the principal rules governing the test;—

The cows in the test shall be milked dry in the presence of the judges at 1 p. m., November 29 and the test will conclude at 1 p. m. on December 2nd, the percentage of fat in the milk will be determined by the Babcock milk tester and the percentage of solids not fat, by the use of the authorized formula for the purpose.

The standard of the respective cows will be computed on the following scale; 25 points for each pound of fat; 3 points for each pound of solids, not fat; 1 point for each ten days in milk after the first 30 days. Limits ten points.

No cow four years old or over, shall win first prize that does not produce at the rate of 10 pounds of butter per week, or a second or any other prize that does not produce at the rate of 8 pounds of butter per week. No three year old cow shall win a first prize that does not produce at the rate of 9 pounds of butter per week, or a second or any other prize that does not produce at the rate of 7 pounds of butter per week. No heifer two years shall win a first prize that does not produce at the rate of 8 pounds of butter per week, or a second or any other prize that does not produce at the rate of 6 pounds of butter per week. No heifer one year old shall win first prize that does not produce at the rate of 7 lbs. of butter per week, or second or any other prize that does not produre at the rate of 5 lbs. of butter per week.

On other pages of this issue will be found a full record of each cows performance. The reader can readily ascertain by a little study of the figures given, which individuals of the respective breeds and respective ages did the best. It will also be interesting to note the variations in quantity and quality of milk of the various milkings.

The T. Eaton Co. special prize for the best pure bred herd of milk cows —one aged cow, one three-year-old, and one two-year-old was won by Logan Bros.

The T. Eaton Co. special prize for the best grade breed of milk cows— one aged cow, one three-year-old cow and one two-year-old heifer went to T. W. Keilor's herd.

The Holstein-Freisian Association's Silver Cup for the champion cow in the grade class, providing she is sired by a Holstein-Freisian bull was captured by Fowler Bros.' aged cow, Mary, with 238.53 as a total number of points, also capturing the Amherst Trading Co's special prize for second highest scoring cow in the test.

F. S. Black's Neta was the highest scoring three-year-old with 206.18 as her total number of points thus winniag the Canadian Ayrshire Breeders Association $50.00. Mr. Black won this prize seven or eight years ago and since then it has gone by default as the highest scoring three-year-old in the test during the last few years has been a breed other than Ayrshire.

The king pin cow and chief attraction of the show was A. McRae & Sons, Milkmaid 7th which with a score of 240.12 led all her competitors, winning the Ayrshire Breeders' Association prize of $50.00 for the highest scoring aged cow, if she be an Ayrshire and also the Henry Birks & Sons' Silver Cup for the highest scoring cow, any breed or grade in the test. This cup was won in 1908 by W. W. Black, in 1909 by Logan Bros., in 1910 by T. W. Keilor and in 1911 by S. Dickey & Sons.

Milvmaid 7th at one time held the world's record as the highest producing two-year-old Ayrshire. ...

One of H. S. Pipes & Son's Jerseys, Blood's Choice, headed the two-year-old class with a score of 188.59 points.

The chief honor in the yearlings section was captured by Logan Bros.' Island Lassie with a score of 135.35.

SHEEP

The sheep classes were a uniform, well fitted lot. There was not a sheep in the building of which any of the owners had any reason to feel ashamed.

The full list of awards will be found on other pages of this issue. R. H. Harding, Thorndall, Ont., placed the awards.

The dressed carcasses numbered eighteen. Jas. I. Stewart led the way in the over one-year-old class with a grade Shropshire wether and in the under one-year class with a pure bred ewe lamb.

The Blatchford Calf Meal Factory special prize for the best wether lamb was captured by one of Albert Boswalls Sr.'s Leicesters.

The Robb Engineering Co's specials for the best four lambs, all one breed won by Boswall's Leicesters and Oliver C. Saunders' Southdowns.

The Bank of Montreal Special for the best Oxford, Hampshire or Suffolk ewe was won by J. E. Baker & Sons and the same firm's special for best Cotswold or Cheviot ewe was won by John Tweedie.

The Hewson specials for best flock of short wool sheep went to Jas. I. Stewart and Burder Goodwin.

The Canadian Bank of Commerce specials for the best three shearling wethers was captured by Jas. I. Stewart and S. C. Lane.

The New Brunswick Wire Fence Co., Amherst Hotel and Maritime Farmer's specials for best pen of four wether lambs were awarded to Oliver C. Saunders, Jas. I. Stewart, Geo. L. Boswall and J. E. Baker & Sons.

The Royal Bank of Canada specials for pen,1 ewe lamb, 1 yearling ewe, 1 ewe, 2 years old or over were awarded to J. E. Baker & Sons and Albert Boswall.

SWINE

were a uniformly good lot and were judged by Prof. L. Stevenson of the N. S. A. C. There was a lively competition in every class and the awards will be found elsewhere in this issue.

The Dominion Swine Breeders' Association prizes for:

Best sow 9 months and under 15 months.

Best sow 6 months and under 9 months.

Best sow under 6 months, in each of the three Maritime Provinces were won respectively as follows:—

In Nova Scotia—1, Fowler Bros.; 2, Jas. I. Stewart; 3, Fowler Bros.

In New Brunswick—1, T. J. Etter; 2, Edward Anderson; 3, Chas. Etter.

In Prince Edward Island—1, 2 and 3, Stewart Bros.

The Atlas Stock Food Co. Silver Cup for the best animal, any breed or grade, from a bacon standpoint, won in 1910 and 1911 by W. J. Gibson was this year captureed by one of J. W. Callbeck's Yorkshires.

The Percy P. Evans Silver Cup for the best pen of three, including sow under 6 months, sow, 6 months and under 1 year and sow, over 1 year, won in 1911 by A. A. McBeath went to Stewart Bros. on a pen of Yorkshires.

The dressed swine carcasses numbered sixty-eight.

The awards will be found elsewhere in this issue. Gibson's Tams. led the way and were followed down the list as follows:—

Yorkshires in 2nd, 3rd, 9th, 10th and 12th places.

Berkshires in 4th, 5th, and 11th places. A Berk. and Tam. in 6th position and grade Yorks in 7th place.

THE JUDGING COMPETITIONS.

which were conducted on Wednesday were well patronized by the N. S. A. C. students and also a number of non-students. The prize winners were as follows;—

Beef Class—1, Walter Shaw; 2, A. C. Starr; 3, J. W. Landells; 4, C. E. Boulden; 5, R. A. Weldon.

Dairy Cattle—1, G. C. Hanna; 2, A. O. F. Gill; 3, J. G. Archibald; 4, Gerald Hubbard; 5, Jas. Retson.

Sheep—1, A. O. F. Gill; 2, Walter Shaw; 3, H. C. Secord; 4, H. P. Munroe; 5, W. N. Keenan.

The Prof. M. Cumming cup for the person making the highest score in judging, dairy cattle, beef cattle and sheep went to A. O. F. Gill, York, P. E. I.

The M. S. B. A. cup for the person, not a regular student of the N. S. A. C. making the highest score judging in the foregoing mentioned classes was won by Jas. Retson, Truro, N. S.

THE POULTRY EXHIBIT

as usual was one of the chief attractions at the fair.

W. A. Brown, Ottawa, Geo. Robertson, Ottawa and J. Fred Watson, Nashua, N. H. placed the awards. J. P. Landry, of the N. S. A. C., had charge of the department. Over 2050 birds of the various popular breeds were exhibited in the open and utility sections.

The open sections were a particularly good lot. R. I. Reds, Barred Rocks, White Wyandottes, and White Leghorns predominated in point of numbers but all classes were well represented by birds which would be hard to beat in any competition. There were no walk-overs as far as prize winning was concerned.

The utility pairs and breeding pens were also a good lot. Barred Rocks and White Wyandottes led in point of numbers.

In mating pens there were eleven entries of Barred Rocks and three entries of Brown Leghorns.

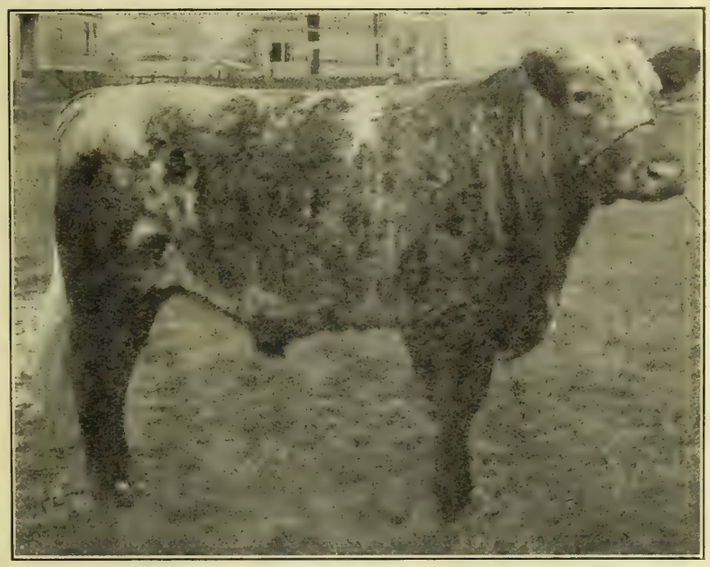
There was a goodly share of ornamental and pet stock.

TURKEYS, GEESE AND DUCKS

were out in large numbers and had lots of quality. L. H. D. Foster had the best cockerel and pull?t in the American variety, a pair of Barred Rocks. L. A. Haszard won the special for best cockerel and pullet in the English varieties on a pair of Buff Orpingtons.

Craig Bros. had the best cock, hen, cockerel and pullet in the Barred Rock class while Watson Lutz had the second best quartette.

The Maritime Poultry Association Silver Cup for the best exhibit of American breeds of poultry, won in 1910 by Seth Jones and in 1911 by Hartland Poultry yards was again captured by the latter firm.



Best Grade Steer at the 1912 Maritime Winter Fair. Dressed first prize carcass. Owned by Fowler Bros.. Amherst Point, N, S.

Best Hereford Steer at the 1912 Maritime Winter Fair. Owned by W. W. Black, Amherst, N. S.

The Percy Johnson cup for the best exhibit of poultry, including American breeds and Bantams, won in 1911 by Hartland Poultry yards is now held by Kingsdale Poultry & Supply Co.

The Silver Cup donated by the late Hon. W. T. Pipes for the best cock, hen, cockerel and pullet, won in 1908 by Craig Bros., in 1909 by Craig Bros., in 1909 by Hazard and Duchemin and in 1911 by A. C. Read was again captured by A. C. Read's White Wyandottes.

Craig Bros. won the Kingsdale Poultry & Supply Co's Silver Cup in the Utility classes.

THE DRESSED POULTRY EXHIBIT

was the best display ever made at the Maritime Winter Fair. The Maritime Poultry Association monies for the best 12 chickens packed in suitable box for export went to Jack Thompson, Fort Lawrence, and the Hartland Poultry yards.

T. J. Etter and Hartland Poultry yards had the first and second best exhibits of dressed poultry.

The best six dressed chickens, any variety, were shown by John R. Harrison.

LADIES JUDGING COMPETITION

prizes in the section open to ladies of the Amherst Hospital Aid Society, for the best judging of chickens, geese turkeys and ducks, were captured by Miss Helen Christie, and Miss Harding.

Miss Pipes, Mrs. Geo. Ripley and Mrs. R. Embree were the prize winners in the judging section open to farmers' wives and daughters, not members of the Amherst Hospital Aid.

POULTRY PLUCKING CONTEST

prizes in the section open to boys under 15 years were won by Frank Cooke, Geo. McWilliams, Fred Noiles and V. Doncaster.

C. J. Cock, T. C. Latham, F. D. McCurdy and E. C. Black won in their respecttive places in the poultry plucking contest for boys, over 15 years.

THE FRUIT EXHIBIT

was not up to the usual in point of quantity but there were some very fine samples in the display. Worthy of special mention were the displays made by W. B. Wallace of Hants Co., N. S. and S. L. Peters of Queens Co., N. B. In the latter display a plate of Bishop Pippons was considered by S. C. Parker, the judge, to be almost perfect.

Mr. Peter's collection was awarded the Spramotor Co's prize for best collection of fruit. The collection contained Wealthy, McIntosh Red, Gravenstein, King of Thompkins, Northern Spy, Fameuse, Alexander, Bishop Pippin and Golden Russet varieties.

THE SEED DEPARTMENT

was well filled with Wheat, Oats, Barley, Buckwheat, Peas, Beans and Potatoes. Ther was an exceptionally good showing of Timothy seed.

One particularly interesting feature of the seed exhibition is the section filled by members of the Canadian Seed Growers' Association. This year the members excelled themselves and a goodly number of new beginners had entries in this section.

The best exhibit of seed grain was made by E. J. Vessey and consequently he won the silver cup donated by Wm. Ewing, Seedsman, Montreal. This cup was won in 1910 by A. E. McLean, P. E. I., and in 1911 by Ernest W. Bulman, Rusticoville, P. E. I.

W. H. McGregor, P. E. I. won the Steel Briggs Seed Co. Silver Cup for the most creditable showing of not more than three varieties of selected seed. This cup was won in 1910 and 1911 by the late Robert McKay, Millsville, Pictou Co., N. S.

The D. J. Robertson Gold Medal to the boy or girl having the best exhibit of white oats was won by John A. Semple, Brule, N. S.

'r the auditorium on Monday, Tuesday and Wednesday evenings by men prominent in the public affairs of the Maritime Provinces and by Prof. H. S. Arkell, Prof. L. Stevenson, John T. Gibson, R. H. Harding, Prof. J. H. Grisdale, R. S. Stevenson, W. A Brown and others were attentively listened to by large audiences. Some of the subjects discussed were: "Increasing Live Stock Production in the Maritime Provinces", "The Breeder's Work," "Some Phases of the Beef Question," "Sheep Industry" "The Canadian Farmers' Laboratory, Dominion Experimental Farm", "Dairying" and "Poultry".

The special prizes were distributed on Thursday evening by Mr. A. D. Ross, Amherst.

Results of the 72 Hour Dairy Test at the 1912 Maritime Winter Fair.

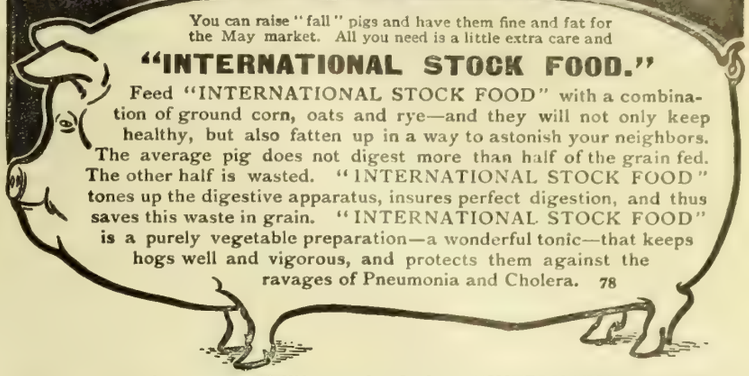
A Prize Food for Prize Stock



You can raise "fall" pigs and have them fine and fat for the May market. All you need is a little extra care and

"INTERNATIONAL STOCK FOOD."

Feed "INTERNATIONAL STOCK FOOD" with a combination of ground corn, oats and rye—and they will not only keep healthy, but also fatten up in a way to astonish your neighbors. The average pig does not digest more than half of the grain fed. The other half is wasted. "INTERNATIONAL STOCK FOOD" tones up the digestive apparatus, insures perfect digestion, and thus saves this waste in grain. "INTERNATIONAL STOCK FOOD" is a purely vegetable preparation—a wonderful tonic—that keeps hogs well and vigorous, and protects them against the ravages of Pneumonia and Cholera. 78

Make a nice profit on your "fall" pigs by feeding "INTERNATIONAL STOCK FOOD." Get a pail to-day from your dealer.

INTERNATIONAL STOCK FOOD CO., LIMITED **TORONTO**

Another Good Testimonial in Favor Of

VIGORA

"MR. J. B. MORIN:—I certify to have treated my mare for a chronic cough from which she suffered for two years, and when I commenced to use VIGORA she was so sick that she could do nothing but the lightest work. Today she is perfectly well and can, as in the past, travel long distances quickly."

Signed, ELEZAR ALAIN,
Ancienne Lorette.

A crackerjack of a Christmas present

Big Ben

REMEMBER when you were a kid?—the presents that were all *shiny* and bright and that *worked*?—weren't *they* the ones that you were proudest of?

Something for your room—something you could *use all year*—something like *big people* had in *their* rooms. Didn't sensible presents appeal to you best when you were a kid? Think back a bit and see.

Then think of Big Ben for those boys and girls.—Toys, of course, should never be displaced. It wouldn't be Christmas without them, but mix in *useful* things—things that develop *pride* and make little people feel responsible. Give them presents to *live up to* and to *live up with*. Don't make the mistake of thinking they don't feel the *compliment*.—Let one of the first things that greets your little boy and girl Christmas morning be that triple nickle-plated, handsome, pleasant-looking, serviceable and inspiring clock-alarm—BIG BEN.

Just watch if they don't say, "Isn't that a crackerjack! Why! is that for me to use myself?" — Then see how proudly they carry Big Ben upstairs "*to see how he looks in my room.*" Just put yourself in that boy's or girl's place.

Big Ben *is a crackerjack-of-a Christmas-present* to give to anyone. The fact is, he is two presents in one, a dandy alarm to *wake up with*, a dandy clock to tell time *all day* by. And he's as good to look at as he's pleasing to hear.

He stands *seven inches* tall, slender, handsome, massive, with a big, frank, honest face and big, strong, clean-cut hands you can see at a glance in the *dim morning light* without even having to get out of bed.

He's got an inner vest of steel that insures him for life; large comfy keys that almost wind themselves, and a deep, jolly ring that calls just when you want and either way you want, *five straight minutes* or *every other half minute for ten minutes*, unless you flag him off.

Big Ben is sold by 18,000 watchmakers. If you can't find him at your jeweler's, a money order mailed to his designers, *Westclox, La Salle, Illinois*, will send him when and wherever you say, attractively boxed and express charges paid.

$3.00

Flour and Breadmaking.

(Continued from last issue)

NUTRITIVE VALUE OF WHITE AND BROWN BREAD.

The comparative nutritive value of white and brown bread has always been a subject of controversy. The theory is advanced that in preparing the finer flours much of the most nourishing of the food materials are removed, and, consequently, the whole wheat, or Graham flour is the most nutritious and healthful. In studying the nutritive value of any food it must always be borne in mind that it is not the flour or bread that contains the highest percentage of the is the most nourishing, but it is the most valuable food constituents that one that contains the most of these constituents in a form that is capable of being absorbed. The coarser flours have a higher percentage of protein, fat, and mineral matters than the finer grades, and so has bran; but, owing to the amount of crude fibre, or cellulose, surrounding these materials, they are not so well assimilated, and they really furnish less nourishment than is obtained from the bread made from the finer grades of flour. The work of Snyder, of Minnesota, Wood and Merrill, of Maine, and others, have clearly shown this. A few figures taken from Bulletin No. 101 of the Office of Experiment Stations, Department of Agriculture, will illustrate the point.

In the work referred to the different grades of flour experimented with were made from one stream of wheat, the flours and the bread made from them were analyzed, and the digestibility of the bread determined. We shall only refer to three grades of flour—i. e., the standard patent, or straight grade, which represented about 96 per cent. of the total flour from the wheat; the entire wheat flour, which is made by removing part of the outer bran layers and then grinding, and a true whole wheat or Graham flour, i. e., a flour made from the clean, scoured wheat without any bolting process. The composition of these three kinds of flours was found to be as follows:

COMPOSITION AND HEAT OF COMBUSTION OF THE FLOURS.

	Water	Protein	Fat	Carbohydrat's	Ash	Phosphoric acid	Heat of combustion	
	%	%	%	%	%	%	Calculated calories	Determin'd calories
Standard patent or Straight	10.54	11.99	1.61	75.36	.50	.20	4.022	4.050
Entire wheat flour	10.81	12.26	2.24	73.67	1.02	.54	4.026	4.032
Graham flour	8.61	12.65	2.44	74.58	1.72	.71	4.123	4.148

No crude fibre is given in the above table, but it would increase as we pass from the finer to the coarser flours. The percentage of fat and protein also increases, but the carbohydrates decrease, and the difference here would be still more pronounced had the crude fibre been separated.

When the bread made from these three flours was submitted to digestion experiments the following results were obtained:

DIGESTIBILITY OF NUTRIENTS AND AVAILABILITY OF ENERGY OF BREAD.

	Protein	Fat	Carbohydrates	Energy
	%	%	%	
White Bread	85.8	56.4	97.5	90.1
Entire-wheat bread	80.4	55.8	94.1	85.5
Graham Bread	77.6	58.0	88.4	80.7

This means that in these experiments 85.8 per cent. of the protein in the bread from the straight grade flour was digested and only 77.6 per cent. of that in the German bread. Furthermore, while 90.1 per cent. of the total fuel or energy value of the white bread was available, only 80.7 Graham flour was of use to the person eating the bread.

The same bulletin shows that the bread from the first patent, which represents about 35 per cent. of the finest of the flour, is even more digestible than that from the straight grade flour.

In 1857 Laws and Gilbert, of the Rothamsted Institution, England, studied the same question; and, in view of the fact that the roller process of making flour was not then in use, their conclusions will be of interest. Writing in 1881, Gilbert summarized their conclusions as follows: "The higher percentage of nitrogen in bran than in fine flour has frequently led to the recommendation of the coarser breads as more nutritious than the finer. We have already seen that the more branny portions of the grain also contain a much larger percentage of mineral matter. . . It is, however, we think, very questionable whether upon such data alone a valid opinion can be formed of the comparative values as food of bread made from the finer or coarser flours from one and the same grain. Again, it is an indisputable fact that branny particles, when admitted into the flour in the degree of imperfect division in which our ordinary milling processes leave them, very considerably increase the peristaltic action, and hence the alimentary canal is cleared much more rapidly of its contents. It is also well known that the poorer classes almost invariably prefer the whiter bread; and among some of them who work the hardest and who, consequently, would soonest appreciate a difference in nutritive quality (navvies, for example), it is distinctly stated that their preference for whiter bread is founded on the fact that the browner breads pass through them too rapidly; consequently, before their systems have extracted from it as much nutritious matter as it ought to yield them. It is freely granted that much nutritious matter is, in the first instance, lost as a human food in the abandonment of 15 to 20 per cent. of the wheat grain to the lower animals. It should be remembered, however, that the amount of food so applied is by no means entirely wasted. And, further, we think it more than doubtful, even admitting that an increased proportion of mineral and nitrogenous constituents would be an advantage, whether, unless the branny particles could be either excluded or so reduced as to prevent the clearing action above alluded to, more nutriment would not be lost to the system by this action than would be gained by the introduction into the body, coincidentally with it, of a larger actual amount of supposed nutritious mat-

ter. In fact, all experience tends to show that the state, as well as the chemical composition of our food, must be considered; in other words, that its digestibility and aptitude for assimilation, are not less important qualities than its ultimate composition.

"Of course, if the branny particles were reduced to a perfect state of fineness, and it were found that this prevented the aperient action, and that other evils were not introduced; or, better still, if more of the food materials can be separated from the bran, and in either case without more cost than the saving would be worth, there might be some advantage. But to suppose that whole wheat meal as ordinarily prepared is, as has generally been assumed, weight for weight, more nutritious than ordinary bread flour is an utter fallacy, founded on theoretical text-book data, not only entirely unsupported by experience, but inconsistent with it. In fact, it is just the poorer fed and the harder working who should have the ordinary flour bread rather than the whole-meal bread as hitherto prepared, and it is the overfed and the sedentary who should have such whole-meal bread. Lastly, if whole grain were finely ground, it is by no means certain that the percentage of real nutritive nitrogenous matters would be higher than in ordinary bread-flour, and it is quite a question whether the excess of earthy phosphates would not then be injurious."

The previously presented results on the digestibility of different kinds of bread confirm the above conclusions of Laws and Gilbert. In concluding the discussions on the nutritive value of bread, we submit the conclusions of a study of the composition and digestibility of white and whole-wheat bread given in the St. Bartholomew's Hospital Report, London, England, 1897'

"From the experiments we are justified in concluding that the higher nutritive value which we might, upon pure chemical grounds, ascribe to brown bread, cannot, with the single exceptions of fats and mineral constituents, be maintained from the physiological side. On the other hand, distinctly less nutritive materials actually get into the blood in the case of the brown than of the white bread.

"White bread is, weight for weight, more nutritious than brown. Therefore, it appears the preference given by operators in large towns for white bread has to a certain extent a sound physiological basis-

able intestines white bread is to be preferred to brown.

"In the case of people with irrit-

"In the case of people with sluggish intestines brown bread is preferable to white, as it tends to maintain regular peristaltic action and ensure regular evacuation of the bowels, with all its attendant advantages.

"In the cases where the proportion of mineral ingredients, and especially of lime salts, in other articles of food or drink is insufficient, brown bread is preferable to white.

"If the dietary is insufficient in fat, or if the patient is unable readily to digest fat in other forms, brown bread may possibly be preferable to white."

In this country, where everyone eats a very varied diet, it is doubtful if a sufficiency of ash materials and fat are not taken into the system without using the bread from the coarser flour for the purpose of obtaining these substances. Moreover, it is evident that the comparative nutritive value of white and brown bread varies with the individual.

Weak Men, Read

Perfect health and strength denote the absence of disease. When you are weak it means that you lack that which is the foundation of strength—of life itself—Electricity. You may be afflicted with Rheumatism, Dyspepsia Lame Back, Weak Kidneys, Nervous Debility, Sciatica, Constipation, or any of the numerous diseases which lead to an early breaking down of the system. If you have any of these troubles they should be attended to at once. You have tried drugs, and found that if they even stimulated you they did not cure, but left you with some new trouble as a result of the poison put into your system.

It is pitiable to think of the vast number of men who go on from day to day suffering mental and physical torture as a result of their weakness, while right at their doors other men are being cured of the same disease. One who has not known it himself cannot realize the feelings of a man in an advanced stage of Nervous Debility, nor does he hear it, for these men do not talk of their troubles. Even when they are fortunately led to use the remedy which is now so well known—Dr. McLaughlin's Electric Belt---and are cured by it, they do not mention it to their closest friends; hence the prevalence of this trouble, and the means of cure are appreciated only by those who have had experience. And yet I have thousands upon thousands of grateful patients who are willing to testify to their cures by

Dr. McLaughlin's Electric Belt

and who would be glad to share their knowledge with others if written to. I send the names of these men to any one who requests them. There is not another remedy in the world to-day that has proven as effective. Its cures speak volumes for the good work it has accomplished.

Dear Sir,—I have used your Belt since last November, and I feel much better. The emissions have stopped entirely. I am well pleased with the Belt. It has proved all you claimed for it. Yours respectfully, DANIEL CHATTERTON, Cobalt, Ont.

Dear Sir,—I am glad to say that your Belt has made a permanent cure of my case. After using the Belt and following directions for three months I felt like a new man, and have not used it since. As it is now over eighteen months since I stopped using the Belt, and have had no return of my trouble, I find I am cured, and words cannot express the gratefulness I have towards you and what your Belt has done for me. Before using your Belt I weighed 140 and now I go 170. I am recommending your Belt to all my friends. I remain, yours truly, LEON ROLFE. Lime Ridge, Quebec.

Dear Sir,—I have worn my Belt for a month, and I am well pleased with the results. I feel better in every way; have a good appetite. and my food digests well. Yours very truly, IRA S. ACKER, Birchtown, N. S.

Dear Sir,—I have worn your Belt for a month now, and I am glad to say that I have received the greatest benefits from it. My back is a great deal stronger, and the pain in my legs and arms have gone and I am feeling like a new man already. You may use this letter in any way you wish. Wishing you every success, I remain, Yours truly, WILLIAM McCONNELL, Bon Accord, Vic. Co., N. B.

I cannot take up more space with those extracts. But if you will send me your address I will mail you free my beautifully illustrated book, along with testimonials from thousands of grateful people who have been fully restored to health and strength.

This appliance has cures in almost every town and city in the country, and if you will write me I will send you testimonials given to me by people that are probably well known to you. My Belt not only cures weakness, but Rheumatism, Sciatica, Lumbago, Backache, Kidney Trouble, Nervousness, Constipation, Indigestion and Stomach Trouble. I have a beautiful 80-page illustrated book, which I will mail, sealed, to any address FREE. This book is full of lots of good interesting reading for men. Call to-day. If you can't call, send coupon for Free Book.

COMPARISON OF THE NUTRITIVE VALUE OF BREAD AND SOME OF THE COMMON FOODS.

Bread is often referred to as the "staff of life," presumably because it is so universally used, and because it is one of our cheapest foods, and, at the same time, very nutritious and palatable. It is sometimes spoken of as a complete food, i. e., one that furnishes all the nutrients required to nourish the body and in the proper proportion. It possibly fails somewhat in the latter respect; but, as is well known, the food of man must please the palate as well as satisfy the demands of the body, and to do this we must have a varied and mixed diet. This is not the place to discuss the balancing or cost of diets; but, for purposes of comparison, it may not be out of place to show the amounts of the important food constituents furnished by other common foods. For this purpose we have calculated the weight of protein, fat, and carbohydrates, and the number of calories of heat one dollar's worth of each of the more common foods will furnish. The figures are based on the average composition of the foods as purchased.

In some respects the figures are hardly fair, as some of the foods have to be cooked, whereas the bread is ready for use. If the weight of protein, fat, and carbohydrates furnished by one dollar's worth of flour had been given, they would have been about double that furnished by bread, and much larger than that supplied by oatmeal. However, as the figures stand, it is evident that bread is one of our cheapest foods, and when we take into consideration its palatability and high digestibility, it may well be termed the "staff of life."

LAWNDALE STOCK FARM

We have a special lot of 3 young bulls for sale at a bargain—Two roans dropped December 1911. One, all red, dropped February 1912. Splendidly bred and excellent specimens. Also other pure bred Shorthorns.

Write for particulars.

A Business Herd of Showring Jerseys.

NEAR the town limits of Busy Amherst on the road leading to Nappan, N. S., is the steading of Messrs. H. S. Pipes & Son so well known to our readers and the general public who visit our Maritime exhibitions as the breeders of high class show and producing Jerseys.

We have visited the Pipes farm on several occasions and learned some of the ancient history of their attractive Jersey herd.

About twenty years ago Mr. H. S. Pipes started in the Jersey business, with stock bought from the late B. W. Chipman, Milford, N. S., Prof. M. Cumming's predessor as Secretary of Agriculture for Nova Scotia. This purchase comprised nine heifers in calf, of St. Lambert breeding all sired by Stoke Pogis 2nd. These heifers were bred to a bull bought by Mr. Pipes from Capt. Wm. Ralph, of Markham, Ont. The bull in question was Ethel's John, 39410, in whose veins ran 75 per cent. of Mary Anne of St. Lambert breeding, the old cow that produced 36¾ pounds of butter in seven days. Ethel's John carried more of the old cow's blood than a son.

The get of this grand bull were great butter producers a number of them testing as high as 7 per cent. butter fat and on that account Ethel's John was kept in the Pipes herd for seven years.

The next bull purchased was Minette's Star O'Bay View, of the Minette family. The result of the cross with St. Lambert cows and heifers was most gratifying to the breeders. Minette's Star O'Bay View having proved himself the sire of grand producers was kept in the Pipes herd for upwards of nine years. Among the long list of producers sired by this good old bull is Rubena, 1303 C. J. C. C. which as a two-year-old produced by Babcock test 700 pounds butter in one year or in other words more than her own gross weight. Rubena transmitted her good qualities to her progeny as some of her heifers bid fair to eclipse her in every respect. A daughter just freshened has a grand show ring record although she has not yet reached the three-year-old section of her class. This young thing bids fair to be a forty pound two-year-old as she is even now daily going closer to the forty pound mark.

White Heather

The dam of the 23 months old Ayrshire Bull offered for sale on another page of this issue by J. Frank Roach, Sussex, N. B.

In 1906, Messrs. Pipes wanted a new sire and one of their representatives went to Ontario where he purchased from B. H. Bull & Sons, of Brampton, Old Blue Blood of Dentonia, an Island of Jersey bred bull.

Old Blue Blood's name was famous all over the Dominion as being one of the best Jersey bulls ever imported into Canada.

Blde Blood's daughters in the Pipes herd carry great quality and are also great producers.

For four seasons Blue Blood headed the Pipes herd and at the expiration of that time, notwithstanding his great age, Messrs. Bull & Sons bought him back again for use in their own herd and in exxhange gave Messrs. Pipes their present herd header Imported Fereor, 65433, another Island of Jersey bull. Fereor has also been a happy choice as his heifers, although only in their inafncy, are evidencing the points that stand towards strong dairy and show ring qualities.

Messrs. Pipes have always realized that it was quite possible for show ring and producing to go hand in hand in the same individual and we believe their efforts have been very successful as testify their show ring record since 1905. Today they are considered to be among the top notchers in the Jersey breed.

Messrs. Pipes have no difficulty in disposing of their surplus stock at remunerative prices. They tell us that they have had some grand sales during the year now fast drawing to a close. They experience a heavy demand for family cows and also for herd headers and Agricultural Society bulls. Their main obstacle seems to be the difficulty of breeding fast enough to supply the demand for young stock.

Milk and cream is sold in Busy Amherst where they own their own milk route, the milk going direct from producer to consumer. Messrs. Pipes aim to grow as much roots, ensilage corn and grain on the farm as possible all of which is turned into ready money through the manufacturing medium of the ever popular Jersey cow.

The junior member of the firm, Mr. Roy Pipes, has had the advantages of a good agricultural education. He takes a deep interest in the farm and he and his father work hand in hand for the advancement of Jersey breed interests and agriculture in general. Another example for our young men, who are prone to leave the farm, to follow.

A quiet dependable Gasoline Engine of mighty power. Improved cooling, and ignition systems. Perfect, economical carburetor. The Gilson Engine is approved by the foremost authorities and mechanical engineers. All sizes. Write for catalogue. 40 Founded 1850.

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, *(Licensed Architect)*

10,000 Sold in 30 Days **Price $2.00 Prepaid**

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns. farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS : General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete - Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

THE MARITIME FARMER, SUSSEX, N. B.

The East Court Ayrshire Herd.

PRACTICALLY all our readers are acquainted with the name Retson Bros., some personally some by reputation. Will Retson has been herdsman on the College Farm, Truro for a number of years, while a mile east of the college farm is located, East Court Farm, on which John, George and Jim Retson carry on the breeding of high-class producing Ayrshires and a splendid flock of Leicester sheep, under the firm name of Retson Bros.

Retson Bros. were born and brought up in Scotland, the land of the Ayrshire. They bought East Court Farm in 1908. The farm consists of 160 acres of which 90 acres are under cultivation, 6 acres in orchard and the balance in pasture. They started breeding operations with a herd of ten pure-bred imported Ayrshires and five head of Border Leicester sheep.

In the spring of 1910 they imported the highly bred bull, "Gardrum Prince" selected for the great milk record backing. His dam had a record of 12,637 pounds of 3.8 per cent. milk in 36 weeks. His grand dam, on his sire's side had an official record of over 13,000 pounds of milk in 36 weeks and a private record of 18,000 pounds in 365 days.

Four of Gardrum Prince's half sisters, in 1909 stood highest in the Scotch records for milk and butter fat.

In the spring of 1911 the Retsons found it necessary to make another importation of females to keep pace with the growing demand for stock.

The East Court herd at present consists of upwards of forty head of pure-bred Ayrshires, either imported or from imported stock, selected from such well known herds as Kennedy's of Glenshamrock; Baird's of Gaiclaunch; Reid's of Bonshaw; Faulds of Clerkland, and other noted breeders.

The young stock sired by Gardrum Prince are a thrifty looking lot and excellent specimens of the breed. Many of his get are to be seen in the vicinity of Truro, especially at the College Farm, where he has been extensively used.

Stock from the East Court herd are making a name for themselves in many parts of Canada and the United States.

Among the cows that have recently freshened at East Court are: Ocean Girl and Princess Bell. These cows are in splendid fit and producing from 55 to 60 pounds of milk per day, on quite a light ration. Cotton seed meal constitutes the principal meal fed this year by Retson Bros. as it is not much more expensive than bran or shorts and it has a much higher percentage of feed and manurial value. They find that the cheapest way to make milk at present high prices for grain feed is on a ration of from forty to sixty pounds of roots, with three or four pounds of cottonseed per day, and all the good, bright clover hay they will eat.

Last summer was their first experience in growing corn for ensilage and they are so well satisfied with the results that they are planning to grow it more extensively in future years.

The young stock are wintered on straw and turnips with a mixture of bran, oats and oil cake. They find that their young stock keeps in a vigorous growing, not over fat condition on this ration and that they do exceptionally well after they are turned out to pasture.

Over a score of Border Leicester breeding ewes are kept on East Court Farm, mostly all purchased from the flocks of the Boswalls and the Clarks of Prince Edward Island, with the exception of a few ewes and rams imported from Scotland. The ram in question, "Hillhouse Stamp," from one of the best flocks in Scotland was a noted prize winner and he has proved a valuable investment as is shown by his vigorous lambs. Retson Bros. are making good in their chosen profession; they are good citizens and they are setting a good example in showing what may be accomplished in the Maritime Provinces by those whose object is "To will and to do."

ACCEPTABLE XMAS GIFTS FOR GIRLS and BOYS

The Little Ones will appreciate a Christmas Gift of any one of these High Grade Garments, give them the surprise they have been looking forward to. It is not too soon to order now, as the Festive Season is drawing nigh.

QUALITY—ECONOMY—SERVICE

Handsome Coats For Girls

27-624.—Made with fashionable box back, double breasted with large fancy buttons, plain tailored sleeves, patch pockets and turned down collar. Good full cape finished with a) in. band of self material piped in red and finished with small, fancy buttons. A very sensible coat of navy only. Sizes 6 to 14 years. Price $6.98

THIS BEAUTIFUL DOLL

37-104 — Jointed Dressed Doll—20 inch, satin dress, in pink, blue or red, with wide applique lace trimming down front of blouse and skirt, fancy hat to match .. .. .. 98c.

The "Etonia" & "Sou-Wester" Combination

18-600

English single Texture Slip-On Waterproof for Children; finished with Vertical Pockets and wide close fitting collar. This Waterproof is a beautifully finished garment ,and guaranteed absolutely rainproof.

Boy's sizes:—
28 in. to 36 in. chest
36 in. to 46 in. long $4.50

Misses' Sizes:—
26 in. to 32 in. bust
40 in. to 48 in. long $3.98

Hats of Sou' Westers to match—
Sizes 6 1-2 to 7 1-2 .. 59c.

We Prepay all Delivery Charges, the prices quoted are all that we ask you to pay.

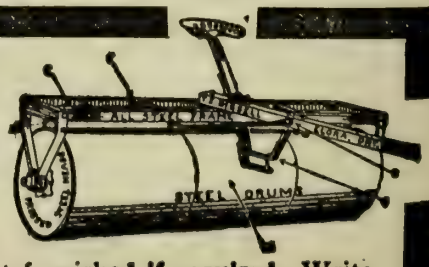
MONTREAL, Canada.

The "Bissell" is a 3-drum roller

3 DRUMS make the best Land Roller. It is easy to understand how the "Bissell" Roller with 3 drums and supported by 6 heads is a STRONGER IMPLEMENT than any 2 drum Roller on the market. With 3 drums the centre bearing is not needed. When the "Bissell" Roller is at work, the axle turns with the drums.

It costs more to manufacture the 3 drum Roller than the 2 drum, but you pay no more for the "Bissell" 3 drum and get BETTER VALUE FOR YOUR MONEY. You get heavier weight in the "Bissell" drums too.

The good points cannot all be told here. Ask your dealer about the "Bissell" Roller and do not be put off with a Roller unless the name "Bissell" is plainly stencilled thereon.



Grass Seeder Attachment furnished if required. Write Dept. M for free catalogue. 63

T. E. BISSELL CO., LIMITED, ELORA, ONT.

Draft Horses, Beef Cattle, Sheep and Apples.

ANOTHER successful example of successful fruit and stock raising in the fruit belt of Nova Scotia is that of Mr. Wm. Sharp, of Windsor Forks, whose farm is located about two miles from the town of Windsor.

We recently visited his farm and there saw the Clydesdale stallion Baron Frederic and also a pair of well bred brood mares weighing about 3200 pounds, that won first and second prizes in their class at the recent Halifax Exhibition. We also saw a pair of three-year-olds, first and second prize winners in their class at the 1911 Halifax exhibition, a mare and gelding, weighing 3,000 pounds, also a promising two-year-old and a lusty pair of yearlings all sired by Baron Frederic.

At the 1911 Halifax exhibition Mr. Sharp's aged mare was first with three of her offspring. She has been a grand good breeder and her offspring are all that any breeder could wish.

The foals are left with the mares until they are about five months old, a longer or shorter period—determined by the amount of work for which the mares are required. The mares are bred to foal in April, and are worked regularly. They are given a rest of about two weeks after foaling after which they are again put to the regular farm work; the foals being left in a box stall in the barn. About the middle of the forenoon and also about the middle of the afternoon the mares are brought to the barn to give the foals a chance to suckle.

Weaning is done gradually and the foals are taught to eat a little grain. In some cases they are taught to drink skim milk.

The first winter rations for the colts consist of oats, bran, cull apples, turnips and hay and about the end of May they go to pasture. They are broken to harness when from two to two and one-half years old and when the opportunity arrives they are sold at remunerative prices.

Besides the prize winnings already referred to Mr. Sharp won a first prize on one of his yearlings and a ?hird prize on a two-year-old in strong competition.

Mr. Sharp also keeps a pure-bred Durham bull and eight or ten cows and a lot of young cattle. They fatten their steers and sell them when they are about two and one-half years old. The calves are allowed to suckle their dams and run with them at pasture.

A flock of twenty Shropshire breeding ewes have their home on this farm and are highly prized by their owner. Dogs do not bother them and they thrive well and the farm thrives with them. Mr. Sharp's Tolouse geese also add to the farm income.

Mr. Sharp has a fine, well cultivated apple orchard of the leading commercial varieties. The average yield is about 600 barrels but this quantity will soon be very materially augmented as a promising young orchard is fast approaching the bearing age.

The rotation followed:—Oats, roots, grain, seeded with timothy and clover followed with hay for two or three years.

Mr. Sharpe has been on his present farm since 1886. He comes of good old English descent and is a thorough horseman. He has proven that stock raising is a valuable asset to the fruit grower.

Horses For the Farmer.

THERE are probably few better ways of benefiting a country than by improving its live stock, it costs no more to feed a first-class animal than an inferior one, and the returns for the former in price and profit in every way, is greater, we in Nova Scotia are perhaps a little behind some of the other provinces in this matter, but we do not mean to remain there any longer. One of the many problems that confront the farmer in the carrying on of his farm operations, is the question of tillage or sufficient power to use the various implements now in use to the very best advantage which every farmer wants to do as quickly as possible, cheaply and effectively, and as no other power can take the place of the horse on account of the variety of the work to be performed, we then have to decide which is the most profitable class of horse for the farmer to raise for the carrying on of his farm operations, and to bring the best returns when offered for sale. It is true that in some cases trotting horses or showy drivers have brought extravagant prices, but both classes are more of a luxury than a necessity, and the draft horse is undoubtedly the most profitable horse for the farmer to raise, because the selling price of a good draft horse in proportion to the cost of raising and breaking, up to four or five years old, is better than can be realized in any other class. The draft colt can also be reared with less risk and liability to accident than those of the lighter class, due to the fact that the draft bred colt is a lighter animal than others of the lighter class, and will also earn his own keep after he is two years old and his education completed in doing the work of the farm, thus the farmer who breeds him can secure his real market value. The good draft mare is one of the most profitable farm products, as she not only pays her way by the work she does, in working the farm, but also pays her owner a divident in the colt she produces. In selecting brood mares they should be of good size, the right conformation, and above all, of a good disposition, so that they can be handled and cared for at foaling time, as it sometimes happens a colt is weak and has to be assisted in getting hold of the teat, and a mare of an ugly disposition will not allow anyone to come near her, and again her offspring is sure to inherit some of her faults. She should also be a good worker, kind and sensible. Breed her to the best pure bred draft stallion obtainable, of good size and above all, of good action, while size and action are both desirable, do not sacrifice action for size. A few miles and a few dollars should not induce any farmer to breed to a cheap stallion to raise a cheap colt, when the services of good draft stallions can be obtained at a reasonable figure. As to what time of the year it is desirable to have the foals come, every one will have to do whatever suits their own particular case. The writer having had some experience with both spring and fall foals, will have to confess that I am not in favor of fall foals, as they often go into winter quarters ill prepared to stand cold weather and warmth and plenty of excercise, plan to have the colts come early in May. Prior to foaling the mare should have daily, morning and evening, a bran mash and plenty of excercise or light work. This should insure (if other conditions are right) an easy foaling and plenty of milk. Do not over feed the mare immediately after foaling but continue the bran mash which will assist in carrying off the fever incident to foaling. From this time on, the mare should have a few cracked oats the quantity depending on the kind of a pasture the mare is likely to be in during the summer. At four and one-half or five months old, the colt should be weaned. The plan I prefer, is to separate the mare and the foal out of hearing distance. The mare should be milked two or three times a day or until she is dry. Put the colt in a good smooth box stall visit it frequently as it will get lonesome. Offer it water often and teach it to eat cracked oats and bran, as the first winter is the most critical time in the colts existence, it should be carefully attended to. Keep the diet as near grass conditions as possible with bran, cracked oats and roots. The colt during the winter should be handled and taught to lead by the halter. The following summer to ensure a steady growth, the colt should have good pasture in which there is shade and plenty of water, the next winter the colt should have plenty of good hay and sufficient roots to keep healthy, towards spring add two or three quarts of cracked oats per day, at which time the colt should be handled and harnessed and taught to do light work, and from this time on, be worked and developed to the owners liking. Formerly many of our farmers thought the draft horse too large for farm work but we are fast coming to appreciate his merits on the farm as well as to sell, and the lumber woods, stone and gypsum quarries are constantly calling for good draft horses, but the farmers who do not read stock journals and learn the experience of others go on in blissful ignorance and complain of the times the middle man and the world as all wrong, while if they would wake up and attend the short courses at the Agricultural College at Truro, read and think and act, and improve their stock and their farming methods, they would have no cause to complain.—Address by Wm. O'Brien, Windsor Forks, N. S. before the N. S. F. A.

"Clay" Gates

STRONGEST and best farm gate made. 30,000 sold in 1912. Can't sag, bend or break. Can be raised as shown. Good for Winter and Summer. Send for illustrated price list.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

Let me remember how it used to be and bring one morning back again.

I came into the second-best parlor after breakfast, with my books, and an exercise book, and a slate. My mother is ready for me at her writing desk, but not half so ready as Mr. Murdstone in his easy-chair by the window (though he pretends to be reading a book), or as Miss Murdstone, sitting near my mother stringing steel beads. The very sight of these two has such an influence over me that I begin to feel the words I have been at infinite pains to get into my head, all sliding away, and going I don't know where. I wonder where they do go by-the-by?

I hand the first book to my mother. Perhaps it is a grammar, perhaps a history or geography. I take a last drowning look at the page as I give it into her hands, and start off aloud at a racing pace while I have got it fresh. I trip over a word, Mr. Murdstone looks up. I trip over another word. Mr. Murdstone looks up. I redden, tumble over half-a-dozen words and stop. I think my mother would show me the book if she dared, but she does not dare, and she says softly:

"Oh, Davy, Davy!"

"Now, Clara," says Mr. Murdstone, "be firm with the boy. Don't say, 'Oh, Davy, Davy'. That's childish. He knows his lessons, or he does not know it."

"He does not know it," Miss Murdstone imposes awfully.

"I am really afraid he does not," says my mother.

"Then you see, Clara," returns Miss Murdstone, "you should just give him the book back, and make him know it."

"Yes, certainly," says my mother; "that is what I intend to do, my dear Jane. Now, Davy, try once more, and don't be stupid."

I obey the first clause of the injunction by trying once more, but am not so successful with the second, for I am very stupid. I tumble down before I get to the old place, at a point where I was all right before, and stop to think. But I can't think about the lesson. I think of the number of yards of net in Miss Murdstone's cap, or of the price of Mr. Murdstone's dressing-gown, or any such ridiculous problem that I have no business with, and don't want to have anything at all to do with. Mr. Murdstone makes a movement of impatience which I have been expecting for a long time. Miss Murdstone does the same. My mother glances submissively at them, shuts the book, and lays it by as an arrear to be worked out when my other tasks are done.

There is a pile of these arrears very soon, and it swells like a rolling snowball. The bigger it gets, the more stupid I get. The case is so hopeless, and I feel that I am wallowing in such a bog of nonsense, that I give up all idea of getting out, and abandon myself to my fate. The despairing way in which my mother and I look at each other, as I blunder on, is truly melancholy. But the greatest effect in these miserable lessons is when my mother (thinking nobody is observing her) tries to give me the cue by the motion of her lips. At that instant, Miss Murdstone, who has been lying in wait for nothing else all along, says in a deep warning voice:

"Clara!"

My mother starts, colors and smiles faintly. Mr. Murdstone comes out of his chair, takes the book, throws it at me or boxes my ears with it, and turns me out of the room by the shoulders.

Even when the lessons are done, the worst is yet to happen, in the shape of an appalling sum. This is invented for me, and delivered to me orally by Mr. Murdstone, and begins, "If I go into a cheesemonger's shop, and buy five thousand double-Glocester cheeses at fourpence-halfpenny each, present payment"—at which I see Miss Murdestone secretly overjoyed. I pore over these cheeses without any result or enlightenment until dinner time, when, having made a Mulatto of myself by getting the dirt of the slate into the pores of my skin, I have a slice of bread to help me out with the cheeses, and am considered in disgrace for the rest of the evening.

It seems to me, at this distance of time, as if my unfortunate studies generally took this course. I could have done very well if I had been without the Murdstones; but the influence of the Murdstones upon me was like the fascination of two snakes on a wretched young girl. Even when I did get through the morning with tolerable credit, there was not much gained but dinner; for Miss Murdstone never could endure to see me untasked, and if I rashly made any show of being unemployed, called my mother's attention to me by saying, "Clara, my dear, there's nothing like work—give your boy an exercise;" which caused me to be clapped down to some new labor there and then. As to any recreation with other children of my age, I had very little of that; for the gloomy theology of the Murdstones made all children out to be a swarm of little vipers (though there was a child once set in the midst of the Disciples) and held that they contaminated one another.

The natural result of this treatment continued, I suppose, for some six months or more, was to make me sullen, dull and dogged. I was not made the less so, by my sense of being more and more shut out and alienated from my mother. I believe I should have been almost stupified but for one circumstance.

It was this. My father had left a small collection of books in a little room upstairs, to which I had access (for it adjoined my own) and which nobody else in our house ever troubled. From that blessed little room Roderick Random, Peregrine Pickle, Humphrey Clinker, Tom Jones, the Vicar of Wakefield, Don Quixote, Gil Blas, and Robinson Cruesoe, came out, a glorious host, to keep me company. They kept alive my fancy and my hope of something beyond that place and time—they, and the Arabian Nights, and the Tales of the Genii—and did me no harm; for whatever harm was in some of them was not there for me; I knew nothing of it. It is astonishing to me now, how I found time, in the midst of my pore. ings and blunderings over heavier themes, to read those books as I did. It is curious to me how I could ever have consoled myself under small troubles (which were great troubles to me), by impersonating my favorite characters in them—as I did—and putting Mr. and Miss Murdstone into all the bad ones—which I did too. I have been Tom Jones (a child's Tom Jones, a harmless creature) for a week together. I have sustained my own idea of Roderick Random for a month at a stretch, I verily believe. I had a greedy relish of a few volumes of Voyages and Travels—I forget what, now—that were on those shelves; and for days and days I can remember to have gone about my region of our house, armed with the centre-piece out of an old set of boot-trees—the perfect realisation of Captain Somebody, of the Royal British Navy, in danger of being beset by savages, and resolved to sell his life at a great price. The Captain never lost his dignity, from having his ears boxed with the Latin Grammar. I did; but the Captain was a Captain and a hero, in despite of all the grammars of all the languages in the world, dead or alive.

This was my only and my constant comfort. When I think of it, the picture rises in my mind, of a summer evening, the boys at play in the churchyard, and I sitting on my bed, reading as if for life. Every barn in the neighborhood, every stone in the church, and every foot of the churchyard, had some association of its own, in my mind, connected with these books, and stood for some locality made famous in them. I have seen Tom Pipes go climbing up the church-steeple, I have watched Strap, with the knapsack on his back, stooping to rest himself upon the wicket-gate; and I know that Commodore Trunnion held that club with Mr. Pickle, in the parlor of our little village alehouse.

The reader now understands, as well as I do, what I was when I came to the point of my youthful history to which I am now coming again.

One morning when I went into the parlor with my books, I found my mother looking anxious, Miss Murdstone looking firm, and Mr. Murdstone binding something round the bottom of a cane—a lithe and limber cane, which he left off binding when I came in, and poised and switched in the air.

"I tell you, Clara," said Mr. Murdstone, "I have often been flogged myself."

"To be sure; of course," said Miss Murdstone.

"Certainly, my dear Jane," faltered my mother, meekly. "But—but do you think it did Edward good?"

"Do you think it did Edward harm, Clara?" asked Mr. Murdstone, gravely.

"That's the point," said his sister.

To this my mother returned, "Certainly, my dear Jane," and said no more.

I felt apurehensive that I was personally interested in this dialogue, and sought Mr. Murdstone's eye as it lighted on mine.

"Now, David," he said—and I saw that cast again as he said it—"you must be far more careful to-day than usual." He gave the cane another poise, and another switch; and having finished his preparation of it, laid it down beside him, with an impressive look, and took up his book.

This was a good freshener to my presence of mind, as a beginning. I felt the words of my lesson slipping off, not one by one, or line by line, but by the entire page; I tried to lay hold of them; but they seemed, if I may so express it, to have put skates on, and to skim from me with a smoothness there was no checking.

We began badly, and went on worse. I had come in, with an idea of distinguishing myself rather, conceiving that I was rather well prepared; but it turned out to be quite a mistake. Book after book was added to the heap of failures, Miss Murdstone being firmly watchful of us all the time. And when we came at last to the five thousand cheeses (canes he made it that day, I remember), my mother burst out crying.

"Clara!" said Miss Murdstone, in her warning voice.

"I am not quite well, my dear Jane, I think," said my mother.

I saw him wink solemnly, at his sister, as he rose and said, taking up the cane:

"Why, Jane, we can hardly expect Clara to bear, with perfect firmness, the worry and torment that David has occasioned her to-day. That would be stoical. Clara is greatly strengthened and improved, but we can hardly expect so much from her. David, you and I will go up-stairs, boy."

...

As he took me out at the door, my mother ran towards us. Miss Murdstone said, "Clara! are you a perfect fool?" and interfered. I saw my mother stop her ears then, and I heard her crying.

He walked me up to my room slowly and gravely—I am certain he had a delight in that formal parade of executing justice—and when we got there, suddenly twisted my head under his arm.

"Mr. Murdstone! Sir!" I cried to him. "Don't Pray don't beat me! I have tried to learn, sir, but I can't learn while you and Miss Murdstone are by. I can't indeed!"

"Can't you, indeed, David?" he said. "We'll try that."

He had my head as in a vise, but I twined round him somehow, and stopped him for a moment, entreating him not to beat me. It was only for a moment that I stopped him, for he cut me heavily an instant afterwards, and in the same instant I caught the hand with which he held me in my mouth, between my teeth, and bit it through. It sets my teeth on edge to think of it.

He beat me then, as if he would have beaten me to death. Above all the noise we made, I heard them running up the stairs, and crying out—I heard my mother crying out—and Peggotty. Then he was gone; and the door was locked outside; and I was lying, fevered and hot, and torn, and sore, and raging in my puny way, upon the floor.

How well I recollect, when I became quiet, what an unnatural stillness seemed to reign through the whole house! How well I remember, when my smart and passion began to cool, how wicked I began to feel.

I sat listening for a long while, but there was not a sound. I crawled up from the floor, and saw my face in the glass, so swollen, red, and ugly that it almost frightened me. My stripes were sore and stiff, and made me cry afresh, when I moved; but they were nothing to the guilt I felt. It lay heavier on my breast than if I had been a most astrocious criminal, I dare say.

It had begun to grow dark, and I had shut the window (I had been lying, for the most part, with my head upon the sill, by turns crying, dozing, and looking listlessly out), when the key was turned, and Miss Murdstone came in with some bread and meat and milk. These she put down on the table without a word, glaring at me the while with ememplary firmness and then retired, locking the door after her.

Successful Lessons in Poultry Raising

Twenty complete Lessons. The successful Poultry Book a simple and comprehensive treatise in the care and culture of domestic fowls. This book is sent free on request.

OCTAVIEN ROLLAND

Sole Agent for the Des Mones Incubator, P. O. Box 2363, Montreal, P. Q.

The Woman's Part.

In the morning to rise early and gladly, and to rouse the spirit as well as the body; to look out first of all at the most beautiful picture framed by her window, even if it be but a glimpse of blue sky between city buildings; to breathe deep, on rainy days to think a moment of the clean leaves and freshened petals: on sunny days to find almost enough joy in the sun alone: to greet such birds as are near the dwelling even if they be only querulous sparrows—this is the housewife's first duty, that she may break the fast of her spirit.

Many other duties close in upon her, cooking and sewing, perhaps, ordering and planning, nursing the sick, caring for those she loves. Her hands must be strong, her fingers deft and nimble. For the hands that labor faithfully lift the whole race and speed us all on our way to God. And a thousand years from now men and women will be a little bit brighter and braver for this her present toil. But the hands that will not cleanse or repair or fashion clutch at the feet of the Race and hold us all back.

Many duties press in upon her, but perhaps one more than all others: perhaps there is for her one labor of heart and mind unique and beautiful. Perhaps for this one thing she was born of her mother. If this be so, then for this task all lesser tasks should wait. When God who lives in her says, ""This do and thou shalt live!" she may not answer that there are other demands. For efficient service is not blind slavery, and blind slavery is not the highest service. Let her heed her individual nature.

Her body may be confined within the four walls of her dwelling, but her spirit should have liberty to reach out into the Universal. Her pantry shelf may be poorly furnished, but her heart she must nourish at all costs. Her house should be swept and and garnished, but it profits her little to have a clean house with a cobwebby mind. Order and Serinity should reign in her chambers, but they will not avail for her happiness unless they reign in her life.

To have in the home some beauty so persuasive, so adhesive and concentrated that when she goes out she carries it with her unconsciously—to be able to bring it from every brief excursion a sweet new power, a subtle joy, a chance of benison, to hold the doors of the home wide open alike for guests who can bring love and for guests who can receive it: with the setting of the sun to give herself over to gaiety with those who are her dearest ones this is the breaking of the bread to which the house-keeper is called.

Then, let the oak trees cast long shadows under the moon and stars while she lies resting, for the love that broods about her will whisper that she has lived one day well.—Woman's World.

Cold Tomato Catsup.

Peel and chop very fine one-half peck ripe tomatoes.

Drain in colander, put into an earthern vessel and add'

One-half cup grated horse radish.

One cup salt.

One cup black and white mustard seed, mixed.

Two pounds black pepper.

Two red peppers and two roots celery chopped fine.

One cup brown sugar.

One cup nasturtium seeds, chopped fine.

Two pounds ground cloves.

Two pounds allspice.

One teaspoon cinnamon.

One teaspoon mace.

One quart cider vinegar.

Mix all well, bottle and seal.

Many a man has been patted on the back so much that it has stunted his growth.

Free to Stock and Poultry Raisers

We will send absolutely free, for the asking, postpaid, one of our large sixty-four page books, with insert, on the common diseases of stock and poultry. Tells how to feed all kinds of heavy and light horses, colts and mares, milch cows, calves and fattening steers; also, how to keep and feed poultry so that they will lay as well in winter as summer. No farmer should be without it.

NOW is the time to use Royal Purple Stock Specific. At a cost of only two-thirds of a cent per day per animal, it will increase it 25 per cent. in value. It permanently cured Bots, Colic, Worms, Skin Diseases and Debility. Restores run-down animals to plumpness and vigor. It will increase the milk yield three to five pounds per cow per day and make the milk richer.

Royal Purple is not a stock food. There is no filler used in its manufacture, and we import from Europe all the seeds, herbs, barks, etc., and grind them on our own premises. Therefore, we can guarantee it to you as being absolutely pure. We do not use cheap filler to make up a large package. We give you the best condition powder ever put on the market in a concentrated form.

A tablespoon levelled off, once a day, is sufficient for a full-grown animal. It prvents disease, keeps your animals in perfect health, and is absolutely harmless. It makes six-weeks-old calves as large as ordinary calves at ten weeks. You can develop six pigs ready for market in just one month's less time than you can possibly do without it, at a cost of only $1.50, saving you a month's work and food.

A 50c. package will last a horse 70 days. A $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last an animal 280 days.

If you have never used it, try it on the poorest animal you have on your place, and watch results. If it does not produce better results than anything you have ever used, or give you satisfaction, we will refund your money.

Toledo, Ont., July 1, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—I have used a part of a package of your "Royal Purple Stock Specific." I fed it to one cow according to directions. She gained six pounds of milk while using part of a package. The rest of my herd reduced in milk while this one gained. I consider it has no equal.

T. G. BELLAMY.

Bondhead, Ont., Aug. 31, 1912.

The W. A. Jenkins Mfg. Co., London, Ont.

Gentlemen,—After experimenting with a great many stock foods, I was about convinced that there was very little virtue in any of it, but your dealer insisted on me trying Royal Purple Stock Specific, saying it was different from all others. I have since used a great lot of it, as I keep from ten to twenty horses and about the same of cattle. This Specific, in my opinion, is certainly in a class by itself as a conditioner, and is the best I have ever used.

GEORGE MAPES.

Clear Creek, Ont., Sept. 19, 1912.

W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Your "Royal Purple" Stock Specific is the best stock conditioner I have ever had in my stables, and am never without it. I had a brood sow that had milk fever very bad. Your "Royal Purple" saved her life. Put her on her feet in three days. I had three calves last spring that got scouring very badly. Could not get it stopped until I used "Royal Purple." It did the work O.K.

Yours truly, H. B. MOULTON.

Saskatoon, Sask., Sept. 20th.

The W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—Some months ago we bought some of your Royal Purple Stock Specific from Mr. Vogan here. We have been using it ever since, and we find it the best conditioner for driving horses we have ever tried.

H. F. McCALLUM, "The Palace Livery."

Scott, Sask., May 22nd, 1911.

The W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Do you want a man to represent your Royal Purple goods in this district. I am from Ontario, and have fed your Stock Specific—got it from Mr. J. Corbett, of Brownsville. My cows, while us ng it, made the largest average, and tested five points over average at C.M.P. at Brownsville. I know your goods are the highest class Stock Specific on the market, and take great pleasure in representing you in this district

NORMAN G. CHARLTON.

Royal Purple Poultry Specific

will make your hens lay in winter, as well as summer, and yet a 50c. package will last 25 hens 70 days, or a $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last 280 days. It prevents poultry from losing flesh at moulting time, cures and prevents all the ordinary diseases, makes their plumage bright, and keeps them in prime condition.

Port Colborne, May 11.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—This is to certify that I have used one $1.50 tin of your "Royal Purple" Poultry Specific, and there is nothing that can equal it. I wanted yours again and your agent did not have any, so he gave me another brand, and I can assure you it was not worth carrying home, for my hens layed better without it. I have been from 12 to 15 dozen eggs short every week since I have not used your "Royal Purple."

CHARLES RICHARDSON.

Royal Purple

STOCK AND POULTRY SPECIFICS

A second from Mr. Richardson as follows :—

Port Colbborne, Ont., Aug. 24, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—Please find enclosed express order for $3.00, for which please send me two tins of your "Royal Purple" Poultry Specific.

C. RICHARDSON.

A third letter from Mr. Richardson as follows :—

Port Colborne, Ont., Aug. 29, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I received two tins of "Royal Purple" Poultry Specific all O.K. I have tried all kinds of specific to make my hens lay, and I find that you are the only ones that manufacture the genuine article. All the rest, I think, is a waste of time and money to bother with. As an egg-producer, I cannot praise your Poultry Specific high enough, for I would not be without it if I had to pay double the money.

C. RICHARDSON.

Sherbrooke, Que., Aug. 1, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I have used your Specific for one year, and have given it to my birds with good results. See my winnings at the different fairs, which will tell the tale.

MISS GEORGINA CAMIRAUD.

Royal Purple Cough Specific

During the last four years there has been an epidemic cough going through every stable in Canada, which has been a great source of annoyance to horsemen. Our Royal Purple Cough Cure will absolutely cure this cough in four days, will break up and cure distemper in ten days. Absolutely guaranteed. 50c. per tin; by mail, 55c.

Royal Purple Gall Cure

will cure all sorts of open sores on man or beast. Will absolutely dry up and cure scratches in a very few days.

MR. SAM OWEN, coachman for the Hon. Adam Beck, says: "By following directions, I find your Royal Purple Gall Cure will cure scratches and make the scabs peel off perfectly dry in about four or five days." Price, 25c.; by mail, 30c.

Royal Purple Sweat Liniment

will reduce lameness in a very short time. Mr. John M. Daly, coalman in London, says: "We have nine horses constantly teaming coal, and have all kinds of trouble with them being lame at times. I have used your Sweat Liniment for a year back, and have never known it to fail to cure sprained tendons, etc." Price, 50c., 8-ounce bottles; by mail, 60c.

Royal Purple Lice Killer

This is entirely different from any lice killer on the market. In order for you to understand the process of manufacture of this lice killer, you will have to send for one of our booklets, as we give you a full history of it there. It will entirely exterminate lice on fowls or animals with not more than one or two applications. It smothers them. Price 25c.; by mail, 30c.

Royal Purple Disinfectant (Sheep Dip)

In this line we give you the largest value for the money of any disinfectant on the market. A tin containing 1 3-8 qts. Imperial measure will cost you only 50c. Also put up in 25c. tins.

Royal Purple Roup Cure

Mr. Dulmage, the great breeder, of White Rocks, tells us that he has never used a Roup Cure that will give relief so quickly to hens suffering from Roup or kindred diseases. Our book tells you all about it. 25c. per tin; 30c. by mail.

Royal Purple Worm Powders

For animals. 25c. per tin; by mail, 30c.

In using our Stock Specific, we guarantee you better results by using the ordinary food grown on your farm, such as good hay, oats and bran, and so forth, than you can possibly obtain by using any of the many patent foods on the market. In these the percentage of nutrition is usually very small for the amount of money paid for the same. You know exactly what hay, oats, bran, chop or any farm products cost you, and ROYAL PURPLE makes animals digest these foods properly.

What we wish to impress on your mind is that we manufacture nothing but pure, unadulterated goods. Our booklet gives over 300 recommendations for our different lines from people all over Canada. While we give you above the names of a few who have used it, our best recommendation is for you to ask any person who has ever used any line we manufacture.

These goods may be obtained from Halifax Seed Co., Halifax; Amherst Trading Co., Amherst; A. Horne & Co., Charlottetown; Maynes & Riley, St. John.

W. A. JENKINS MANFG. CO., London, Ont.

AN ASSORTED ORDER AMOUNTING TO $5.00 WE WILL PREPAY.

Distribution of Seed Grain and Potatoes

By instructions of the Hon. Minister of Agriculture a distribution of superior sorts of grain and potatoes will be made during the coming winter and spring to Canadian farmers. The samples for general distribution will consist of spring wheat (5 lbs.), white oats (4 lbs.), and field peas (5 lbs.). These will be sent out from Ottawa. A distribution of potatoes (in 3 lb. samples) will be carried on from several of the experimental farms, the Central Farm at Ottawa supplying only the provinces of Ontario and Quebec. All samples will be sent free, by mail.

Applicants must give particulars in regard to the soil on their farms, and some account of their experience with such kinds of grain (or potatoes) as they have grown, so that a promising sort for their conditions may be selected.

Each application must be separate and must be signed by the applicant. Only one sample of grain and one of potatoes can be sent to each farm. Applications on any kind of printed form cannot be accepted. If two or more samples are asked for in the same letter only one will be sent.

As the supply of seed is limited, farmers are advised to apply early; but the applications will not necessarily be filled in the exact order in which they are received. Preference will always be given to the most thoughtful and explicit requests. Applications received after the end of January will probably be too late.

All applications for grain (and applications from the provinces of Ontario and Quebec for potatoes) should be addressed to the Dominion Cerealist, Central Experimental Farm, Ottawa. Such applications require no postage. If otherwise addressed delay and disappointment may occur.

Applications, for potatoes, from farmers in any other province should be addressed (postage prepaid) to the Superintendent of the nearest Branch Experimental Farm in that province.

J. H. GRISDALE,
Director, Dominion Experimental Farms.

Larger Freight Shipments via I. C. R.

Nova Scotia apples of the finest grades are not all being shipped to English markets. During the past two years the products of the Nova Scotia orchards have been shipped to the Northwest where they bring a higher price than any competing fruit on account of a superiority in flavor.

This year the shipments to the West have practically quadrupled owing to the energy of the Freight Department of the Intercolonial Railway which, seeing great opportunities in the apple shipments, set about to develop the Western movement. Next year this business promises to be very large as the dealers are finding a profitable market in the West.

Apples grown in the Maritime Provinces have a distinctive flavor from the fruit grown inland and this is largely responsible for the demand.

The freight business of the Intercolonial is increasing wonderfully, the total tonnage carried this year being far in excess of all previous records. Large quantities of fresh and cured fish are being shipped to Montreal and Toronto from Mulgrave, a feature being the great quantities of finnan haddies which are being rushed through in refrigerator cars.

Large shipments of gypsum are also being made and lumber is moving in larger quantities during the winter months.

MODERN SANITARY CONVENIENCE ON THE FARM

The "Good Health Sanitary Chemical Closet is a modern Sanitary Convenience constructed particularly for families who live in a district where it is impossible to have waterworks or sewerage; a sanitary closet that can be placed in your home, store, school, hotel or public buildings; a closet that is made right by overcoming each and every objectionable feature found in other so-called "Sanitary-Closets." There is no burning to do. The "Good Health" Closet is 17 inches high; 17 inches wide; 24 inches long. It is manufactured from best English Sheet Steel, is polished brass and nickle plated fittings; all wooden parts being hard birch highly polished with mahogany finish. Costs from $1.00 to $2.00 per year for maintenance and from 50c to $1.00 to install according to range of pipe.

PRESERVE LIFE BY DESTROYING THE GERMS WHICH CAUSE DEATH

It is a well known fact that millions of germs are directly traceable to outhouses. Are you going to allow that horrible pest to remain within a short distance of your home? Are you going to make it necessary for your family to use it—It is unnecessary for us to illustrate the faults and evils of this abominable nuisance.

DON'T LOCK THE DOOR AFTER THE HORSE IS STOLEN

Install a "Good Health" Sanitary Chemical Closet in your home NOW. Your family will appreciate its privacy and convenience.

A POSTAL WILL BRING FULL PARTICULARS

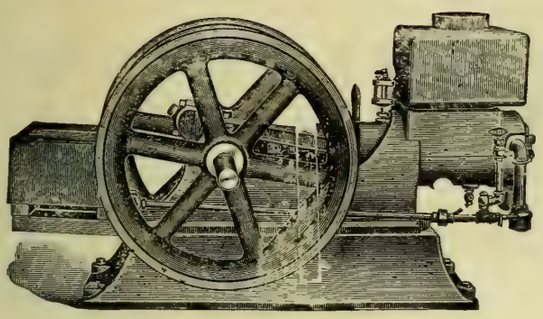
The Gasoline Engine Trade Is Yours

If you handle the Sussex Motor Co's. Waterloo Boy



The advantages of handling the Motor Co.'s engines are these: When you handle this engine, you have working for you the tremendous business-getting power of the Highest Quality and the Underselling price, the benefit of a great advertising and selling plan that reaches out and brings the buyer right into your place of business and and in addition to all these advantages, you now have the greatest sales clincher an engine ever had—absolute convincing proof that it is the best in the world—the winning of the first prize in the World's Competition.

Your customers really want the best. They will pay more money for a thing, if you can convince them that it is cheapest in the long run. With the Waterloo Boy you have absolute proof that your engine is the best and in addition you can name a reasonable price. Can you see where your competitors have any chance at all against this combination?

There is no two ways about it, the Waterloo Boy "simply has the other fellow's goat." It is the best engine in the world and the farmers know it. It has the most exclusive advantages, develops the most power for it's size and weight, is the easiest managed and cheapest to run, most widely advertised and farmers buy more of them than any other kind on the market.

Now, there are more Waterloo Boys sold than any other, and it stands to reason that each Waterloo dealer will sell more than his competitor and that you can sell more engines and make more money handling the Waterloo Boy than any other on the market.

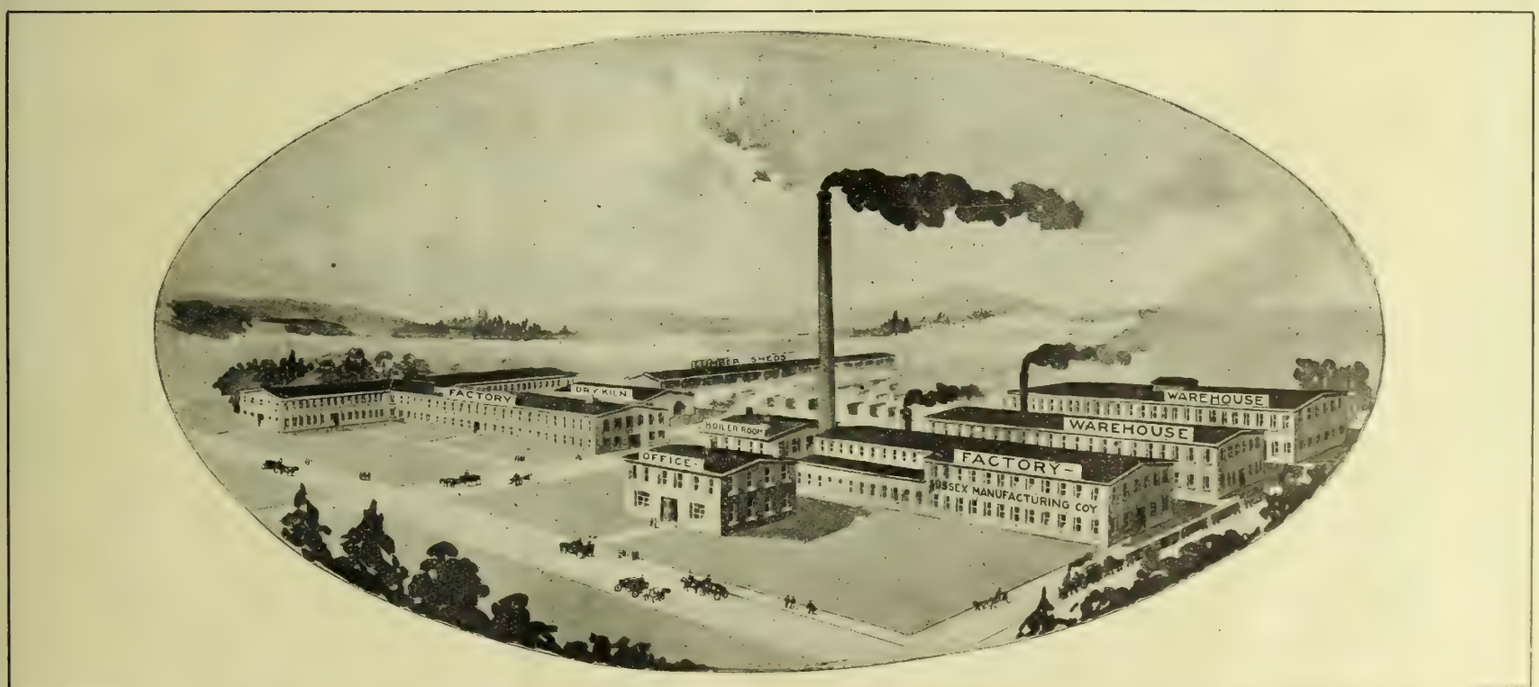
The Sussex Motor Co., Limited, Sussex, N. B.



Why Should Maritime Province Farmers

buy products made by a Maritime Province concern such as the Sussex Mfg. Co., of Sussex, N. B.? Because they are made of material grown and mined in the Maritime Provinces. Our company has in the vicinity of one hundred men in its employ who buy goods produced by the farmers in the Maritime Provinces. We with other manufacturing concerns in the Maritime Provinces furnish our farmers with their market. They are the people who are the backbone of development in this Province. They along with other employees of the Maritime Provinces, constitute our towns and villages, thus creating a larger demand for products grown on the farm. By buying machines from this concern, you are not only helping to build up our industry but you are helping build up your own farms. If our goods were not as good or superior to other makes we would not solicit your patronage in this way.

If you require any of the following lines, let us send you description and quote prices on: Threshers, Wood Cutters, Hay Presses, Grain Grinders, Root Pulpers, Garden Seeders, Castings, Farmer's Feed Boilers, Refrigerators, House Finish, Church Furniture, etc.

PATRONIZE YOUR OWN LINE

What more Appropriate Gift for Christmas than a Year's Subscription to

The Canadian Countryman

a magazine conveying the thought of leading Canadian citizens and publicists on subjects educational, Political, Economic and Civic ?

People who are reading The Canadian Countryman and who are interested in it:

Farmers
Land-Owners
Market Gardeners
Fruit Growers
Merchants
Bankers
Students of Agriculture
Tradesmen
City Folks Interested in Agriculture
The Country Woman
School Teachers
Lawyers
Doctors
Veterinary Surgeons

The anadian Countryman views agriculture as both an industry and a trade—the fundamental industry of the country upon which the prosperity of the nation depends. The Canadian Countryman is practical and broad-guaged. It takes the reader away from his own neighborhood; brings to him the success of others interested in agriculture in other places; brings to him new ideas; increases his learning, his productiveness and his earnings.

Sixty per cent. of the population of Canada are directly interested in agriculture. Ninety per cent. are wholly dependent on its progress. Every person is more or less associated with this, Canada's greatest industry.

All the great interests of Canadians everywhere are Common. But they are great--and should be better understood.

To giving the ***facts*** about Canada to Canadians, so that our rapidly increasing population will be the ***right sort*** of Canadians, ***The Canadian Countryman*** is dedicated.

Over a thousand dollars are being spent every week in getting and printing up-to-the-minute information and advice on the conditions of cultivation, of marketing, in farm management, in government agricultural policies, in rural life. The great economic problems of Canada and the Empire will be discussed by the best writers.

To send a year's subscription to The Canadian Countryman as a Christmas present would be like sending fifty-two different presents throughout the year, for the recipient will be receiving every week a Magazine brimful of practical articles on poultry, live stock, road building, the dairy, farm machinery, the church, the rural school, the grange, farmer's clubs and other aspects of country community life; co-operative marketing; building and furnishing the house; fire insurance on farm buildings; a regular department on the scientific advance of agriculture and new inventions; wholesome fiction and verse; and a strong editorial page that ***stands always for the interests of Canadian Citizenship.***

If you are wondering what gift will be most acceptable to friends and if you want to avoid the rush and crowds at Christmas, let this suggestion solve your difficulties. The Canadian Countryman has prepared a beautiful Christmas card which will carry the name of the person who orders the subscription and which will be mailed in time to be received on Christmas Day by each person for whom a subscription is ordered. This way of announcing the gift adds greatly to its attractiveness.

Give your own name and address as well as the name and address of the recipient when you remit, and clearly state that it is intended as a Christmas Gift. Order now, sending $1.00 for each subscription ($1.50 in the United States). By sending promptly, any possible delay will be avoided, but the announcement will be held and mailed so as to be received on December 25th, while the subscription will be started with our Christmas number.

M. H. PARLEE, Lower Millstream, N. B.

Natural Gas Lighting on I. C. R. Cars.

Something novel is being introduced by the Intercolonial Railway in connection with the lighting of their cars. Recent experiments with the natural gas from the Albert County wells which is now being extensively used in Moncton, demonstrated that not only could the gas be used successfully on the cars, but that the capacity for compression was much greater and their cost per car much less. It was proved also that the natural gas mixed satisfactorily with the Pintch gas, thus overcoming any difficulty of renewing the supply where the natural gas is not available. The Intercolonial is probably the first railway in America to use natural gas for car lighting.

When you have a bilious attack give Chamberlain's Tablets a trial. They are excellent. For sale by all dealers.

If you are troubled with chronic constipation, the mild and gentle effect of Chamberlainjs Tablets makes them especially suited to your case. For sale by all dealers.

Diversified Farming on a N. S. Fruit Belt Farm.

(Continued from page 161.)

As a valuable means of disposing of the by-products of the dairy and the farm, the O'Briens keep a few pure bred Yorkshires and plan to always have a bunch fattening for market.

In the poultry line, White Wyandotte aad Buff Orpington hens give a full egg basket, enough for home use and a lot to spare for the market. Tolouse geese and Bronze turkeys are also kept on the O'Brien farm. A fine pair of Tolouse geese have recently been purchased at a big figure from one of the foremost Ontario breeders. The poultry pick up a lot of grain and seeds around the farm that would otherwise go to waste.

The O'Briens practice the following rotation of crops:—First year grain to rot the sods and prepare the land for easy tillage during the second year when roots are grown. During the third year the ground is devoted to another crop of oats, barley or mixed grains seeded with timothy and clover. The fourth crop is hay and the fifth year another crop of hay is cut or the land may be devoted to pasturing purposes.

They plan to do as much fall plowing as possible so that the seeding operations may start at the very earliest date possible in the spring. Large quantities of barnyard manure are broadcasted at the rate of 25 loads per acre on the fields intended for roots and worked in by cross plowing and thorough discing. They use a Scotch turnip seeder that sows commercial fertilizers, to give the roots a good start, and also sows the seeds at one operation.

The turnips are thinned to fifteen inches apart as soon as they show pretty well in the row. The cultivator is kept busy throughout the growing season to conserve the moisture and to keep the soil free from weeds.

The O'Briens also grow several hundred barrels of potatoes for the local market. In some seasons they ship carloads to distant markets.

The O'Briens ideas of carrying on a system of mixed farming is sound. They have tried and succeeded. Theirs is no blue ruin story in years when any particular crop fails for they have the other branches of their operations to help them along. Their motto is "We grow as much of everything as we can."

Mr. O'Brien is well versed in the various public questions of the day. He was one of the founders of the Nova Scotia Farmers' Association and seldom fails to be present at the annual deliberations. He brings a clear mind and ready judgment to bear on the various perplexing questions with which the Farmers' Parliament is confronted. He has given his boys and girls, now grown to manhood and womanhood, the benefits of a good education, and in their every day life each and every one of them are like their parents, the very essence of good industrious citizens. It is a pleasure to meet Mr. O'Brien and his sons in their own home, or anywhere for that matter. They all seem to enjoy each other's confidences and make up one ideal, happy family.

Although some of the boys have settled on farms of their own, they all work together as suits best and in this way they are a powerful example of the old adage "In unity there is strength."

Jewelry stores get immense price for jewelry not as fine as jewelry contained in this set.

READ HOW TO OBTAIN THESE HANDSOME PRESENTS ABSOLUTELY FREE

We are the makers of the famous **NEW LIFE VEGETABLE PILLS**, the grand tonic and blood maker, which have proved a boon to thousands of ailing persons, and their remarkable tonic and nerve and blood-making properties make them in great demand all over Canada and United States and this great demand has been supplied solely by our agents, who are winning thousands of dollars' worth of our elegant presents.

Instead of placing our grand remedy in the hands of jobbers and druggists, we prefer to place them in the hands of worthy persons who are constantly coming in contact with the sick and ailing, to whom **NEW LIFE VEGETABLE PILLS** prove a blessing. Therefore, to every lady who will send us her name and address and agree to sell only 10 boxes of the famous New Life Vegetable Pills at 25 cts. a box we will give, absolutely free, the lovely box of 5 handsome presents.

All we ask of you is to send us your name and address and we will send you only 10 boxes and trust you with them until sold. As soon as you have sold them, return us only $2.50 and we will immediately ship you the 5 handsome presents. We arrange to pay the carriage charges.

Act at once. Don't delay. There are thousands of sick and ailing who need such grand medicine as **NEW LIFE VEGETABLE PILLS** and by supplying this great demand you can have the 5 handsomest presents ever offered. Send your name and address to-day to:

THE NEW LIFE REMEDY CO. Dept. J. 1352 **TORONTO, ONT.**

Cobequid Farm Holsteins

We offer for sale 9 bulls from 2 months to 18 months old. The dams of these bulls averaged 12,358 lbs. milk in one year. including 3 two yrs old and 2 three yrs old. Do you know where you can beat this average in the Maritime Provinces? There is need for a thousand bulls such as these. For particulars and prices address

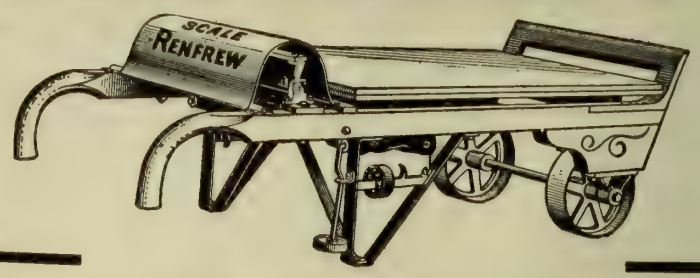
"WHEEL THE SCALE TO WHAT YOU WANT TO WEIGH"



THE "RENFREW" HANDY TWO WHEEL TRUCK SCALE

SAVES MONEY FOR FARMERS AND DAIRYMEN

Thousands of farmers are losing money yearly through the inaccuracy of their scales.

It was to protect the farmers against these losses that the Renfrew Truck Scale was designed and built.

And it does protect them,--by being absolutely accurate.

Gives the farmer all his profits on everything he sells by weight.

Saves for him time and labor,--simply wheel the scale to what you want to weigh.

Weighs everything from one pound to 2000 lbs,--and weighs it right. To verify these statements:

MAIL THIS COUPON NOW FOR FREE BOOKLET

"The Profit in The Last Ounce."—It tells in an interesting way the business side of farming, and how money is saved with a "RENFREW" Handy Two-Wheel Truck Scale.

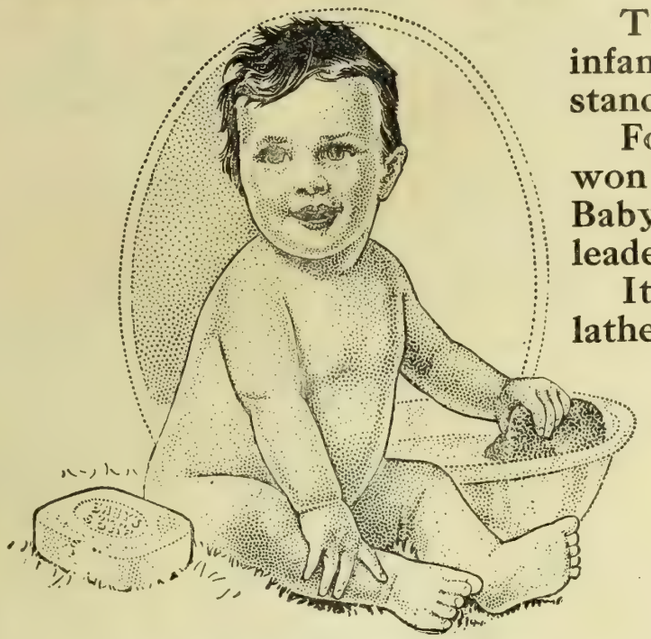
BABY'S OWN SOAP



To help the tender skin of an infant is the Baby's Own Soap standard.

For four generations, it has won unstinted praise and today Baby's Own is the recognized leader for nursery and toilet.

Its pure, creamy, fragrant lather softens and heals, and its daily use is a renewed delight.

It's Best for Baby and Best for You.

Sold almost everywhere—but insist on Baby's Own.

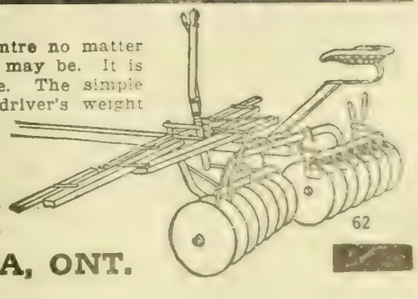
Compare the "BISSELL" with other disks

Thousands of Canadian Farmers have tested the "Bissell" Disk Harrow in the same field with other makes and found that the "Bissell" HAS THE GREATEST CAPACITY.

The plates on the "Bissell" Harrow are the correct shape. They cut, turn and pulverize the soil where others only scrape the ground and set it on edge. The "Bissell" does clean work where others make a poor job of it.

The "Bissell" Scrapers meet the plates chisel fashion and keep the plates clean. Movable Clod Irons—an exclusive feature — keep the space between the plates clear.

The "Bissell" stays RIGHT DOWN TO ITS WORK. It won't bind, buckle or hump in the centre no matter how stiff or hard the soil may be. It is built to stand hard usage. The simple method of balancing the driver's weight removes neck weight. It is the Harrow you should know more about.



Write to Dept. M for catalogue with description.

T. E. BISSELL CO., LTD., ELORA, ONT.

FELL AWAY TO A SHADOW.

All Her People Thought She Had

CONSUMPTION.

Mrs. Wm. Martin, Lower Ship Harbor East, N.S., writes:—"I am sending you a testimonial of my cure by Dr. Wood's Norway Pine Syrup. Last May I took a cold, and it settled on my lungs. I got so bad I could not rest at night. I had two doctors to treat me but got no relief.

"All of my people thought I had Consumption. I had fallen away to a shadow. I had given up all hopes of ever getting better again until my daughter went to a store one day and bought me a bottle of Dr. Wood's Norway Pine Syrup. After taking half of it I felt better, so I got two more, and thanks to them I am well to-day, and able to do my house work. I cannot say too much in its praise, and I shall always keep it in the house."

Dr. Wood's Norway Pine Syrup contains all the lung healing virtues of the famous Norway Pine tree which makes it the very best preparation for Coughs, Colds and all Throat and Lung Troubles.

See that you get "Dr. Wood's" when you ask for it. There are many imitations on the market.

Price, 25 and 50 cents.

See that the name, The T. Milburn Co., Limited, is on the yellow wrapper.

WILL GIVE $500 TO SICK READERS OF MARITIME FARMER

Famous Scientist Who Originated the Now Wonderful "Home Treatment" Offers $1.00 Package Free to Sick and Ailing.

In order that every reader of Maritime Farmer who may not have heard of this wonderful "Home Treatment" may have an opportunity to test this celebrated medicine, the now famous scientist, Dr. James W. Kidd, offers to give absolutely free a full size $1.00 package to five hundred readers of this paper, to prove the wonderful claims which have been made for it. In making this offer the scientist said: "I know that there are many people who have been suffering for years with some chronic disease and many of them have spent large sums of money seeking a cure. I know that these people hesitate about investing money in medicine because they have despaired of ever getting well. Thousands have told me that story and many thousands of the same people have told me afterwards that my treatment had cured them after doctors and everything else had failed. I want to prove to a limited number—no matter what the disease, no matter how long they may have suffered no matter how blue and discouraged—that my treatment really and actually does accomplish the wonderful results that have been reported."

People who suffer from Rheumatism, Kidney Trouble, Stomach Trouble, Liver or Bowel Disorders, Catarrh, Bronchitis, Asthma, Chronic Coughs, Weak Lungs, Lumbago, Piles, Urinary Disorders, Female Weaknesses of any kind, the weak, worn out, broken-down and despondent will be delighted at the effect of a few doses. This wonderful treatment creates a fine appetite and helps the digestive organs to carry on their functions as they should. It strengthens the kidneys, too, and drives rheumatism poisons from the blood as if by magic. That is why people who try it become so enthusiastic.

Any reader of Maritime Farmer who will try this extraordinary medicine that has created so much excitement by its cures can obtain absolutely free a full $1.00 treatment by simply filling in the coupon below or writing a letter describing their case in their own words, if they prefer, and mailing it today to James W. Kidd, Toronto, Canada. No money need be sent and no charge of any kind will be made.

As this offer is limited, you should write at once, in order to be sure to receive your free treatment.

Coupon CB-260 For Free Dollar Treatment

Handsome doll and carriage and set of real China dishes for dolly and you

Girls—we want to give you **absolutely free** this handsome doll and beautiful carriage with blued steel wheels, and set of the most beautiful china dishes you ever saw. Dolly is tall, graceful and most lifelike, with handsome gown, and has long, curly hair and handsome hat. You can move her hands and feet. She stands nearly half a yard tall. The lovely carriage we give you with the doll is made of finely interwoven wicker, mounted on steel wheels and axles. Just the beautiful carriage you want for the loveliest doll you can get. The set of dishes is big enough for you and your doll to hold a five o'clock tea, and it is genuine china, handsomely decorated. The teapot holds two large cups of tea; you will be delighted with it. Think, girls!—You can have these three elegant presents **absolutely free.**

Free

Send us your name and address at once and agree to sell only 25 bottles of our delicious, fast selling, oriental perfume at only 10 cents per bottle. They come in six delicious odors—rose, carnation, lily of the valley, heliotrope, violet and lilac. Our perfumes are so good and sweet, and so handsomely put up that they sell like lightning.

You will have no trouble at all to dispose of only 25 bottles. When sold, send us the money, only $2.50, and we will promptly ship you the doll, carriage and the beautiful tea set exactly as represented. **Don't delay, we are giving handsome extra presents for promptness. Address:**

Big Values for Xmas

Christmas is the time to encourage young musicians. A Musical family is a Happy family.

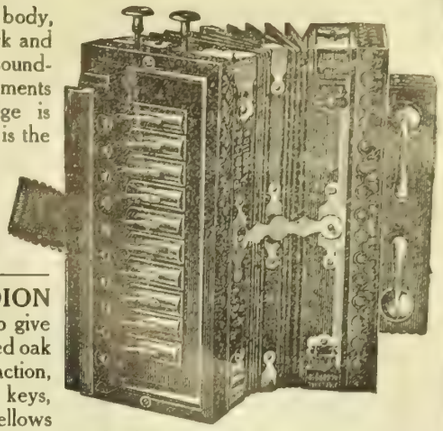
Look at the lovely **MANDOLIN** Santa is bringing to some fortunate boy or girl! A splendid instrument. 18 ribs finished in mahogany with strips of black wood between. Top of spruce inlaid with purfling round the edge and sound-hole; bound with white celluloid. The neck is hardwood — mahogany finished, rosewood finger-board, inlaid with pearl; position dots.

A rich, mellow-toned instrument. Our special price for this delightful Mandolin is only **$4.00.** Others up to $90.00.

At these prices our stock of "Specials" will not last long. No present is more appreciated than a good musical instrument. We will send in time for Christmas if ordered early.

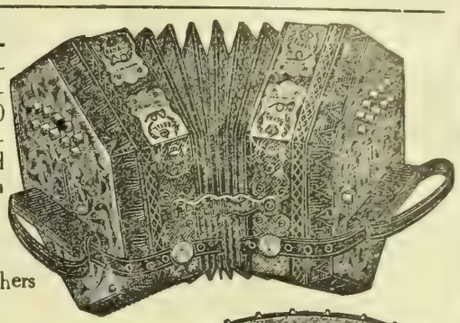
Gladden your Christmas with Music

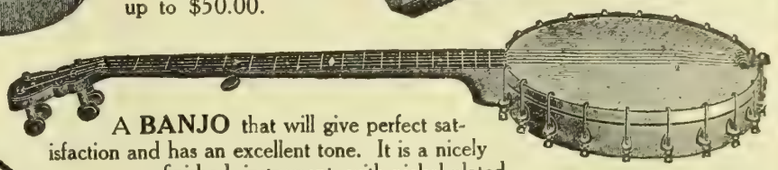
This **GUITAR** has a maple body, finished in a beautiful rich dark and light colored spruce top. The sound-hole is inlaid with fancy ornaments of jet and pearl. The bridge is finely scrolled and ebonized, as is the finger-board. It also has brass patent heads. Perfect in tone and workmanship. Our special price, **$3.75.** Others up to $85.00.



A very good **ACCORDION** of German make, guaranteed to give perfect satisfaction. Nicely finished oak case and mouldings, open action, nickel keys, 6 fold bellows, 10 keys, 2 stops, 2 sets of reeds. Bellows box neatly finished in dark wine color leatherette and gilt edged, nickel corner-protectors. Our special price, **$3.25** (including instruction book). Others up to $50.00.

An exceptional **CONCERTINA,** well constructed and with an excellent tone. It has 20 keys, imitation rosewood case, 8-fold fancy bellows, German silver sound-holes. Our special price (including instruction book), **$2.75.** Others up to $50.00.





A **BANJO** that will give perfect satisfaction and has an excellent tone. It is a nicely finished instrument with nickel-plated band on wood shell, six nickel-plated, good quality hexagon brackets, with hooks, finger-board with raised frets and position dots, and good quality calfskin head. A very desirable instrument for a beginner. Our special price, **$3.50.** Others up to $75.00.

Bargain upon Bargain is to be found in our book "MUSICAL TREASURES." It is a book of special interest to all lovers of music—containing a great amount of musical information. It is a handy shopping guide too. Send for your copy to-day. It is free.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

Fitting the Harness.

The importance of this operation is easily seen when one stops to think that no two horses have the same conformation and that as far as little peculiarities go they are as diffenent as people. Jones and Smith may wear shoes of the same size but if after each has worn a pair a month, they happen to get them mixed up, there are two men who are most uncomfortable until they get their their own shoes. The same is true of horses. The collar, and the rest of the harness should fit the horse in order that you may get the maximum amount of service.

Perhaps, on account of the general prevalence of sore shoulders and similar troubles, the fitting of the collar is the most important single operation in getting the harness to set well. The fleshing of the shoulders must be taken into consideration. If they are especially thick, the use of a sweeny collar helps a great deal. Collars that are snug and rather long have a tendency to draw up and down with serious consequences, while a short collar frequently causes more or less choking and often brings sores on the neck. Soaking the face of a new collar in water is a practice that is often recommended as it enables the collar to conform to the shape of the horse's neck. Sweat pads should be used with discretion and when used should be given especial care.

It is important that the hames conform to the collar. How often we see hames hanging loose sometimes causing all the strain to be on the outside of the collar. The point of the heaviest draft should come to a point about one-third of the distance upward from the point of the shoulder. If this point of draft is too low, it often results in severe bruises at the point of the shoulders. A parting injunction in regard to the hames is to always keep the upper strap buckled tight.

Carelessness often results in the traces being of unequal length resulting in an excessive strain on one side of the shoulder. The short hitch is always to be preferred as it keeps the horse closer to the vehicle and the driver while on the other hand the long hitch gains little or no extra power. Too frequently, we see the back pads any place between the croup and the withers. They should be in the depression just back of the withers and keeping them there results in a better looking turnout as well as keeps the harness in better condition. In a great deal of farm work, breeching is entirely unnecessary, but when used they should be properly placed. It is important that the traces draw in a straight line.

The Horses' Teeth.

Any farmer of good judgment can be taught to float the sharp points horses' teeth, but any of us can be shown in a few minutes how to accomplish something that we could not learn in days from what any man can write on the subject. Of course, horse dentistry cannot be taught in a few minutes, but the floating off the sharp points of a horse's teeth can. The first lesson that needs teaching is that the upper jaw of a horse is much wider than the lower jaw, and when the mouth is closed the teeth do not set squarely together. The teeth on the lower jaw set only on the inner part of the teeth of the upper jaw. Lesson No. 2 is that when a horse masticates his food he doesn't do it by simply shutting his teeth down on the food. He gets the mouthful of food on his tongue, which he uses to carry the food between the teeth, and the lower jaw works sideways enough to grind the lower teeth on the up-

Water Troughs Galvanized Steel

REPLACE INSANITARY AND DISEASE-BREEDING WOODEN-TROUGHS WITH CLEAN AND RUST-PROOF STEEL TROUGHS. These are made of heavy galvanised steel, thoroughly riveted and heavy soldered so that they cannot leak, and finished on the outside with aluminum. We will send you one on free trial, if not satisfactory return it. Prices are reasonable, ranging from $7.50 to $20.00 according to size. Send for illustrated folder.

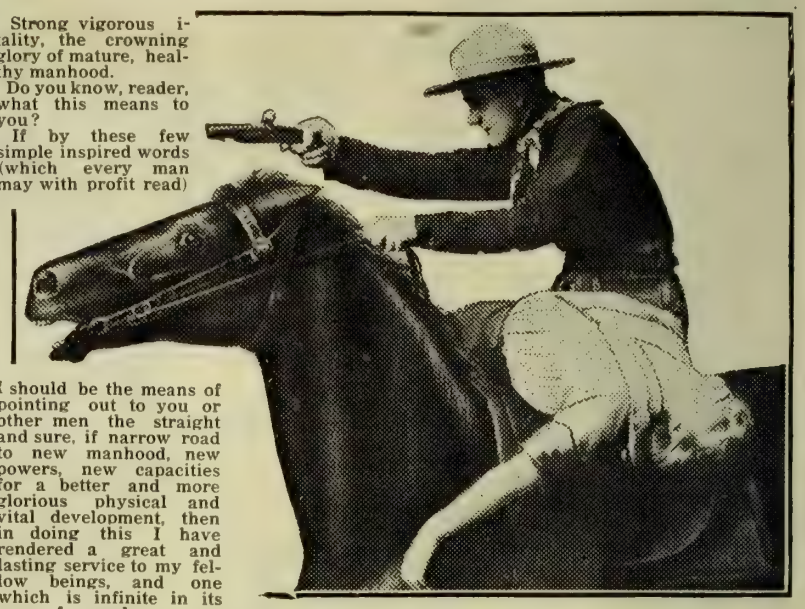
STEEL TROUGH & MACHINE CO., LTD. 9 James Street, Tweed, Ont.

Any Man May Easily Regain LOST VITALITY

Strong vigorous itality, the crowning glory of mature, healthy manhood.

Do you know, reader, what this means to you?

If by these few simple inspired words (which every man may with profit read)



I should be the means of pointing out to you or other men the straight and sure, if narrow road to new manhood, new powers, new capacities for a better and more glorious physical and vital development, then in doing this I have rendered a great and lasting service to my fellow beings, and one which is infinite in its power for good

This self-same VITALITY, this builder of manhood and manly vigor, may easily be regained, and I will tell you how.

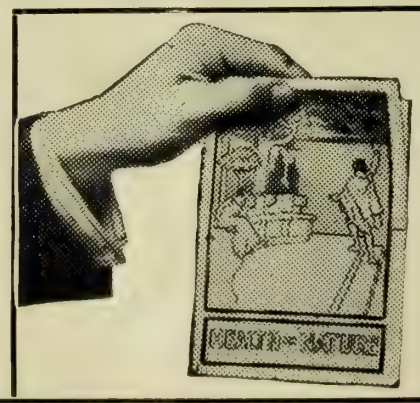
Have you ever stopped to consider that it is this VITAL FORCE which makes rugged men the real men that they are? It is this same MAN FORCE which is behind every great achievement in the world to-day, which gives the flower of our army and navy the courage to meet and face death unflinchingly, which gives the rough and rugged man of the plains that compelling power to rescue at all odds a loved one from some great peril, as our illustration here portrays, and it is this self-same, identical VITAL VIGOR which I must impart to you, reader, if you are not the man you should be.

Therefore, if I give you new vitality, I make you young again, and keep you feeling young the balance of your days. By increasing your vital supply, I soon have you answering "Simply feeling fine" to your friends' morning greetings, while they in their turn will secretly marvel at the wonderous change for the better which has come over you. A thoroughly vital, manly man is the greatest inspiration in the world; his power and fascination are felt by all women and all men alike who are near him. Nothing but death can conquer the giant of strength and manly vigor. On the other hand, how different with the half-man, the neurasthenic degenerate, who is burning up his vitality in dissipation and excesses! Is there any sight more pitiable, more repellent to one's sense of decency, then the weakling who deliberately kills his manhood and self-respect by acts of willful debauchery? Such a man has neither my sympathy nor can he proft by what of wisdom I can impart. But any man who is willing to make a fair, square fight for the return of his lost vitality and lost manhood, who will promise faithfully and honestly to discontinue any debasing practices or excesses he may be indulging, who will help me thus by helping himself to such, no matter how despondent he may be, no matter how weak and debilitated, no matter what years of folly have passed, to such a man I can offer all the encouragement in the world. Just lead a decent man's life, my friend, and then increase your VITALITY. All else will come.

I make and distribute a vitalizing appliance which I call a HEALTH BELT. I do not want you to get one of there HEALTH BELTS now nor to-morrow nor next week, for that matter, but first wish you to write for or call and get one of my little free books. I want you to thus have my whole story of this subject of VITALITY, so that you may judge for yourself. My HEALTH BELT, with suspensory attachment, is a complete treatment in itself; that is you place it comfortably around your waist nights when you go to bed and wear it at the time when you are asleep. The vitality which it produces and sends into your system hour after hour is felt as it flows in. There is no shock, but merely a pleasant, warm, soothing sensation which induces a sound, refreshing sleep. Weak back often disappears at once, and a better feeling is immediately experienced. Two or three months' wear is usually sufficient. The cost is nominal. With special attachments, my HEALTH BELT is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain, sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing or strong. Write or call to-day. Hours 9 to 6.



DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs—Please forward me your Book, as advertised, free, sealed.

per teeth. Now, if he carries this sideways motion so far as to go clear across the teeth on the upper jaw there would be an even wearing of the teeth, but, as a rule, he does not.

Consequently the inner part of the teeth on the upper jaw is worn off, and the outer part of the teeth on the lower jaw. Thus it is that a saw of sharp points is formed on the outer edge of the teeth on the upper jaw, and a similar ridge of points in the inner edge of the teeth in the lower jaw. In time, as the wearing goes on, these points wound the cheek or the tongue of the horse so that he cannot make the lateral motion of the lower teeth on the upper teeth, as the ridge prevents it; also he cannot use his tongue as he would or should in carrying the food between the teeth.

WHAT IS TO BE DONE.

Now, all that needs to be done is to float off these points. Never allow the rasp to touch the main crown of the teeth. In case this is done, then the enamel of the tooth is removed, and the tooth soon decays, and the nerve of the tooth is exposed and the horse can never again chew his food without pain. Ignorant men think the teeth need filing down with the tooth rasp, when they need no such thing at all. It is the striking of the points named that makes the grating noise sometimes noticed and not that the front teeth are so long the grinders (molar teeth) cannot come together. The front teeth never need dressing. They are used only to pull hay out of the rack or nip off grass; and they never get long, as many suppose. The gums, as the horse grows older, settle away from them and make them appear to grow longer than they formerly were. This is all the secret there is about filing of the horses teeth. Use care to file off only the sharp points, then stop as soon as the points or ridges are filed off.

A twitch is needed to be put on the nose, and the tongue carefully pulled to one side by an assistant, so that it may not be in the way of the one filing the teeth. Ignorance of what is needed spoils many a horse's mouth. It is seldom that all that is necessary to do cannot be done in ten minutes, and half the time is often enough when the rasp is a good one and the man who uses it understands his business. Ignorant men always try to do too much, and makes a great spread over a simple matter. It is more in the know how than in doing the needed work.—Dr. Smead, in Tribune Farmer.

Crooked legs in young horses are congenital, and in many cases accidental, that is not derived from sire or dam. If due to weakness, good food may do much to set them straight. Management of the hoofs in certain kinds of limb deformity will do still more. If the fetlock joint inclines outward, as is most frequently the case, then the inside of the hoof should be lowered as much as possible. If the toe turns inward, then the rectification is more difficult, but here also the inside of the hoof may be advantageously lowered.

"A horse is as good as his hoofs." This is an old and wise saying for without hoofs, a horse with a good body is worthless. It should be the aim of every owner of horses to keep the hoofs in as good condition as possible. Do not let the horses go too long without shoeing. Probably a long percenatge of the hoof ailments are caused by the neglect of the breeder when the animal is a colt. It is always a good plan to keep the little colt's feet neatly trimmed, for it is then that the destiny of the hoof is determined.

Horsemen Attention!

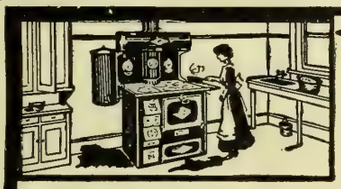
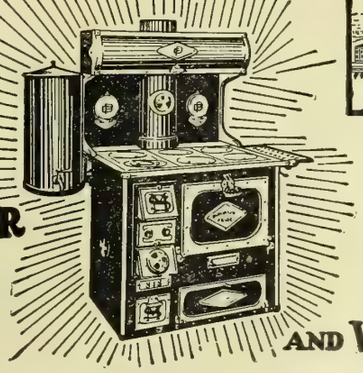
Horse Liniment

AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

DIRECT FROM FACTORY TO KITCHEN





SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.

$41.00 TO $49.00

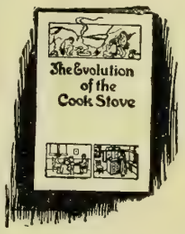
AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price

Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of tough, strong, malleable iron and the best blue polished steel—materials which will not warp, crack or break.

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it saves over 30% of fuel, burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41, or to any station in the four Western Provinces for $49—$5 to be sent with order and balance to be paid when the Range is delivered at your station. If not convenient to pay cash we will arrange to accept your note.

Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

We wish to call your attention to the fact that most infectious diseases such as whooping cough, diphtheria and scarlet fever are contracted when the child has a cold. Chamberlain's Cough Remedy will quickly cure a cold and greatly lessen the danger of contracting these diseases. This remedy is famous for its cures of colds. It contains no opium or other narcotics and may be given to a child with implicit confidence. Sold by all dealers.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. MAXWELL'S
HIGH SPEED CHAMPION

The Wringer Board extends from the side, out of the way of the cover. This allows practically the whole tep of the tub to open up—makes it easy to put in and take out clothes.

No other washer has as large an opening. No other washer can be worked with crank handle at side as well as top lever.

Do you use Maxwell's "Favorite"—the churn that makes quality butter?

Write us for catalogues if your dealer does not handle them. 89

FREE This 150 PIECE Complete Scholar's Outfit FREE

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water colors paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit containing type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 complete dater good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it this scholar's complete outfit is FREE. We are determined to sell a million packages of Marvel Bluing this year and are sparing no expense to reach this mark.

Marvel Bluing is a great improvement on the old style of bluing and goes twice as far. Everybody buys it because it is so good and a present is given away with every package.

We will give you one of these grand scholar's outfits IF YOU WILL AGREE TO SELL ONLY 25 PACKAGES OF MARVEL BLUING AT ONLY 10c. PER PACKAGE. Any boy or girl can sell 25 packages easy. No trouble at all.

We send you the Marvel Bluing free and trust you with it until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits.

Try. If you can't sell the Marvel Bluing send it back to us.

Address to-day THE MARVEL BLUING CO., Dept. G. 101 Toronto, Ont.

EVERY BOY AND GIRL IS ALWAYS PLEASED WITH OUR PREMIUMS

When Writing Advertisers Please Mention the Maritime Farmer.

FREE!! $200.00 IN CASH

AND 100 VALUABLE PREMIUMS GIVEN AWAY

1st Prize, $50.00 in Cash. 3rd Prize, $35.00 in Cash.
2nd Prize, $40.00 in Cash. 4th Prize. $25.00 in Cash.
5th to 9th Prizes, each $10.00 in Cash.

Herewith will be found the picture of a Chinaman washing clothes. Hidden about his figure and tub are seven faces. Can you find them. It is not easy, but can be accomplished. Try—you may win a cash prize by doing so. Many have done this as will be shown by the names and addresses published below. If you find the faces mark each one you find with an **X** cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them."

Write these nine words plainly and neatly, as in case of ties, both writing and neatness will be considered factors in this contest.

This may take up a little of your time, but as there is TWO HUNDRED DOLLARS in cash and One Hundred premiums given away, it it worth your time to take a little trouble over this matter.

Remember, all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

We do not ask You to Spend One Cent of Your Money in order to enter this Contest,

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over One Thousand Five Hundred dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This competition will be judged by two well known business men of undoubted integrity, namely, the advertising Managers of the Montreal Daily Herald and Montreal Daily La Presse, whose decisions must be accepted as final.

Below will be found a partial list of the names and addresses of a few persons who have won some of our larger prizes in recent contests. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of anyone else, **as all previous winners of cash prizes are debarred from entering this contest**

How to Disinfect a Dairy Stable.

The following inquiry has come from a reader, and it is of such importance that we shall give it more than the usual attention in a condensed reply: "I wish to disinfect thoroughly some old barns I have recently bought, rendering them safe for my cattle. Will you advise me what to do and how to do it?"

In disinfecting a stable there are some fundamental principles to be borne in mind; but unfortunately they are often left out of the procedure. It should be remembered, for instance, that disease is due to infection by germs; that the germs are minute and may remain effective for extended periods in stables that are dark, dirty and badly ventilated, and that any method of disinfection that does not also do away with these unsanitary conditions and keep them permanently away, must fail of success. Germs thrive, grow and live in the dirt of dark, damp places. So do the insect and vegetable parasites which prey on farm animals. Sanitation, suggested by the need of sunlight, ventilation and cleanliness, therefore has the twofold effect of lessening the chances of infectious disease and keeping animals free from parasite foes. Take tuberculosis, for example. The disease is due, as all of our readers are aware, to the specific bacillus of the disease. No case of tuberculosis can start without its seed—the bacillus. The dark, damp, hot, badly ventilated stable cannot produce the disease any more than one can grow a crop of corn or potatoes without planting seed corn or tubers. This is true of all other germ diseases. The start of all disease is always the presence of the specific germ. It must next be remembered, however, that an animal living in a stable of the unsanitary sort will be an unhealthy beast, with impure blood, sluggish circulation, and overworked, impaired excretory organs. Disease once started runs the most rapid and fatal course in the unhealthy occupants of the stable.

The direct rays of the sun will quickly kill the germs that cause tuberculosis. The bacillus of tetanus cannot cause lockjaw in the presence of fresh air (oxygen). The germs which cause glanders, pneumonia, blood poisonong, pus formation and pus absorption (pyaemia) naval infection, strangles (colt distemper), influenza, shipping or stock yards fever of horses, purpura haemorrhagica, haemorrhagica septicaemia, anthrax, blackleg and some other diseases, including John's disease, contagious abortion and infectiouss vaginitis, all most surely affect animals and lurk and linger longest in the stables that are not rendered hygienic by lighting, frequent cleansing and adequate ventilation.

With a full appreciation of these essentials, then disinfection of a stable entails the putting in of a sufficient amount of window glass to allow free entrance of God's good sunshine, which kills germs and is otherwise absolutely necessary for health. Each adult animal in a stable should have at least four square feet of window glass for this purpose. Fresh air is as essential, and so the stable will have to be perfectly ventilated. The King system now predominates in popularity, because it gives entrance to fresh air at the level of the ceiling, forces the warm air down upon the cattle and through the medium of many air shafts in the walls and connecting with high chimneys in the roof, sucks out the vitiated air from the ground surface. True disinfection renders the provision of some such system of ventilation imperative in every stable.

See to these things first; then remove from the stable everything that possibly can harbor germs. Tear out

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Annapolis Valley Fruit Farm
Equipped; Big Money-Maker

One of the best apple orchards in the Valley, picking 1000 bbls. in season; 96 acres; near neighbors, school, churches and depot; everything is here to make farming an ideal occupation; borders salt water; splendid 2-story, 12-room house; 2 barns, one 40x60; cuts 75 tons hay; abundant supply wood and timber; accident to owner induces him to throw in full line stock, tools and machinery; the low price for this splendid profit producer is only $7300, part cash; for traveling instructions for this and a 228-acre fruit farm for only $1900, see page 61, our New Mammoth Farm Catalogue No. 35, The MARITIME FARMER, Box D., Sussex, N. B.

If You Have Live Stock For Sale Advertise it in the Maritime Farmer.

and burn all saturated, porous, ancient timber of mangers, feed boxes, and hay racks, walls, floors, partitions and other parts of the internal fittings of the stable. And to the creamating fire all old bedding, soiled feed and trash. Dig out four inches of dirt floor and put in new, clean earth, or a clay and cinder compost mixture wetted and tramped down; or, far better than either, put in a concrete floor. Scrub and scrap the remaining woodwork or stonework. Get the dirt out of every nook crevice, crack, cranny and corner. Get rid of those festoons of cobwebs. They are filthy, germ laden, yet often left by the superficial cleaner of the stable.

Now saturate everything above, below and on every side, with a strong effective, disinfecting solution. That means a solution that will actually kill each germ it touches; not merely stan it, make it weak, wobbly, or sick at the stomach. Such a disinfectant may not have a bad smell. Some of the poorest of disinfectants smell the worst. Use a solution of six ounces of formaldehyde to the gallon of water; or a 1-50 mixture of commercial coal tar disinfectant; or compound solution of cresol; or two or three ounces of liquid carbolic acid (95 per cent pure) to a gallon of water. Put the liquid on with a spray pump which forces it into every place possibly occupied by germs and follow it with a thorough spraying with fresh-made lime wash containing a pound of chloride of lime to each three gallons.

The following formula for lime wash with an added disinfectant, is also recommended by the Bureau of Animal Industry: To prepare five gallons: Slake 7½ pounds of lime, using hot water, if necessary to start action. Mix to a creamy consistency with water. Stir in 15 fluid ounces of 95 per cent. pure liquid carbolic acid and make up five gallons. Stir thoroughly and strain through a wire sieve, if it is to be applied by means of a spray nozzle. Where disease has been known to exist we do not only disinfect the entire stable according to the above plan, but also flood the floors with the lime and disinfectant wash combination.—A. S. Alexander, V. S., in Rural New Yorker.

A Business Man With a Business Herd.

(Continued from page 152)

The stock is then watered—there is a watering device in each stall but the water is only turned on morning, noon and night. After the morning drink a liberal quantity of hay is fed. At 2 o'clock P. M. the feeding operations are again repeated and the milking operations are completed shortly after five o'clock P. M. and at six o'clock, the chores having been all completed the barns are closed for the night.

The cows are fed on an average about 40 pounds roots or ensilage, 4 pounds bran, 4 pounds crushed oats and one pound oil meal. These quantities are decreased or increased according to the needs of the respective animals as indicated by the record sheets.

We also saw several promising young heifers and bulls that will go forth to improve some other herds.

Mr. Irving is a farmer because he thoroughly enjoys working the soil. He is a lover of good stock and his is an example that our young men may well imitate. He is striving to make his home district better than he found it. May his shadow never grow less.

NA-DRU-CO
Syrup of Linseed, Licorice & Chlorodyne

is an absolutely reliable household cough-and-cold remedy, prepared by expert chemists. It quickly relieves coughs, and if taken when the first symptoms appear it breaks up colds before they become serious or troublesome.

It's a good thing to keep always on hand in the Medicine Cabinet.

In 25c. and 50c. bottles, at your Druggist's.

Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is necessary to [illegible] perseverence you can probably make out 5 or 6 of them. To the person who [illegible] we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars. To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars. Should two persons send answers containing the correct, the first two prizes will be divided between them, (each receiving $75.00). Should three send in correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you cannot make out anything like a complete list, write us at once enclosing 2 cent stamp for our reply. DO NOT DELAY. WRITE AT ONCE, Address, CANADIAN MEDICINE CO., Dept. 81 MONTREAL, QUE.

A root cellar like this won a prize last year.

THE drawing was made from a photograph of the root-cellar with which D. A. Purdy, of Lumsden, Sask., won a cash prize in last year's contest. In that last contest there were 36 prizes. There will be *three times as many prizes* (108) in the

1912 FARMERS' PRIZE CONTEST

THUS you will have three times as many chances of winning a cash prize. You do not have to use any certain amount of Canada Cement to win a prize. There are absolutely no "strings" to this offer.

There are twelve prizes for each Province (three of $50; three of $25; three of $15; and three of $10) and you compete only with other farmers in your own Province and not with those all over Canada.

It makes no difference whether you have ever used cement. Many of last year's winners had not used it until they entered the contest. When you write for full particulars, we will send you, *free*, a book, *"What the Farmer Can Do With Concrete,"* which tells everything you need to know about concrete. It is absolutely free, and you are under no obligation to buy "Canada" Cement or to do anything else for us.

WRITE your name and address on the coupon, and mail it, or use letter or post card, and we will send you at once the book and full particulars of the 1912 Prize Contest.

A Piano is no better than its hidden parts. That's why we so confidently ask you to compare the Sherlock-Manning 20th Century Piano with the best makes.

MARK you, we do not urge you to buy a **Sherlock-Manning Piano**—we simply ask you to **compare** the **Sherlock-Manning** with the world's best.

We know that the **Sherlock-Manning 20th Century Piano** is

"Canada's Biggest Piano Value"

and we believe that **your** judgment or the judgment of any **unbiased** master musician, will confirm our opinion.

But, before you decide, find out the essentials of a perfect piano—the features that make for lasting tonal beauty.

The piano **you** buy **shou'd have**

—**The famous Otto Higel Double Repeating Action**
—**Poehlmann Wire,** the best piano wire made.
—**Weickert Felt Hammers,** the hammers that endure
—**A Full Iron Plate,** and
—**Billings Brass Action Flange,** the latest improvement.

There are other essential features, but ask to be **shown** these—**the most essential.** You will find that only **high-grade, first quality** instruments possess these. Now **Sherlock-Manning 20th Century** is the **embodiment of quality.** It possesses **every** feature that makes for **piano excellence** and the **lasting** life of the instrument. Yet—**you can save money**, a considerable amount of money, if you buy a **Sherlock-Manning Piano**. Ask us to **show you** where and how the saving comes in. Write for **inside information** anyhow.

"Hello, Tommy! Chores done already?"
"Yep! Aint you seen our new Litter Carrier?
It's a cinch—You should write to
Dillon's for their book—same as Dad did."

You can if you work hard enough, and if you have the time and patience, keep stables perfectly clean with the help of fork, broom and wheel barrow.

But those were ways of twenty years ago —before labor was so high and hard to get.

Stable Cleaning by the Dillon Method can be cut down to less than half the time, and a quarter the labor formerly required,

Your man's time is valuable — then cut down the time he spends cleaning the stables.

Your stock is valuable—then give them cleaner and healthier surroundings.

DILLON'S Litter Carrier

Figure it out for yourself.
Get our free book.

Dillon's sell direct to the Farmer. There are no Agents and no Agents' profits. The price is the same to all, and lower than you would expect for such substantial and well-built equipment. DILLON'S BOOK ON CLEAN STABLES gives you an exact idea of what you can accomplish for a small outlay. Write for a free copy. 2

R. DILLON & SON
OSHAWA, ONT.

Gid, Sturdy or Turn-Sick.

The sheep is subject to a very serious malady that causes severe illness called gid, sturdy or "turn-sick." The first and the last names are descriptive of the trouble, because the animal suffering becomes very giddy and often turns about in a circle in an aimless sort of way. Some animals are simply dull and stupid, but generally unsteady on their feet, while the head is carried on one side. Sometimes blindness comes on, but in nearly every case the poor creature is unable to feed, and if a remedy is not applied it soon becomes exhausted, wastes away and dies.

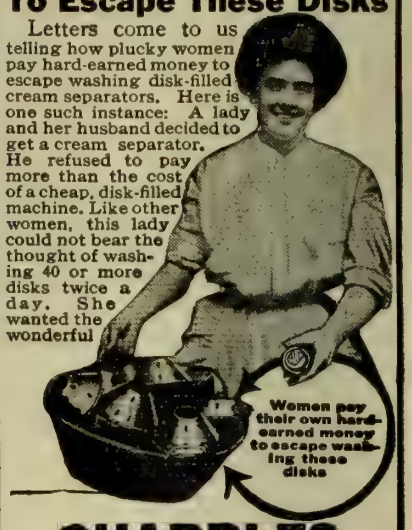
Now the cause of this illness is the development of a cyst or small bladder on the brain. It is a little bag, so to speak, varying in size, but sometimes as big as a hen's egg, and contains a liquid, while on its surface is a large number of little white spots, each of which contains the head of what will in due course become the tapeworm of the dog. They remain in this stage until the sheep dies or is killed or the cyst is removed by surgical means, and this is how the trouble comes about. The cyst is thrown away, and often attracts the notice of the dog, always in search of food, who promptly swallows it. In the dog the full tapeworm is developed, and thus the poor animal suffers also. In due course portions of the tapeworm are voided, and if the dog runs about the pastures, as dogs on farms generally do at some time or other, they are deposited on the grass where the sheep graze. They are, of course, minute in size, and are swallowed by the sheep in the act of feeding. They bore their way through the wall of the stomach, and are carried by the blood vessels to the brain and to other parts of the body. They develop once more into the cysts, and so it goes on from year to year unless a stop is put to it.

What are the measures to take then? Obviously, if the dog is found to be infested with tapeworm he should be confined until, by means of medicine, the worm is got rid of, and this—all portions of it—should be burnt. Remember that the head of the worm is the narrowest portion, and the work of destruction is not finished until this has been voided and dealt with. If the sheep are suffering from gid, when they are killed or when they die let the cysts be treated in the same way. By this means the cycle will be broken, and neither animal will be troubled. But there is danger from stray dogs running in the fields, so that watch should always be kept and decided measures taken as soon as there is evidence of the presence of either cyst or worm.

The dog suffers greatly from the presence of the tapeworm, but this is comparatively a small matter when set against the loss and suffering in the case of the sheep, because, owing to the position of the cysts in the brain, it is very difficult to apply any remedy. Some shepherds are very skillful in the operation of piercing the skull and puncturing the bladder, parts of which they manage to remove, thus giving relief to the sheep; but this, as may be imagined, is a very difficult and indeed a dangerous operation, and few people who are not trained veterarians can carry it out successfully. Moreover, the value of the average sheep does not permit of the payment of high fees for skilled assistance of this kind, so that the general course is that the animal suffers until it dies, or—if at all fit for killing—it is sent to the butcher. Even in the latter case there is distinct loss, for a good price cannot be obtained for an unfinished animal, and all that can be said of this method is that it is making the best of a

SHE PAID
To Escape These Disks

Letters come to us telling how plucky women pay hard-earned money to escape washing disk-filled cream separators. Here is one such instance: A lady and her husband decided to get a cream separator. He refused to pay more than the cost of a cheap, disk-filled machine. Like other women, this lady could not bear the thought of washing 40 or more disks twice a day. She wanted the wonderful



SHARPLES
Tubular Cream Separator

because Dairy Tubular bowls contain only the little piece shown in this girl's left hand. She knew Tubulars have twice the skimming force of others and skim twice as clean, thus paying more every year in extra profits than could be saved through buying any cheap machine. So she added her own hard-earned money to what her husband was willing to pay and bought a Sharples Tubular. Now she is one of the happiest, most contented separator users you ever saw. What higher praise could be given Tubulars?

Do you want a free trial? Do you want to exchange your old separator in part payment for a Tubular? You can do either. Ask for Catalog No. 194

COULD NOT LET ANYONE TALK TO HER

SHE WAS SO NERVOUS.

Diseases of the nervous system are very common. All the organs of the body may be sound while the nervous system is all upset, on account of the troubles and worry which fall to the lot of one who has to look after the troubles incident to housekeeping, and when the nerves become unstrung the heart is also affected.

In Milburn's Heart and Nerve Pills is combined a treatment that will cure all forms of nervous disorder as well as act on the heart itself, and for this reason we would highly recommend them to all run down women.

Mrs. Wm. Smith, Terra Nova, Ont., writes:—"I wish to tell you that I have used Milburn's Heart and Nerve Pills. I was so nervous I could hardly let anyone talk to me until a neighbour told me to try your Milburn's Heart and Nerve Pills. I got three boxes, and did not have to get any more as they completely cured my nervous system."

Milburn's Heart and Nerve Pills are for sale at all dealers, or mailed direct on receipt of price, 50 cents per box, 3 boxes for $1.25.

The T. Milburn Co., Limited, Toronto, Ont.

bad job. If the disease is at all advanced and the animal has become emaciated, the flesh is of course unfit for food.

As a dog may suffer from tapeworm for some time before the signs are noticed, it is a good plan to tie up every dog for a few days in the spring while a dose of medicine is operating. Various rough and ready methods of trying to get rid of the cysts are adopted, but as they involve somewhat brutal treatment and are absolutely ineffective, no good purpose would be served by detailing them.

WATER FOR SHEEP.

While it is quite true that sheep drink very little water, the notion entertained largely that they require none is quite erroneous. It should be remembered that in ordinary conditions the sheep consumes a large amount of liquid with its food. Roots, for example, contain some 80 to 90 per cent. of water, sometimes even more. That is to say, in 100 lb. of turnips, between 80 and 90 lb. will be water, and this is equal to over 8 gallons. Again, the grass in this country is generally, during part of the day, coated with moisture, and, when grazing, the sheep then obtains a supply of liquid sufficient for its modest needs. But in times of drought, when the earth is burnt up, or when a large proportion of dry food is given to them, sheep need a direct supply of water and they suffer without. At one particular season, also, when the ewes are suckling their lambs and the demands upon the mothers are very heavy, a supply of water is urgently required, and it is cruelty to withhold it. The careful flock master will see that it is provided, and if it is kept available where they may run to it at will, he may be sure that the animals will not drink more than is good for them, and they may safely be left to satisfy their own needs. The water for the ewes and for the sheep generally should always be the purest and best obtainable, but indeed, the use of impure water for any kind of stock is strongly to be condemned.

The Dog and the Sheep.

The dog is without doubt the most intelligent of all the domestic animals, and he shows a capacity for understanding what he is expected to do by his master which is astonishing to those who are not well acquainted with his ways. Those who have watched the sheep-dog trials at Tring and elsewhere—arranged it is true largely with a view to the spectacular, but including nothing which is not part of the work ordinarily carried out by the shepherd's four-footed assistant in his task—have noted with admiration how skillfully he will guide his charges through an intricate labyrinth or "puzzle arrangement" of hurdles and bring them eventually to the desired spot, and this without any better guide than the signs of his master.

On the farm the dog is invaluable, and we should be the last to depreciate the services of the animal who is the constant companion of man and who has the knack of worming himself into the affection of his owner to an extent that is sometimes embarrassing. But it is well to point out that the dog, while an excellent servant if well trained, may, if badly trained, or not trained at all, which comes to the same thing, be not only a nuisance but a source of positive danger to the animals of the farm. And it is a common experience that on many a holding there is "too much dog," particularly among the sheep. Sheep are very timid animals, provided with very little in the way of defensive weapons, and when a dog is used to round them up they are often in a frenzy of excitement, and rush about in all directions, knocking against each other and, in the case of

The COLONIAL FERTILIZER CO.

OF

WINDSOR, N. S.

To supply the increasing demand for commercial fertilizer, in the Maritime Provinces, we have erected at Windsor, N. S., the LARGEST AND MOST COMPLETE FERTILIZER FACTORY IN THE DOMINION OF CANADA. We are confident that the quality of our goods, the results they will give and our business methods, will give us a good share of the fertilizer business in New Brunswick and Nova Scotia.

OUR FERTILIZERS are made of the very best materials that it is possible to obtain. The base of our goods is animal matter—bone, blood and tankage—which return to the soil, the materials which the growing animals have removed. To these we add Potash—of which we are direct importers,—and enough chemical salts to give the crops an early and vigorous start.

OUR PLANT is equipped with the most up-to-date machinery for mixing, grinding and screening our fertilizer which insures good mixing of all the different materials, and its ***arrival in your hands in perfect mechanical condition.***

OUR MANAGEMENT is thorough and capable and we have at the head of our sales department and factory, an experienced fertilizer man who has been associated for many years with the largest fertilizer companies in the country. This means that our materials will be the best, our brands what the crops require and every care will be taken to turn out the best goods that careful and efficient management can give.

We offer a large number of brands varying in analysis and price from the lower grades to be used with stable manure, to the very highest grades which require no other dressing of any kind.

We want a good man to sell our fertilizers in every district in New Brunswick and Nova Scotia.

Write for prices and terms to this office or to our general agent for New Brunswick. JAMES M. McLEOD, Wilmot, N. B.

BREEDER AND IMPORTER OF

Clydesdale Horses

of the highest quality and breeding

The stud includes the noted show and breeding horse

"Baron Kelvin"

Every brood mare is a first prize winner at Scotch and Canadian shows. Driving horses generally on hand.

Shetland Ponies of the smallest type and best breeding

Polled Angus Cattle of the most fashionable strains

Herd won first prize Toronto in 1906 and many other shows. Also small herd of Shorthorns from imported deep milking families.

Friesian Holsteins

WHEN starting Friesian Holsteins, start right and buy your stock from the prize winning herd of the Sea View Stock Farm, Buctouche, N. B., which herd carried off 30 prizes from St. John and 26 from Halifax Provincial Fairs (1912) including firsts and seconds for Males and Females as well as the lion's share of the best prizes throughout. All animals from this herd will be sold at the right figure on account of scarcity of room. The following is a list of some of the stock I have to offer: 4 cows; 2 bulls, 15 months old; 2 heifers 1 year old and several Heifer and Bull calves, all prize winners and from prize winning stock. If you intend buying the right kind of stock do not delay as my herd is dwindling down rapidly. When buying, buy the right kind of stock with the right blood, at the right place and at bargain prices.

Sea View Stock Farm

J. D. IRVING, Prop.

BUCTOUCHE, N. B.

Wish-Ton-Wish Stock Farm

BREEDERS OF

High Class Holstien, Friesian Cattle, and Berkshire Pigs

A few good young cows that have freshened and bull and heifer Calves for sale, sired by Schuiling Sir Posch, twice grand champion Holstein bull at the Canadian National Exhibition at Toronto; also some sired by Sir Sir Mercena Laforit Lad, who won first prize where ever shown.

Can spare a good Berk sow or two ready to breed, am also booking orders for young pigs for spring delivery.

HARDING BROS.

PROPRIETORS

Welsford, New Brunswick

in-lamb ewes, a vast amount of damage is done in what may be only a few minutes pleasureable excitement to the canine animal.

Far too often the dog, accompanying his master or some member of the family, runs about the fields and indulges in a little scamper on his own account, and the mischief done in these journeys may be incalculable. We remember an old farmer of experience declaring that he would never allow a strange dog near his in-lamb ewes, and that he restricted the use of even the shepherd's dog. And it is hardly necessary to state that the shepherd's animal, which is probably well known to the flock and is in the work, is much less harmful than the majority of cases trained for his chance and irrepressible dog who takes a delight in barking and yelping at the heels of the frightened sheep, not biting them perhaps, but putting them into a fever of excitement which, in the special case referred to, may result in a loss of many pounds to the owner of the flock. A demonstrative dog may give a serious fright to a child, or even to an adult, before his playfulness becomes manifest, and naturally this is true in a greater degree where such a timid animal as the sheep is concerned.

The dog found guilty of chasing sheep on its own account should be immediately banished. Great losses have been reported from time to time to have been caused by the "driving" of ewes, who in their fright have rushed hither and thither and, falling into ditches on top of each other, have been smothered- A heavy ewe is particularly prone to accidents of this kind, and has very little power to extricate herself when turned over in a ditch or stream; and whatever good points such a dog may have, he is out of place near a flock, and should be removed from temptation. What may be merely sportiveness to him is death to the ewe. There are dogs, of course, who hunt sheep for the purpose of worrying them, and sharp measures of repression are needed in their case.

But there is another way in which the dog, even the shepherd's well trained animal, may be a source of danger to the sheep, and the facts show the curious connection that exists between various forms of animal life.

Extensive Additions to I. C. R. Rolling Stock.

Although the rolling stock has been largely augmented during the past year, the tremendous increase of the Intercolonial Railway has made it necessary for further additions, and arrangements are now under way for large orders for both cars and locomotives.

The development of the freight business on the Government line during the past two years is one of the healthy signs of the growing industrial development of the Maritime Provinces.

The total tonnage carried during the past year has largely exceeded all past records and is steadily increasing.

Various products are now being rushed through by the fast freights to the West that a few years ago were only handled in limited quantities. Large shipments of fresh and cured fish are being made from Mulgrave and from Halifax, and there is this year a very heavy movement in Nova Scotia apples to the Canadian West.

Plaster and gypsum are also being shipped extensively while the lumber shipments are very heavy. The past year has been a record breaker in the I. C. R. freight business.

SASK-ALTA STEEL RANGE

Winter Protection of Young Apple Trees.

INJURY FROM VERMIN.

Precautions must be taken to prevent injury from mice, rabbits, etc. Many failures in apple growing here and elsewhere are caused by these pests and a large annual toll in the form of dead trees is annually exacted by them. As far as possible crops harboring and attracting such pests should be avoided and the accumulation of litter, trash, weeds, long grass, etc., which furnish suitable winter quarters for these animals, prevented. Mice work under the snow and damage from them may be prevented by tramping the snow solid round the tree after the first few snowfalls. This method of protecting is, however, somewhat dependent on the weather. The cheapest and safest protection is secured by wrapping the trunks cylinder fashion with paper, wood veneer or some such material. Good strong building paper, as light as possible in color gives good satisfaction. This may be placed round the trees in the fall, not tightly, but leaving an inch or so of space between the inside of the paper and the bark of the tree. The soil should then be mounted up around the bottom of the paper to a height of six inches or so. Veneer tree protectors, made of thin material one-eighth inch thick, 12 inches wide, 18 inches long, and costing about one cent each will last three or four years and afford good protection. The paper or veneer as the case may be should be removed in the spring, about the middle of April.

SUN SCALD.

This form of damage is very common in some localities, so common, in fact, that a tree which escapes it is a rarity. The greater part of the damage occurs in late winter, or during the warm spring days when the snow is going off. During the warm afternoons the sun, reflected from the snow against the south-west sides of the tree trunks, becomes very warm. The trunks are thoroughly warmed on that side. They are thawed out, and the bark becomes soft, sappy and pliable. Then, when the sun goes down and the temperature falls again to zero, the bark is again frozen tignt. The next day the same thing happens, and so day after day the young bark freezes and thaws, and by this means is torn to shreds. When spring arrives the bark is killed and broken open. Then various kinds of fungi get in and the damage which begins by freezing and thawing ends with spread of canker and other troubles all round the trunk of the tree. The best preventives of sun scald are low heads and veneer and paper cylinder protectors. High-headed trees, which are of doubtful value anywhere, are altogether undesirable in places where sun scald is bad The protectors of paper or wood veneer recommended above for mice and rabbits will also give practical immunity from sun scald. This trouble is a very serious one. It is not uncommon to find entire young orchards ruined by it. In sections where this trouble is prevalent great pains should be taken to protect young orchards from it. For the benefit of the fruit growers the Fruit Growers' Association has secured about 3000 veneers and will fill orders for them at cost price. Apply to the Secretary N. B. F. G. Association, Fredericton, N. B.

You will find that druggist's everywhere speak well of Chamberlain's Cough Remedy. They know from long experience in the sale of it that in cases of cough and colds it can always be depended upon, and that it is pleasant and safe to take. For sale by all dealers.

We Want To Tell You How Your Community Can Operate A Successful Telephone System Of Its Own

The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada

THE number of rural telephone lines started during the last year has been greater than ever before in the history of Canada. If, indeed, it has not been started already, your own community is bound to have a telephone system, sooner or later. You would have such a system at once, if you and your neighbors only realized how quickly, easily and inexpensively it could be put into operation. You, yourself, can start this system going right away; with the help we offer, you can interest your friends and neighbors and, among you, can organize your own company, erect your own line, install your own instruments, and operate your own self-maintaining telephone system, just as successfully as the largest telephone exchange is operated in the largest city on the continent.

This Bound Volume of 100 Illustrated Pages is FREE

NEVER, since farmers first started installing their own telephone instruments, has there been produced so comprehensive a volume of instructions as our book "How to Build Rural Telephone Lines." This book, printed on good paper, illustrated with photographs and diagrams and bound in stiff, cloth covers, is an invaluable text-book on the subject of constructing telephone lines in the rural districts. Written in plain language by expert telephone engineers, it has been a very costly book to produce. It is really almost too valuable to give away free; we could not afford to distribute it haphazard. However, we have one copy for you.

BUT We Send It Only When You Ask For It

"How to Build Rural Telephone Lines" tells about what other rural telephone companies have done, about company organization, about constructing the line, about installing the instruments, about the materials required, about the instruments themselves, and also even gives the law in regard to wires crossing railways, etc. Chapter after chapter, it goes into each item in detail. Nowhere else are the facts so concisely set forth as they are in this book.

You Can Organize Your Own Company

YOU don't need to know anything about company organization to start a company among your own friends and neighbors. Our book tells all about both mutual and stock companies and shows you, step by step, just exactly how to go about the matter. It shows you how the procedure differs in the various provinces, what the different governments demand of you and what they will do to help you.

You Can Build Every Foot of Your Own Line

NO expert lineman or superintendent of telephone construction is necessary to build the efficient line that you can put up yourself by merely following the detailed instructions given in this book. Any man who can read and who will follow directions with ordinary sense can build his own telephone line. With the instructions that you can give your neighbors after you have read this book, they can erect every pole, place every crossarm, string every foot of wire and install every instrument. You can easily realize how this means economical construction.

We Will Guide You In Every Step of Organization and Construction

WE are the largest manufacturers of telephones in the Dominion of Canada. Nine out of every ten telephones in use in the country to-day have been made in our plant. You can readily understand, therefore, that our experts are the master-minds of telephone construction in the Dominion. It's the knowledge of these men that we place at your disposal—it's their expert advice that will guide you in every step.

Let Us Show You How To Get The Movement Started

FARMERS throughout the country are just beginning to realize that they can have telephone connection as well as if they lived in the city. They are tremendously interested in the subject. Most of them have been reading it up in their farm papers. It is only necessary for some one man to come forward with definite knowledge on the subject and say: "Let's get started!" With the information that our book will give you, you can be the man in control of the situation in your community.

Now Is The Time For You To Act — Before Someone Else Does It

WRITE in to us and get this book at once. A self-maintaining telephone system will eventually be started in your community. If the moment is not ripe, the time is fast approaching when it will be, and you owe it to yourself to be informed on the subject. If you want the book send us the coupon.

WIRE FENCE PRICES

TO BE ADVANCED JANUARY 15, 1913

The SARNIA FENCE COMPANY, Limited

SARNIA, ONTARIO

OWING to the continued advance on all steel products, all wire Fence Manufacturers have been notified by their wire makers that after January fiirst wire will cost them several dollars per ton more than they were obliged to pay during 1912. Consequently after that date we must increase our price of fence. It is unusual for the consumer to be given a chance to save paying the advance, but we are going to give the Farmer an opportunity to get his fence for another season at the low price. Now we have a contract with our wire makers to furnish us with all the wire we can use prior to December 31st at the old prices, and we are giving you an opportunity to buy before January 15th at the old price. This opportunity will give you a larger return for your investment than anything we know of; PLACE YOUR ORDER NOW and save for yourself what would go to the steel manufacturers after the first of the year. ANY ORDERS RECEIVED BY US PRIOR TO MIDNIGHT OF JANUARY 15th, 1913, IF ACCOMPANIED BY REMITTANCE; WE WILL GUARANTEE TO FILL AT THE PRICES GIVEN BELOW OR AS SHOWN IN OUR CATALOGUES; on January Sixteenth our prices for fencing will advance as shown below. State in your order if you wish your fence shipped at once or at a later date. Remember that our January advance is brought about through the wire market advancing. Prices on wire have advanced to every fence manufacturer in Canada as well as ourselves, and their new prices will be proportionally several cents per rod higher than our direct to the farmer prices. We still give you the saving of dealers profits and agents commissions. Don't let this opportunity slip by, SEND IN YOUR ORDER NOW. Manufacturers seldom give the farmer notice that will protect him. We prefer to buy wire at a low price and give it to you at the low price rather than pay wire makers an advance, and then have to charge you the difference.

The Sarnia Fence Company's direct to the farmer policy has saved the farmers of Canada many thousands of dollars. We shipped over seven hundred carloads of Royal Fence during 1912. We number our pleased customers by the hundreds of thousands. The above offer is another proof of our loyalty to the farmer. We propose to protect him to the utmost of our ability. Our well known guarantee YOUR MONEY BACK, AND WE PAY FREIGHT BOTH WAYS IF DISSATISFIED holds good on every Bale of Royal Fence. READ THE PRICES, GET YOUR ORDER IN TO-DAY, SAVE FOR YOURSELF WHAT HAS NEVER BEEN OFFERED TO THE FARMER BEFORE.

5-40-0 Has 5 line wires 40 in. high 9 stays to the rod, all No. 9 hard steel wire. Spacing 10, 10, 10, 10, Price per rod if ordered before Jan. 15th	17c	Price after Jan. 15th	19c
6-40-0 Has 6 line wires, 40 in. high 9 stays to the rod, all No. 9 hard steel wire. Spacing 7, 7, 8, 9, 9, Price per rod if ordered before Jany. 15th	19c	Price after Jan. 15th	21c
7-40-0 Has 7 line wires, 40 in. high 9 stays to the rod, all No. 9 hard steel wire. Spacing 5, 6, 6, 7, 7 1-2, 8 1-2. Price per rod if ordered before Jany. 15th	21c	Price after Jan. 15th	23c
8-34 Has 8 line wires, 34 in. high 12 stays to the rod, all No. 9 hard steel wire. Spacing 3, 3 1-4, 3 1-2, 4 3-4, 5 1-2, 6, 8. Price per rod if ordered before Jany. 15th	25c	Price after Jan. 15th	27c
8-40 Has 8 line wires, 40 in. high 12 stays to the rod, all No. 9 hard steel wire. Spacing 3, 4, 5, 6, 7, 7, 8, Price per rod if ordered before Jany. 15th	26c	Price after Jan. 15th	28c
7-48-0 Has 7 line wires, 48 in. high 9 stays to the rod, all No. 9 hard steel wire. Spacing 5, 6, 7, 9. 10, 11, Price per rod if ordered before Jany. 15th	22c	Price after Jan. 15th	24c
8-48 Has 8 line wires, 48 in. high 12 stays to the rod, all No. 9 hard steel wire. Spacing 4, 5, 6, 7, 8, 9, 9, Price per rod if ordered before Jany. 15th	27c	Price after Jan. 15th	29c
9-48-0 Has 9 line wires, 48 in. high 9 stays to the rod, all No. 9 hard steel wire. Spacing 3, 4, 5, 5, 6, 8, 8, 9, Price per rod if ordered before Jany. 15th	27c	Price after Jan. 15th	29c
9-48 Same as 9-48-0, with 12 stays to the rod, Price per rod if ordered before Jan. 15th	29c	Price after Jan. 15th	31c
10-50 10 line wires, 50 in. high 12 stays to the rod, all No. 9 hard steel wire. Spacing 3, 3 1-4, 3 1-2, 4 3-4, 5 1-2, 6, 8, 8, 8. Price per rod if ordered before Jan. 15th	31c	Price after Jan. 15th	33c
11-54 Has 11 line wires 54 in. high 12 stays to the rod, all No. 9 hard steel wire, spacing 3, 3 1-4, 3 1-2, 4 3-4, 5 1-2, 6, 6, 6, 8, 8, Price per rod if ordered before Jan. 15th	35c	Price after Jan. 15th	37c
15-50P Stock and Poultry Fence, Has 15 line wires 50 in. high 24 stays to the rod top and bottom, No. 9 filling No. 12. Spacing very close for poultry, Price per rod if ordered before Jan. 15th	35c	Price after Jan. 15th	37c
Staples galvanized 1 3-4 in. per box 50 lbs. if ordered before Jan. 15th	$1.40	Price after Jany. 15th	$1.50
Brace wire (soft 25 lb. coil each) if ordered before Jan. 15th	75c	Price after Jan. 15th	85c
Barb wire, galvanized (two point), 80 rod spools, each, if ordered before Jan. 15th	$2.00	Price after Jany. 15th	$2.25
STRETCHER—An all iron stretched, top and bottom draw, very heavy chain. Extra single wire stretcher and splicer, freight paid with fence orders only, if ordered before Jany. 15th	$7.50	Price after Jany. 15th	$7.50

Farm Gate, made of 1 3-8 tubing, filled with all No. 9 wire, 12x48. Each	$4.00	Farm Gate 13x48, Each..	$4.25	Farm Gate, 14x48, Each..	$4.50	Walk Gate, 3½x48, Each..	$3.00

The above prices include freight prepaid by us to any railroad station (electric and boat lines not included), south of North Bay in old Ontario. We do not prepay freight on gates, stretchers, barb wire, brace wire or staples, except when ordered shipped with fence. ALL FENCE IN 20, 30 AND 40 ROD ROLLS ONLY.

Customers in New Ontario, Quebec, Maritime Provinces, and the North-West may deduct 2c per rod from the above prices of fence, 25c from the gates, stretcher and barb wire, 10c from the brace wire, and 15c from the staples; customer to pay his own freight from Sarnia. Remember, after January 15th the higher prices must be used. Write us, tell us what style you want, and we will tell you what your fence will cost you after paying your freight. We have never yet found a locality in the Dominion of Canada where our price with the freight added was not less by a good margin than your local or agent will ask you. We urge you to get your order to us before January 15th, in order to save the advance. Remit cash with order and we will guarantee the price. **ORDER TO-DAY.**

These prices on fence are less than the actual cost of the wire on the open market to-day, and in order to prevent speculators from ordering large quantities thus depriving the farmer of this benefit, we reserve the right to refuse any orders which in our judgment would come under this head.

FREE This 150 PIECE Complete Scholar's Outfit FREE

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water color paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit consisting type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 complete dater good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it this scholar's complete outfit is **FREE.** We are determined to sell a million packages of Marvel Bluing this year and are sparing no expense to reach this mark.

Marvel Bluing is a great improvement on the old style of bluing and goes twice as far. Everybody buys it because it is so good and a present is given away with every package.

We will give you one of these grand scholar's outfits **IF YOU WILL AGREE TO SELL ONLY 25 PACKAGES OF MARVEL BLUING AT ONLY 10c. PER PACKAGE.** Any boy or girl can sell 25 packages easy. No trouble at all.

We send you the Marvel Bluing free and trust you with it until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits.

Try. If you can't sell the Marvel Bluing send it back to us.

Address to-day **THE MARVEL BLUING CO., Dept. S.** 101 **Toronto, Ont.**

EVERY BOY AND GIRL IS ALWAYS PLEASED WITH OUR PREMIUMS

HOW do YOU clean your stable? Do you get the manure a good distance from the barn? Do you keep the stable yard clean? Do you spend HOURS at the job every day trying to get the manure across the yard? Or do you have to hire a man to do the stable work for you?

If YOU are using the PLANK AND WHEELBARROW method of carrying the manure from the stable to the pile—the photo above shows you how you MIGHT do it. Isn't it easy? Your boy can do the work and never turn a hair. He'll make a quicker cleaner job of it too.

It's Play with a BT MANURE CARRIER

FOUR BIG WHEELBARROW LOADS at a time—ONE big load cleans your stable. The work's done better too because there is a big wide-mouthed bucket lowered right down to the gutter, into which you throw the manure. With a wheelbarrow some of the manure falls off while your loading, and some on the way to the pile—YOU CAN'T HELP IT. You ought to have our Litter Carrier Book, and see how a BT Manure Carrier saves all the tedious, disagreeable work of stable cleaning.

GET FREE BOOK

It will pay you to get our big new Carrier Book. It shows you how a BT Manure Carrier will cut your Barn Work squarely in two, and gives you complete instructions for erecting your outfit.

DE LAVAL
CREAM SEPARATORS

THOSE WHO KNOW
BUY DE LAVAL SEPARATORS

Creamerymen—Because they are experts in the handling of cream and know by long experience that the De Laval skims cleanest and wears longest. That is why 98 per cent. of the world's creameries use the De Laval exclusively.

Experienced Dairymen—The De Laval is the universal favorite among big dairymen. They know that no other separator will give them such satisfactory service.

Old De Laval Users—Whenever a man who has used an old model De Laval decides to purchase a later style machine he invariably buys another De Laval.

Men Who Investigate—If anyone takes the time to investigate the merits of the various cream separators, either by finding out from other users what kind of service their machines have given or by testing other macihnes out against the De Laval, the chances are a hundred to one that his choice will be the De Laval.

More De Laval machines are in use than any other make. There is a reason. Any De Laval Agent will tell you why or write to the nearest De Laval office below.

How I Build a Reinforced Concrete Silo

By J. H. Manchester, Sussex, N. B.

A SILO is a tank built to preserve certain crops, such as corn and clover, which can be successfully grown on the average farm, keeping them in a succulent form to be fed to all kinds of farm stock at a time, such as the winter and during the shortage of pasture in the summer months when sufficient seed of this nature is otherwise not available and without an abundance of which, stock and particularly the dairy herd can not give satisfactory financial returns.

In order to have this succulent feed at all times a silo in most cases is absolutely necessary, for although we can grow a large weight of roots per acre it is almost impossible to raise sufficient for the full season and the labor in connection with the root crop is nearly double that of handling the corn crop.

Silos are built of nearly all kinds of building material, such as slate, wood, stone or concrete, but before deciding on any particular kind it is well to consider for oneself which in his own particular case would be the best. Of course, the representatives of each make claim perfection for theirs.

I had planned on building a silo for a number of years, and considered the different makes from every standpoint and then came to the conclusion that a reinforced concrete silo had every good point claimed for other makes, and that, while the initial cost of a wooden silo might be less, the repairs that would surely follow would more than cut out the original saving, while the concrete one would never need a cent for repairs and would keep on improving.

We built our Reinforced Concrete Silo in August, 1912, using Canadian cement. It is circular, 12x30 ft., 8 in. walls, 10 of the 30 ft. below the ground with a square pitched shingled roof, built at the west end by a 30x100 stock barn. It is joined to barn by a chute 3 ft. wide, the doors from the silo opening into it, and chute door opening into gangway between two rows of cattle. There are three windows in chute on south side and windows in gable of silo roof to receive blower pipe when filling.

We used Canada cement, sand, gravel and broken stone for the floor and foundation a 1, 3, 7, mixture, for the walls 1, 2½, 4½, for finishing floor 1,2; and for painting silo inside and out 1,1. The forms were made by a local wheelright, the inner and outer rings built in four sections or quarters, were made by bolting a 1x5 in board 3 ft. long to ⅜x2 flat iron bent in a circle placed six inches from each end of board, forms to be adjusted either to tighten or loosen by nuts on a connecting bolt with endless threads.

Our mixing board, 12ft.x12ft. wasdouble boarded and level built close to the excavation. We first put on sand 2½ bbls. (by wheelbarrow means) spread it out and put on four bags cement and mixed together dry, then opened out and filled centre with water and worked it together into a paste, then put 4½ bbls. broken stoneand gravel and when stone and gravel was covered with mixture it was ready to place. After we had about 9 inches in moulds, we put in 4 strands of No. 8 coiled wire twisted together, letting it come on the outside of the vertical reinforcement which consisted of the same number of wire and placed every 30 inches, about 3 inches from the outside mould, the horizontal wires were placed every 9 inches for the first 21 feet and every 12 for the last 9 feet. Had the silo been built all above ground more steel would have been necessary for the first 20 ft. A ten quart galvanized pail was used for handling cement and we used a spade for working and keeping stones from side of forms. Four men mixed and placed concrete for each ring of 3 ft. in five hours. We left it in position for three days, before raising forms, for which we used four double blocks, one man at each. It took as long to raise form and build staging etc. as to do the actual concrete.

The only tools used were two shovels, one spade, two hoes and one wheelbarrow and when completed the silo cost me, considering the building itself, the moderate amount of $304.87 made up as follows:—

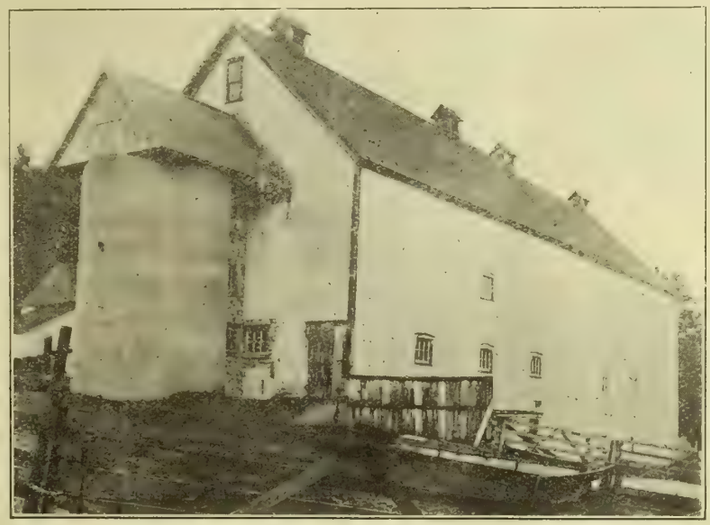
35 lbs. Canada cement, $1.95	$68.25
9 loads sand, $1.00	9.00
20 loads gravel, $1.00	20.00
4 cwt. wire, $2.60	10.40
4 windows, 2nd hand, $1.00	4.00
5 M 2in. shingles, $2.25	11.25
Boards, scantling, nails,	31.37
Labor for concrete work 256 hours at 15 cts.	39.30
Raising form and staging	39.30
Cost of form,	45.00
Excavating,	10.00
Building chute, roof and shingling	12,00
Matched 2in. pine for doors,	5.00
Total,	304.87

We had had no experience with conconcrete work, neither had we seen a silo of the kind and if any farmer wishes to undertake to build one I believe he can do so for the amount named, as we did. If we were doing the like again it is possible to cut our expenses considerably, as we have about $100.00 worth of lumber left, and the forms that cost $45.00 are as good as ever.

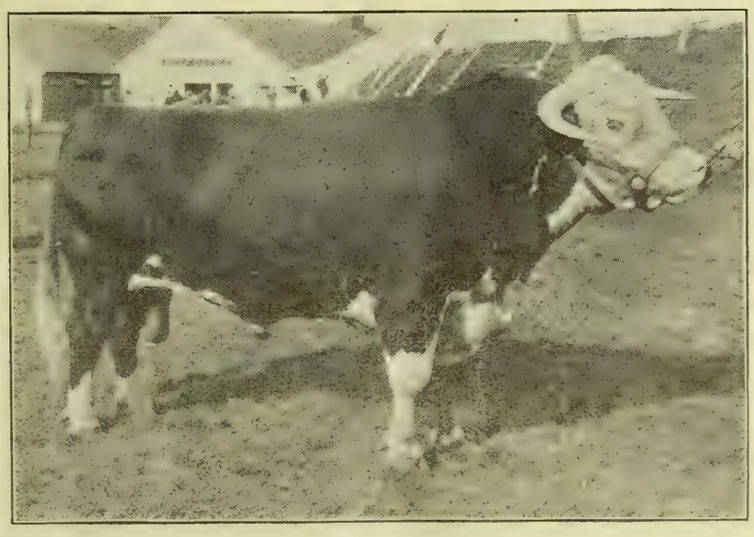
Editor's Note—Mr. Manchester has given our readers a concise statement of facts in regard to the manner in which he built his concrete silo. There are quite a number of silos in the Maritime Provinces and there is room for a great many more. Their owners find that they can carry their herds through the year much mor economically by using ensilage than they can with any other feed. Corn does exceptionally well in a great many districts in Maritime Canada and even in an off season a greater quantity of feed can be grown per acre by growing ensilage corn than can be grown from any other crop.

In order that the corn crop may be saved and fed to the best advantage it is necessary for the farmer to have a silo in which to store it.

Ensilage may be fed at all seasons of the year and is especially valuable in tiding over the seasons of short pasturage. A well filled silo is a guarantee against unsucculent rations.



J. H. Manchester's Reinforced Concrete Silo.



Hereford Bull

W. W. Black's Prize winning herd breeder

THE CARE OF MARKET EGGS.

By W. A. Brown, B.S.A., Dept. of Agriculture, Ottawa.

EGGS are a perishable food product. They do not improve with age and no amount of handling or manipulation will enhance their quality. The poor quality of the average market egg has been attributed by many persons to its retention in cold storage. This is an erroneous idea, for while the quality will not improve, yet if the eggs are full and fresh and sweet when placed in a well equipped and properly managed cold storage, there is not, during the time they are ordinarily held, sufficient change in quality to render them unfit for food.

Marked improvement has been made in the method of handling other kinds of food stuffs. The same old, antiquated methods of handling eggs that prevailed many years ago, prevail to-day. This article is a preliminary attempt to analyze the situation and point out ways and means of improvement.

EXTENT OF LOSS RESULTING FROM CARELESS METHODS.

So great is the shrinkage and loss in the egg trade and so inferior the quality of the average egg on the market, that the consumption of eggs would, no doubt, be seriously curtailed were it not for the fact that eggs are a staple in the general routine of household economy. They are prized as a high-class breakfast dish by practically everyone and are valued as a tonic, stimulant and almost perfect food for invalids, convalescents and children.

Gross neglect, carelessness, dishonesty and a general lack of appreciation of the perishable nature of an egg are causing to the Canadian egg trade a loss of several million dollars annually.

THE USUAL METHOD OF HANDLING EGGS.

Eggs under average conditions take a very circuitous course in reaching the consumer. Someone on the farm gathers the eggs whenever convenient, sometimes once a day, sometimes two or three times a week. They are carried to the house and held until such time as is convenient to take them to market. Then if the number available seems small, a hasty search, by the children, will usually reveal some hidden nests, the contents of which are added to those in the basket without question as to their condition or state of incubation.

These eggs are for the most part traded for merchandise at the country store and there, as a rule, their quality does not improve since they are often held for varying lengths of time and stored in questionable places. The egg buyer receives them next and, if working for the big packing firms, he hurries them on with all possible speed. If working for himself, he is apt to hold them, particularly on a rising market. From observation one might infer that the common carriers, the railways and the express companies are, at times, rather too prone to forget that the egg is perishable and the shell fragile, if one is to judge by their frequent lack of care in handling and in leaving them exposed to extreme heat on station platforms and in hot express cars.

Of course, there are careless dealers and commission men who allow the eggs to deteriorate in their hands, but as a whole the eggs receive better treatment in this section of trade than in any other. The dealers know that they cannot improve the quality of the individual egg any, and the large majotity of them honestly endeavor to prevent further deterioration in the shipments as received. By candling they remove the bad, the shrunken, the broken, the dirty eggs, etc., from among the good eggs, and place them in the grades where they belong. Many firms nave established regular purchase days and their buyers make regular rounds and shipments. Some firms even retain, for their own use, a number of refrigerator cars, which are dispatched regularly to receiving points. Eggs thus received are candled and some may be placed in storage. The dealer sells the eggs to the jobber or may sell direct to the retailer. As a rule, the jobber does not hold them long, and can and should improve his methods in fact may never see them.

Miss McKay

One of W. W. Black's prize winning Clydesdale mares at the 1912 Fall fairs.

The average retailer or city grocer considerably. It is business to advertise his goods, but he seems to forget that, while eggs will not melt and run away like butter or readily sour like milk or cream, they are nevertheless perishable. Many a grocer has lost good customers through unduly exposing his eggs behind a plate glass window in a heated store or by leaving them for a period of days close to a stove, a refrigerator or some other source of heat. The customer, in turn who is justly irritated at finding only eight or ten good eggs in a dozen, has no more justification than has the farmer's wife for placing the eggs on the top shelf in the kitchen cupboard, when the proper place for them is in a refrigerator or in a cellar where they will not come in contact with any mustiness, foul odors or other sources of contamination.

THE PRESENT SYSTEM OF TRADING AT THE COUNTRY STORE, CONDUCIVE TO A CONTINUATION OF CARELESS METHODS.

A great many bad eggs find their way to the market through the old-time practice of exchanging eggs for merchandise at the country store. Many a merchant would gladly give up the egg trade if he could. It places him in a very awkward position. He knows that to buy eggs is to sell goods. Therefore, it is not good bdsiness to refuse eggs and if he bids low his customer will go to his competitor across the street. He does not have the means to detect the bad eggs and some farmers knowing this take undue advantage of him. In fact the merchant has not time to candle eggs and buy on a loss-off basis, in the rush of the summer season. Many farmers put off their marketing until Saturday afternoon or evening and in the course of five or six hours the merchant may take in several thousand dozen. In the state of Kansas, where it has been made a criminal offence to offer, for sale, eggs unfit for food and the dealers have agreed to buy on a loss-off basis only, the country merchants have had a very good excuse for relinquishing their share in the trade. The eggs now go direct to the dealers and the result is a marked improvement in quality.

THE RESULTS OF LACK OF CARE

In order to secure some evidence on the lack of care, the resultant losses, causes of loss and the distribution of same throughout the year, a series of questions were sent out to over two hundred egg dealers in Canada. The first question was:—

"With reference to your own experience, do you consider the suggested figure of seventeen per cent for total shrinnage too high."

The answer from those engaged in handling eggs, direct from the farm or the country store, has been invariably "No" and some have indicated that the figure is not high enough. In fact the sum total of the estimates given in the subsequent pages slightly exceeds seventeen per cent.

I.—The Loss Through the Sale of Heated Eggs or in which the Germ has Commenced to Grow.—As a result of the heating of fertile eggs, from four to six per cent. of all eggs marketed are unfit for human food. A temperature of 70 degrees F. or a little higher will start the germ to grow. The greatest loss is apparent between the months of June and September although such eggs are often held until later.

In nature the purpose of an egg is to hatch a chick, but when man intends an egg for food he should aim to defeat that purpose. He must distinguish between an egg for hatching and an egg for market and eliminate the fertile eggs from the marketable product by excluding the male bird from the pen at all times except during the breeding season.

II.—The Loss Through the Sale of Shrunken, Held and Stale Eggs.—Sixty-five per cent of the contents of an egg is water; the shell is porous and evaporation takes place whenever the egg is surrounded by a temperature above freezing. The higher the temperature and the more rapid the air circulation, the greater will be the evaporation.

An egg will grow stale in the nest, if the house is hot and ill-ventilated or if broody and other hens sit on it. The water content will evaporate just as readily in the consumer's cupboard as in the farmer's kitchen and the country merchant has no right to keep his eggs near the stove than the city grocer has to place his behind the plate glass window.

Eggs in cold storage are held at a temperature of about 30 degrees and the fact that the average merchant or buyer has not similar facilities is ample reason why the eggs should not be held. Notwithstanding this, however, the practice of holding eggs for higher prices is so common that a shrinkage of not less than five per cent results. This is most apparent in the fall months, but has to be taken seriously into account from June until January inclusive.

III.—The Loss from the Sale of Rotten Eggs.—Rotten eggs like rotten apples find their way into the trade. They are not so readily detected, however, and for this reason are even a more serious menace. Common rots are the result of decomposition. The germ dies in a fertile egg. And under certain conditions rapid decomposition takes place and hydrogen sulphide gas is liberated. Eliminate the fertile egg and this repulsive form of loss will disappear.

Other forms of rotten eggs occur. The albumen of an egg constitutes an excellent culture medium for the growth of bacteria. An egg is moist when laid, and in the foul, unsanitary condition of many nests readily becomes infected. The porous shell offers little or no restance. The tough inner membrabe is, however, practically bacteria proof unless brought in contact with excessive dampness or even exposed to moist conditions for some length of time. It is for this and other reasons that interested dealers send out the instructions, "Under no conditions wash eggs." If a washed egg is placed in the consumer's hands without delay little trouble may result; but if the bacteria once enters into the albumen of an egg and that egg is held and exposed to conditions of moisture and warmth favorable to bacterial development, the different forms of spot rot readily appear. Some continue to grow even in the low temperature of a cold storage house. About three per cent. of all the eggs are discarded on account of loss in some form and the loss is apparent throughout the year, with the exception, possibly, of the months of March and April.

IV.—The Loss Due to Breakage.—Broken eggs are found in all sections of the trade. Accidents will occur, but carelessness and thoughtlessness account for a great deal of the breakage.

Broken eggs are known to the trade as leakers, dents or checks (blind checks). Leakers are not only a loss in themselves but they produce smeared eggs. Dents are eggs in which the shell is broken, but in which there is

no rupture of the inner membrane apparent. Blind checks are the faint cracks not readily apparent to the eye. They are only detected by the use of the candle or by clinking two eggs together.

Many eggs are broken in transit either through the jolting of loose or poorly packed eggs over the rough country roads or through careless handling by the cartage and express companies. Broken eggs, no matter how slight the break, should not be placed in any egg case intended for shipment. They not only constitute a loss themselves, but they soil the fillers and make them unfit for future use. At least three per cent. of all eggs marketed show breakage in some form and broken eggs are apparent at all seasons of the year, particularly in the spring.

V.—Loss and Shrinkage Through the Sale of Dirty Eggs.—Dirty eggs are of three kinds:—

1.—Plain dirties, those to which soil and manure adhere.

2.—Stained eggs, i. e. dirty eggs that have been washed.

3.—Smeared eggs, those that become covered with the contents of broken eggs.

The producer is largely to blame for the first two classes of dirty eggs. A dirty egg is a disgrace to the person who sells it. The hen should not

Albert Boswall, Sr.

"The Noted Shepherd." Pownal, P. E. I.

be blamed for the appearance of dirty eggs. They almost invariably lay clean eggs and they prefer to lay them in clean, cool places.

Dirty eggs should never be marketed. They are repulsive to the trade and they seriously detract from the appearance of good eggs and cause the entire shipment to sell at a lower price. This may not be apparent at the country store where severe competition forces the merchant to take all or lose a customer, but the dealer is obliged at considerable expense, to remove most of them and must therefore discount the price he pays accordingly.

It is not wise to wash market eggs. Washing removes the natural bloom and gloss and makes the eggs appear old and stale. Clean nests should be provided, thereby reducing the number of dirty eggs to the minimum. About three per cent. of all eggs marketed show contamination and it is particularly apparent in the wet seasons, spring and fall.

VI.—Loss Due to the Sale of Mouldy and Bad Flavored Eggs.—So readily do eggs absorb odors that in the early days of artificial refrigeration many packers incurred heavy financial loss through having stored their eggs in chambers containing citrous fruits, etc. In all modern cold storage houses large separate rooms are provided in which eggs alone are stored.

Musty eggs are very common, due no doubt to their having been collected in pails or baskets containing damp, musty straw or litter or to their having been placed in egg cases containing old, soiled fillers. Eggs are often held in damp, musty cellars where decaying vegetables, kerosene, etc., are also stored. The different forms of mould appear in eggs just as in cheese and, while desirable in the one, are repulsive in the other. Care should be taken to eliminate all possible source of contamination in this way. It is difficult to estimate the amount of loss caused by the above stated factors because they influence the flavor rather more than the appearance and as such their effect is not apparent until the eggs are consumed. Dealers estimate that at least one per cent of all eggs are affected in this way, but the experience of the housewife indicates that this figure should be much higher.

VII.—Loss from Frosted Eggs.—While it is unfortunate that only a small proportion of farm hens lay in the winter, it is even more so that a large percentage of these eggs are allowed to become frosted. Frozen eggs are not only undesirable in themselves, but when they thaw they often, through leakage cause smeared eggs. Frozen eggs and dirty eggs should be kept at home.

VIII.—Loss from the Sale of Small Eggs.—Some small eggs will no doubt always be produced, but there is no excuse for the large percentage found on the market at the present time. Pullets, commencing to lay, produce small eggs at first and old hens at the moulting time are prone to do likewise. The great majority af small eggs, however, come from the mongrel, nondscript, stunted stock found on such a large proportion of our farms. Some of the small sized, light weight, pure bred stock is undesirable for the same reason. Eggs ought to weigh a pound and a half to the dozen or forty-five pounds, net, to the thirty dozen case. No figures are available at the present time to indicate the percentage of small eggs that are marketed, but anyone who has had experience in the egg trade must readily appreciate the extent of this difficulty.

SUGGESTIONS FOR GENERAL IMPROVEMENT IN METHODS FOLLOWED ON THE FARM.

It is evident from the foregoing discussion that, while all parties engaged in the egg trade are more or less to blame for the present lack of quality, yet the conclusions reached from our inquiry indicate that the great difficulty centres about the methods employed in handling eggs on the farm. Present conditions surrounding the production and marketing of farm eggs show distinct evidences of lack of care and appreciation of the fundamental considerations underlying the trade and, while it is the intention later, to point out some specific instances in which all can make improvement, the following suggestions deal directly with general conditions on the farm:—

1.—Keep only pure bred stock of the larger general purpose varieties.

2.—Discard all stunted, nondscript and all diseased stock.

3.—Give the poultry-house a thorough cleaning every spring and keep it clean; spray often, and whitewash walls, roosts, etc., regularly.

4.—Feed the flock on pure and wholesome food and provide pure water in clean utensils.

5.—Hatch the chickens early; keep them separate from the old stock and give them every opportunity to grow into strong, healthy, vigorous, well matured birds before the cold weather comes, in the fall and early winter.

6.—Give the poultry the care and attention they deserve and, if the farmer has not the time or inclination to do the work himself, let him delegate it to some responsible member of his family.

SPECIFIC SUGGESTIOES IN REGARD TO THE PROPER CARE OF MARKET EGGS.

To the Farmer.—Remove the male birds from the flock immediately after the breeding season and market no fertile eggs.

Provide roomy nests and plenty of clean nesting material, preferably dry shavings or cut hay.

Keep the nests clean and sanitary.

Collect the eggs at least once, better twice, a day in moderate weather and more frequently in very warm and very cold weather.

Remove at once in clean utensils to a cool, dry cellar.

Cover with clean cloth to prevent dust from settling upon them and also to prevent evaporation and fading.

Do not pack loose in a box when taking them to market, but rather secure a suitable egg case and thus avoid breakage.

Market as frequently and as directly as possible.

To the Merchant.—Buy on a loss-off basis, if possible, and encourage other merchants to do the same.

Insist that the farmers furnish first quality eggs only.

Keep in mind the perishable natute of the product and do not hold eggs on a rising market without proper facilities for storing them.

Realize that fresh eggs at any season of the year are much more valuable than stale eggs, when prices are higher.

When shipping, pack carefully in strong, clean fillers.

To the Egg-Buyer.—If buying direct from the farmer, make regular and frequent collections.

Pay a premium for quality and do not hesitate to condemn bad, dirty, small and broken eggs.

Encourage the farmer to keep better poultry and more of it.

If buying from the country merchant, encourage frequent shipments and if possible buy on a quality basis.

To the Railway and Express Companies.—Handle eggs with care.

Provide suitable accomodation.

Guard against undue exposure to heat and cold.

Deliver with all reasonable dispatch to the consignee.

To the Dealers and Packers.—Indicate to the producer that financially, quality counts for more than quantity.

Adopt without delay a basis of "quality payment." The system of "average payment" on a case count basis permits of a great deal of the carelessness and dishonesty that exists in the egg trade.

If the packers were to adopt the method of "quality payment" in its fullest sense the store-keepers and collectors could not afford to take eggs from producers regardless of quality.

To the Retailer.—Buy eggs of assured good quality. If it is necessary to handle inferior eggs, sell them for what they are.

Encourage producers to forward their shipments direct.

Establish if possible, a brand of eggs, which will, in itself be a guarantee of good quality.

Every city retailer must realize how quickly the buying public of the better class proportions its consumption of eggs to the quality of the product. In fact, there is hardly any class of consumers, however careless, but which will increase consumption when the product is improved.

To the Consumer.—Demand new laid eggs of good size and colour.

Insist that they be clean.

Learn to distinguish between a new laid egg and a stale egg; a fresh egg and a storage egg.

If bad eggs are furnished, demand retribution.

Be willing to pay a premium for good eggs.

Having purchased eggs do not overlook their perishable nature and give them proper care.

Many consumers use the product of poor, unhealthy stock, kept in unsanitary surroundings rather than pay a cent or two more for clean, wholesome eggs. This is a direct bid for poor eggs.

The responsibility for present conditions rests in part therefore with the consumer and the whole trade will reap the benefit when the latter insists that he be supplied with nothing but first class eggs.

CONCLUSION.

Improvement in the care of eggs is important from a financial point of view; in fact it is a business proposition. There is an enormous financial waste resulting not only from the absolute loss of thousands of dozens and the shrinkage in millions of others, but also from the cost of handling, packing and transporting so much worthless or practicly worthless product. If the manufacturers and business men in Canada

Geo. L. Boswall

One of the men who is making a success of Sheep Breeding." French Fort, P. E. I.

were to take no more care of the articles manufactured by them and no more pains in advertising and in placing first quality goods on the market, than is taken by farmers in handling aad marketing eggs; now long would the average business be prosperous?

As a result of an investigation of the egg industry in the state of Kansas, seventy-four buyers, handling over nine hundred thousand cases of eggs annually, state that if the farmers of the State of Kansas would deliver eggs to the buyers in first class cindition, they could pay two cents a dozen more the year round. Even greater advances have been made by Canadian dealers to the members of Egg circles in the Province of Ontario.

It is deplorable that a product, like eggs, so uniform when produced, in quality and composition, is allowed to deteriorate so seriously through gross neglect, carelessness and a lack of appreciation of its perishable nature.

It is evident that, if the eggs are to reach the consumer's table in a fresh and palatable condition, the present antiquated system of handling and marketing them will have to be largely discontinued and more modern business-like methods adopted.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

SUCCESSFUL FARM STORIES

We know that there are a good many of the average farmers of the Maritime Provinces who are carrying on a successful farming business, making good homes and a ssuccess of their lives. We know also that there are a good many farmers wno are just getting along and would welcome a release from an agricultural life and labor. There are many others who have left the farm, or who have perhaps been brought up in the city, who would like to work and live in the country, if they could only believe that the farm would afford them any of the pleasures, comforts and luxuries of life which they believe they have been having in the city.

It is for the benefit of these who would leave the farm and these who would leave the city if they dared that we delight to print these stories of profitable and pleasant farming. It is perhaps more especially for the benefit of those who are not making a success of their farming that we like to print these stories of the accomplishment of agricultural results, for they show what may be done, and we hope in some small measure they show how things may be done. What one farmer can accomplish and does accomplish. others may accomplish.

We need to keep the men and women who are now on the farm more than we need to bring others out from the cities to the farms. We need to keep the boys and the girls upon the farms, and it is right that we should tell them of the possibilities of accomplishment upon the farm; of the results that others have obtained; of the kind of farming that some of their neighbors are doing.

SUCCESS BREEDS SUCCESS

We have printed from time to time in the columns of the Maritime Farmer such stories of successful and enterprising farming as we are able to discover and investigate in the Maritime Provinces, we have purposely made it possible for it to be said that we have selected only from the instances of best farming. It may be said truly that we have chosen to tell only of the successful farming enterprises, the profitable and satisfactory farm businesses; that we have purposely avoided telling about the failures in farming; and perhaps some will say that this is not right, because it has made the farming business appear too prosperous, too successful and too felicitious; much more so than it really is.

We believe, however, that we have done just the right thing in telling about the prosperous and thriving farmers, and neglecting to tell about those who have made a failure of the business for various reasons and are ready to quit the business and go to the city or to the West. We know that there are too many failures in the business of farming, too many instances of poor, unsatisfactory and unsuccessful farming We have not neglected to tell about the trials and difficulties in the business of farming, but we need to be told of the possibilities of accomplishment in agriculture, stock raising, fruit culture, dairying, the poultry business, and all the other departments of farming, more than about the failures, the difficulties, the hindrances to success.

The readers of the Maritime Farmer will notice that most of our stories of successful farmers and good farming are descriptions of the moderate-sized farms of the provinces, of the average farmers rather than the big fancy farms. It is the average and small farm that the Maritime Farmer is most interested in because there are more of them than of any other sort, and it is in their improvement that it is most needed for the good of the farming business of the whole state.

We are most certainly interested also in the big farms where the business of raising stock or crops is carried on on a large scale, for they show how successful the business of farming can be made. The degree of success which may be attained in any business, however, is not measured by the size nor the amount of business done; nor is it necessarily measured entirely by the degree of profits gained. Success is not necessarily one thing nor another. A man may have money in the bank and still not be a successful farmer, while another may have achieved splendid success and still be the part owner of a mortgaged farm.

We are interested even in the fancy farms, where men of wealth farm for amusement or for personal satisfaction. We are interested in farms of this sort because they are often valuable object lessons of what may be accomplished, not necessarily by the expenditure of a good deal of money simply but by scientific cultivation and by wise and judicious operation.

RESULTS THAT COUNT

We need enterprising and brainy boys and girls upon the farm, the kind of boys and girls who are looking for opportunities in life. If they can be shown that the farm offers opportunities, we need have no fear of their leaving. It is not hard work that drives the boys and girls away from the farm so much as the lack pf opportunity to accomplish in the present and lack of a vision of results in the future.

As we have said before, the Maritime Farmer is not only willing but anxious to print all the stories of successful farming achievement that we can secure, and will be glad to receive them from anyone who may be able to secure the necessary information—stories of general farming; of good crop raising; of excellent stock and profitable stock raising; of special enterprise.

We will be glad to receive from any farmer a description of any good thing that his farm has produced and his method of producing it; of the results of his dairy work, of his hog raising or sheep growing; of the egg-laying records of his poultry. We shall be glad to use all such reports as these which may be of interest to other farmers. The mere telling of what some have accomplished is likely to be the means of encouraging others to better efforts and larger achievements.

FOR A MARITIME AGRIDULTURAL COLLEGE

At the Maritime Stock Breeders Association banquet held on Monday night of the Winter Fair week, we are pleased to hear the Premiers of New Brunswick and Prince Edward Island express themselves as being very much in favor of Maritime union so far as the maintainance of a college of agriculture is concerned. They expressed their views that while they deemed it advisable to open agricultural schools and short courses in their respective provinces, it was their intention that these schools and courses would act as feeders to the N. S. A. C. at Truro. We trust that ere long something more tangible than mere expressions will be made to bring about the establishment of a Maritime Agricultural College.

FOR BETTER ROADS

Realizing the benefits accruing to all country districts through the building and maintenance of good roads, the executive of the Nova Scotia Agricultural College has decided to add a coarse of instruction in road building to the curriculum of the Short Courses, which will be held at Truro, N. S. from January 7th to 17th, 1912.

One of the crying needs of the day is for good wagon roads evesywhere. The tax imposed on the farmers through the wear and tear to their machinery and teams by roads, which even in the most favorable seasons are no better than they ought to be, is the heaviest tax they pay.

Time is money and every extra hour that the farmer and his team are obliged to spend on the road, because the physical conditions of the road do not permit him to travel faster is a great drain on his resources.

We need better roads in order to make the fullest use of the rural mail delivery.
rural mail delivery.

Consolidated schools will not be the success they were destined to be until our roads are in a less objectionable condition for fast travel.

Social life on the farm will not be at its flood tide until our roads are the best that can be made with the material and means at our disposal.

Bad roads are not conducive to social life, better schools, live churches, pleasant rides, good markets—in fact, bad roads are not infrequently driving, directly and indirectly, the cream of the country out of the country—the very class of people we wish to retain—the class of people whose presence in a country district means the upbuilding of everything that tends to good citizenship.

We hear a great deal of the cry "back to the land." But the cry falls on deaf ears, because the people who have left the rural districts for very definite reasons. Restore or create in the country the congenial conditions that are being sought in town and the population will very soon go back of its own accord.

Just as water seeks its level, so a free people seek those conditions and environments that suit them best.

Good wagon roads are more essential to the country than river and harbor improvement that not infrequently has been a "pork barrel" proposition for the good of the few.

We have the material and labor necessary for the building and maintenance of good roads, but too often, through lack of "know how" on the part af the persons in charge of the work both material and labor is misapplied. Too often we see men in charge of road making who do not possess the most elementary rudiments of mechanical ingenuity—men who allow their own work to run at loose ends. The best available, mechanically inclined men in the district should have charge of the roads and then both material and labor would be economically utilized.

The lectures on road making at the College Short Courses means the insertion of the thin end of the wedge that will be the means of bettering our road conditions. We trust many of our young men will take advantage of the training opportunity thus offered.

NOTES

Prof Landells of the N. S. A. C. was kept busy at his booth at the Maritime Winter Fair answering questions re Land Drainage. The college is doing a grand work in interesting farmers in the proper drainage of their farm lands.

The wool exhibit made by the Dominion Live Stock Department, at the Maritime Winter Fair, was a feature that interested a great many of the visitors. Every kind of wool from the very finest quality to the coarsest kinds and various kinds of wool fibre and silk were on exhibition and Messrs. Telfer and Arkell were always on hand to answer questions.

Christmas is again with us and the New Year will soon be here. We trust the good old year has brought our readers a fair share of prosperity and that the new year, 1913, may further crown with success the efforts of the industrious. The New Year season is generally the season for making new resolutions. Make a resolution right now to attend the Short Courses at the N. S. A. C on January 7th to the 17th, 1913.

The Maritime Farmer wishes all its readers and patrons a Happy and Prosperous New Year.

Agricultural Matters in the Ancient Colony

While on a recent visit to Newfoundland the Editor of the Maritime Farmer had the pleasure of meeting not a few of the Ancient Colony's agricultural enthusiasts.

The St. John's Agricultural Board is at the head of matters agricultural. The various agricultural societies are doing ground work in assisting the farmers of their respective districts to overcome some of the difficulties with which they are confronted.

While at Harbor Grace we met the men who are so successfully carrying on the good work in their district.

A year or two ago our readers may have noticed in the press that the Potato Canker Disease had put in an appearance in Newfoundland and it was only less than a year ago that the Dominion Department of Agriculture sent out warning bulletins and posters throughout Canada warning the people against planting potatoes that had been imported from Great Britain as they had been found to be, in some cases, seriously infected with the disease.

Every effort is being made to prevent Canadian Soil from becoming infested with the germs of this disease. Once the disease gets a foothold it is no easy matter to stamp it out. In order that this may be accomplished it is necessary that there be united efforts.

Some of our Newfoundland friends are alive to the gravity of the situation in their Island Colony and as will be seen by the following rhyme and paragraphs from the columns of the Harbor Grace Standard the members of the Harbor Grace Agricultural Society are going to unite their efforts in eradicating the disease and are seeking the assistance of the Newfoundland Agricultural Board—an assistance which we sincerely trust will be forth coming. Every good minded citizen of the Colony should join in the fight—it means dollars and cents to the present generation and to generations yet unborn.

The Potato Canker Fight.

Arise, ye that grow the potato,
And fight the deadly Rot.
That dreadful plague, the Canker,
A hold on the crop has got.

CHORUS:

Will you yield, or will you fight it?
Say, are you that way built?

Like many another evil,
Its beginning is but small;
But the havoc it can render
The boldest must appal.
Chorus: Will you yield, etc.

Its thousand tiny seedlets
Spread the disease like mad,
And if it gathers headway
'Twill be very very bad.
Chorus: Will you yield, etc.

'Twill spread all o'er the country,
'Twill ruin the potato crop,
You must fight it now or never,
If you'd its ravage stop.
Chorus: Will you yield, etc.

Notice the eyes all warty
Which bigger, bigger grow,
And change the spuds to shapeless lumps
Which soft and rotten go.
Chorus: Will you yield, etc.

Don't throw the stuff out careless,
Don't sell a single one,
If you feed them to your cattle,
Thru manure the harm is done.
Chorus: Will you yield, etc.

Delay not a single minute,
A sample send to the Board,
Who'll send a man to help you,
To destroy the dangerous hoard.
Chorus: Will you yield, etc.

Destroy stalk, root and tuber,
Wipe even the dust from your feet,
For fear you'd spread infection,
You've a foe that's hard to beat.
Chorus: Will you yield, etc.

Don't plant any more potatoes.
In that ground at least six years,
Other crops may be sown in safety,
And you be free from fears.
Chorus: Will you yield, etc.

You'll be paid for your lost potatoes,
Have a conscience free from guilt.
Will you yield, or will you fight it,
Say, are you that way built?
Chorus: Will you yield, etc.
Potato Grower in Harbor Grace Standard.

The Potato Canker Peril.

We had prepared an article for insertion in this issue lamenting the loose dealing on the part of the agricultural authorities and people generally with respect to the Potato Canker, and urging that steps be taken to find out the extent of the plague, and to take thorough-going measures to deal with it. Since that the Agricultura' Society here at its meeting on Monday last which we attended, appointed Mr. H. H. Archibald, its president, and Mr. John Tapp to proceed forwith to St. John's to interview the Government on this matter of immense importance. They have not yet returned. We trust, however, that their representations of the grave need of sparing neither pains nor money in endeavor to arrest its progress will be attended with complete success before it obtains a firmer foothold. Even now, it will be a tough task to exterminate it. What will it be if left unattacked longer? The disease is insidiously making progress. Other countries are exerting gigantic efforts and spending thousands upon thousands of dollars to root it out. We are doing very little effectively. In this neighborhood our Society has done more than we think any other society or community has done; but it needs a government in arms to grapple with this peril, as we have repeatedly warned. We summarize today as much as possible of the law on the subject, which with the regulations that we trust His Excellency in Council has made or will immediately make, will bring into force and which should be published widespread.

The Government by the Potato Act of March 29th, 1911 has power to make regulations, of which those affecting growers of potatoes are mainly these:

It has power (a) to prevent anyone removing infected potatoes from his premises or from any one place to any other; (b) to prohibit their sale; (c) to confiscate them or any container of them; (d) to grant compensation for any potatoes and the container destroyed to the extent of two-thirds of their value; (e) to require that the occupier of any premises on which is discovered potato canker to forthwith notify the Minister of Agriculture and send samples to him.

Every person contravening these and other regulations to be liable to a penalty of $100 or less or to 6 months' imprisonment or less, or to both fine and imprisonment.

We hope all persons having canker in any potatoes they have in their possession will attend to section (e). We have no doubt our Agricultural Societies or any public functionary would be ready to assist them. The Government would do well to send a person around the fields in any section where canker exists with full power to help the people to carry out the law.—Harbor Grace Standard.

Practical Agricultural Chemistry.

"The achemist of old tried in his mysterious ways to produce gold from the elements; the modern scientist points out the way for every farmer to produce gold. The chemist takes into his laboratory the soils from the fields and analyses them; he learns what elements the fertile fields contain—what elements are present to make them productive. He also leaens that elements of fertility are lacking or are present in small quantities only in the fields which produce small crops. He finds that by supplying the missing or deficient elements a fertile and well balanced soil may be made; that the four elements most likely to be lacking are phosphorus, potassium, calcium (lime), and nitrogen.

"The phosphorus, if deficient should be supplied in the form of steamed bonemeal or ground rock phosphate, the potassium in the form of kainit or some other of its commercial forms, the calcium in the form of ground limestone, while the nitrogen may be obtained through the application of barnyard manure, or from the air through the proper use of the legumes. To buy a complete commercial fertilizer is on a par with giving a sick animal a shotgun dose of all the remedies in the office when the doctor does not know what the trouble is. Common sense and economy would seem to require that when the soil is sick the sickness should be properly diagnosed and only the needed remedy applied.

"The chemist takes into his laboratory animal tissue; through inspection he finds that some is fat and some is lean while the bone is of a composition quite unlike either. He analyzes the various parts and finds that the fat meat contains larger quantities of carbon and he calls its carbohydrate. The lean meat contains large quantities of nitrogen and he designates it as nitrogenous. He finds that bone contains large quantities of calcium or lime. He analyses wheat, oats, barley, timothy hay, clover and oilmeal. He also analyses corn, for corn is king, and alfalfa because alfalfa is one of nature's best gifts to man. He finds that these products contain varying amounts of nitrogenous and carbohydrate elements, some rich in one and some the other. The ratio between the nitrogenous elements and the carbohydrates he calls nutritive ratio.

"The chemist found that timothy hay had a nutritive ratio of 1 to 20 —that is in simple terms, one part of the leans to 20 parts of the fats. He found that corn has a nutritive ratio of 1 to 10 and that alfalfa has a ratio of 1 to 3.5. By experiment and observation the chemist found that young animals fed on timothy hay and corn, or any ration containing large quantities of carbohydrates exclusively, do not do well; so too, an animal fed entirely on oilmeal or alfalfa hay did not do well because of the excess of nitrogen. He found that somewhere between these two extremes there is a happy medium which he called a balanced ration.

"The chemist found by investigation that for most young animals a ration containing 1 part of the nitrogenous elements to 6 of the carbohydrates made a balanced ration, or a nutritive ratio of 1 to 6 gave the most satisfactory results. He also found that when an animal was fed on a ration with a nutritive ratio of 1 to 10, when its system required a food ration of 1 to 6, the difference between 6 parts and 10 parts of carbohydrates was wasted. It is evident then, that when a horse is fed corn which has a ratio of 1 to 10, and timothy hay which has a ratio of 1 to 20, while its system requires a food ratio of 1 to 6, the waste must be enormous.

"Many good farmers who feed carefully so there is no apparent waste at the manger or on the feeding floor are wasting much of their feed because of its not being balanced. The extravagant waste of material fed carelessly by boys and hired men— feed tramped in the mud at the feed rack—is not one-hundredth part of the waste caused by feeding an unbalanced ration.

Feeding the Soil Through Dairy Cows.

Of all animals kept on the farm the dairy cow is the most eminent. She is the farmer's highest trump card in build up the fertility of the soil. Many eastern dairymen have attempted to set the milk producing end of the business over against the crop growing end and from the unwelcome results have come the growing recognition of the fact that plant and animals—dairy cows and grain and forage cross—are economically inseparable. In its best estate the dairy farm produces the food for the cows. One cannot neglect the growing of forage and grain crops and find his largest returns through a highly specialized dairy business.

The greatest question before the dairy farmer today is that of growing suitable food crops and its reciprocal effect upon the fertility of his farm. The great need of a wider growth of forage crops is shown by the present tendency toward the depletion of available fertility. In many cases we are growing too little and buying too much, both of feed and fertility.

Many dairymen buy tons of commercial feehstuffs, not to supplement but to piece out the home-grown supply. To buy feeds which will balance up the deficiency of protein in the home-grown supply is entirely proper, providing the right kind is purchased. Feeds like cottonseed meal, oil meal and gluten which possess a high fertilizing value are the real supplements as they usually supply the compounds that are deficient on dairy farms.

Soils must be fed a balanced ration in order to yield large crops. Variety is relished by soils as well as by animals. The growing of dairy foods compels crop rotation. The legumes, clover, alfalfa and cowpeas figure prominently in the best dairy rations and are valuable when grown in rotation with other farm crops. Having the ability to take their nitrogen supply from the air they not only furnish highly nutritious hay and pasturage for the cattle, but at the same time they supply nitrogen to the soil.

By growing these crops in rotation with corn, oats and field peas and converting them into dairy products, it is possible to retard more than two-thirds of the plant food removed by these crops to the soil. This solves the nitrogen problem.

Stable manure and the roots and stubble of the legume and grain crops turned under will liberate sufficient potassium. Phosphorus is the one element that is likely to be deficient. It is supplied in limited quantities by stable manure, but that source is inadequate. Acid phosphate mixed with manure before it is applied will make up the deficiency on this element. Its use pays handsomely on the average dairy farm.

If we are going to raise a large proportion of our feed it is necessary that we adopt a short system of crop rotation and follow it up year after year. Roots, clover and timothy, oats and peas and perhaps a cash crop, make an ideal rotation to supply food for the cows and leave a balance to buy supplemented feeds with. In this way a man can run his herd well through the year without buying very much grain, and that only of the most concentrated sort. We must follow up this system, and if one crop fails put in another. If we can get started with alfalfa, all the better.

HORTICULTURE.

Nova Scotian Apples

There are still in our midst some venerable folk who remember the days when apples were scarce in the winter. A few home grown specimens were carefully put away in the fruit room, and used with ever increasing economy as the season advanced. But even with the greatest parsimony they could not be made to last from one year to another, and at length there came the time when apples were not only out of season, but unobtainable. Such a state of affairs nowadays is gltogether unthinkable. Apples are always with us, and the public do not stop to consider such barriers as the season, which in regard to supplies may be said not to exist.

Evidently the British have earned a reputation as lovers of the apple, otherwise the growers in the great producing districts would not study so carefully the conditions that rule our markets. Canada, American, and the Australasian Continent cultivate apples on an enormous scale, and it is quite obvious all have the same objective—the British demand. Production is ever on the increase, and to judge by the present state of affairs it will be necessary before long for the entire populace to eat large quantities of apples daily if the fruit is to be consumed.

New districts develop with astounding rapidity. At first they send a few sample boxes of apples by way of experiment, to try the carrying quality of the fruit, and to see what kind of a reception it meets with on this side. Of course, a new fruitarian venture on a small scale is always successful; satisfactory prices are realized and lo! and behold, next year the fresh district consigns its thousands of packages to the ever open market. Even with strict adherence to the old and familiar saying "An apple a day," modern shipments would tax the powers of the most vigorous pomaceous appetites.

ANNAPOLIS VALLEY.

In the midst of so many modern ventures it seems a pity to ignore the older ones, especially when they are still useful and fulfil the same objects as of yore. With a continuous stream of novelties people are apt to let pass unnoticed the work of some of the best contributors to our comforts. Thus it has been with Nova Scotia, a region to which all British fruit lovers owe a debt of gratitude. California, Oregon, and Wenatche have monopolized the attention of those who chronicle matters connected with apple supplies. Even in this weekly column it is four years since the Colony has received any but passing notice, and it is, indeed, time to make amends.

Whilst other places having been going ahead it must not be assumed Nova Scotia has stood still. The infectious habit of "hustling" spreads rapidly on the other side of the Atlantic, and the Nova Scotians have all the while been improving the cultivation, grading, packing, and marketing of apules. Mr. J. N. Chute, the representative in England of the United Fruit Companies in Nova Scotia, reports great progress in all directions since the formation of the first co-operative association founded at Berwick in 1907. Before dilating upon the headway that has been made, it is as well to state that the famous apple growing district of Nova Scotia is known as the Annapolis Valley, which is a continuation of the Valley of Annapolis, Cornwallis, Gaspereau and Windsor. This territory about 100 miles long, varies in breadth from six to ten miles, and is very favorably situated between the North and South Mountains, two parallel ranges that afford excellent shelter to the fruit trees.

"THE OLD ORDER CHANGETH"

Although apples have been grown in that part of the world for close upon two centuries, the commercial part of the enterprise is comparatively modern. Thirty-two years ago there was great rejoicing because the exports had exceeded 41,000 barrels. Last year the yield all but reached 2,000,000 barrels. Quantities, of course, cannot be regulated closely, Nature still being triumphant over the best efforts of man, but the conduct of the industry can and has been improved in most marked manner during the past ten years, more especially since the co-operative system has gained ground. At one time anything that had grown on a tree was considered good enough to ship to England, provided the best fruit was always on the top layer. It is easy to understand that such ill-considered practices do not rank even as clever roguery, the fraud being palpable and easily discovered.

Very soon it was realized that for the Nova Scotain apple industry to be prosperous the work must be condurted on straightforward and honest lines. In other words the top layer of fruit shall be a fair indication of the entire contents of the barrel, and not a mere decoy for the unwary and inexperienced purchaser. A Fruit Marks Act was passed, with the result that genuine packing took the place of false and careless methods, and confidence in the Colonial fruit was quickly established. That was the first move in the right direction, and any more have followed since a large number of growers have joined forces. The association known as the United Fruit Companies handles about half the entire output of Nova Scotian orchards, and has done more than legislation to improve the lot of the grower, and, incidentally, to satisfy the consumer.

STORAGE AND CO-OPERATION.

Belonging to the association are frost proof warehouses for storing the fruit during the cold season—10 deg. below zero not being an uncommon occurence in those parts. In former days farmers who were not possessed of sufficient means to build these warehouses (at a cost of about $3,000 each) were compelled to sell their fruit to local speculators, astute gentlemen, who took special care to leave an ample margin of profit for themselves, even assuming the market to be unfavorable in England. To do away with the unnecessary middleman there arose the twenty-nine associations now merged into the one company, which, by the way, must not be confused with the United Fruit Company of Boston, that vast and wealthy organization which provides Europe with bananas and Jamaica oranges.

London is the chief market for Nova Scotia apples, and for many years it has fallen to the lot of the Colony to provide cheap and good varieties for the middle classes and the poor of the capital. It has been said of the poor that they do not make new friends. Well, in regard to apple supplies they want no better friend than Nova Scotia, especially since the co-operative system of marketing has been worked with such good efffect. Growers send their fruit loosely packed to one of the association's depots. Upon arrival it is standardised and sorted into "ones" "twos" and "threes"—the chief grades used to designate the size and quality of the fruit. There are also "fancy" and "extra fancy" apples for specially fine lots. Fruit deemed unsuitable for shipment is set aside; the rejected ones being described as "culls." Growers receive no credit, financial or otherwise, for any apple sent to the packing house which are ranked among the unworthy.

FAVOURABLE CONDITIONS.

Apple warehouses in Nova Scotia are visited by Government inspectors, but the standard of work required by those who examine on behalf of the company is higher than that insisted upon by the official of the law. So universal is the confidence in the work of the co-operative body that fully 30,000 barrels of apples were sold this season before the fruit had been gathered. It was guaranteed to be in accordance with the company's rules of grading and packing, and that was sufficient. In all the important centres there are foremen and export packers, who watch carefully the entire process of preparing fruit for shipment. Orchard requisites, which include spraying materials, are provided, and the fruit is tended in every possible way. Every grower is compelled to subscribe at least $100 capital sum to his local association.

Many are the advantages over other apple growing districts claimed by Nova Scotia. Farmers are enabled not only to produce, but also to despatch more cheaply than in America. Land costs about one-fifth of the money demanded in the Western and North-Western States of America, and a farm labourer will work for 5s to 6s a hay, as opposed to 8s paid in the United States. Furthermore, the apple growing districts of Nova Scotia are conveniently situated, being within 100 miles of the shipping port. Some American centres are 3,000 miles distant. Being comparatively close to England, the apples are carried at an ordinary rate of freight, as against the enhanced charges incurred on fruit conveyed in specially constructed cool chambers. The freight from port to port is usually 3s 6d a barrel, and the cost of a barrel and packing amounts to 1s 8d; so that, despite all advantages, the fruit has to be a fair share of expense before the grower gets any return for his produce.

Only apples technically described as "clean" are shipped in the first two grades; that is to say, the fruit must be free from blemish or spots. Unfortunately these disfigurements sometimes develop on the voyages especially in the case of an early variety, the Gravenstein. This year the crop is estimated to provide about 1,000,000 barrels, the equivalent of 3,000,000 English bushels of apples, of which a large proportion will be Ribston Pippins, Blenheims, Spitzenbergs, Baldwins, and Greenings. Of fine handsome Kings there are not many. Prices range from moderate to low, for, although the crop in Nova Scotia is much smaller than that of last year, there are on the market enormous quantities of apples from other parts of the world, thus lowering the value all round.

It may safely be said that the community of Nova Scotian apple growers is a prosperous one. Every season, of course, is not entirely successful. Nor is uninterrupted success to be expected in regard to crops in any part of the world; but by taking the average results of fat and lean years, there isn't much reason to complain at the generosity of Nature in the Annapolis Valley, "the land of Evangeline."—London, Eng., Telegraph.

The Cutworm.

Cutworms cause more widespread injuries and are responsible for more injuries on the part of farmers, market gardeners and others who cultivate the soil, than most classes of injurious insects. Taking them as a class, with such well-known pests as the San Jose Scale, the Codling Moth and the Hessian Fly—all of which are among our most destructive insect enemies. There are certainly few insects which, year after year, do such widespread damage to garden and field crops as the various caterpillars known commonly as cutworms. The annual loss occasioned by these insects in Canada amounts to hundreds of thousands of dollars. In one year (1900), the Variegated Cutworm alone destroyed in British Columbia crops to the value of $168,-000, and, if we add the losses in the same season in Manitoba and Ontario, the figures could easily reach $200.000. Ctirrenden has estimated that the total damage caused by this cutworm in the above year in the United States and Canada amounted to the enormous sum of $2,500,000.

Injury by cutworms is mostly effected in spring, when plants are young and succulent, but there are a few species which occur in destructive numbers as late as the middle of summer. As a rule, however, cutworm injury ceases before the end of June. As their popular name indicates, these caterpillars have the habit of cutting off the plants, during the night, near the surface of the ground or a little below it. When they are present in numbers in a garden or field, the plants will soon be seen to have been cut or eaten off and when an examination is made, the cutworm will most likely be discovered in the soil, coiled up and just below the surface. In many instances the young plant will be found to have been drawn partly into the ground. Not all cutworms, however, feed in this manner; some climb up into the fruit trees or such plants as currants, gooseberries, tomatoes, etc., and feed upon the fol age or the fruit.

In fact, when they are excessively abundant, they will attack anything green and juicy. In such years some kinds assume the marching habit, so characteristic of the army-worm. In seasons of severe infestations it is often necessary, unless the proper precautions are taken, to resow, or replant a second or even a third, time before a crop can be secured.

A cutworm vary considerably in the time of their appearance in the different stages—egg, larvae, pupa and adult—and as such appearance, too, is often irregular from year to year, it is not possible to state their life-history in general. Some pass the winter in the pupal state, or as half-grown caterpillars, and others in the egg or adult state. The months of the chief injurious species appear in June, July and August.

The eggs of cutworm moths, as a rule, are laid in clusters or masses on the leaves of trees, shrubs, weeds and grasses, etc. They have even been found on window panes and on the putty, as well as on clothes which had been hung out to dry. In the case of the Variable Cutworm, "Mamestra Atlantica" Grt., we have found the eggs on the upper surface of the honeysuckle leaf, in a compact heap of three layers. Another species (in confinement) laid eggs singly or in clusters of from 3 to 20. The number of eggs laid by a female varies considerably. In some clusters there will be less than one hundred eggs, in others, over 700; in fact, a female of one species is koown to have laid over 1,000 eggs. The eggs of most of these moths are laid in early or mid-summer. Those of some species, however, may be deposited as early as the end of April.

When a cutworm becomes full-grown, it enters the earth and makes an earthen cell in which it changes to a browinsh or dull reddish pupa, and when this happens in June or July the moth usually emerges in about two weeks' time. Some cutworms, however, do not change to pupae immediately they complete their earthen cell, but remain as larvae for some days, the actual period often varying, and the moths in such

cases do not emerge for three or four, or even more, weeks from the time the caterpillar became full-grown and entered the earth.

There are many different kinds of beneficial insects which prey upon cutworms and help very materially to keep these pests in check. Some of these are parasitic insects, laying their eggs upon the bodies of the cutworms. These eggs hatch and the young maggots or grubs feed internally upon the living cateroillar until they nave ultimately destroyed it. Others are predaceous and are constantly hunting after cutworms to devour. One of the most important of these latter is the Fiery Ground Beetle, "Calosoma calidum" Fab., the brub of which is known as the Cutworm Lion. This beetle, both in the adult and the grub state, destroys large numbers of cutworms. It is brownish-black in colour with three rows of coppery-red pits on each wing cover. In length it is about seven-eights of an inch. Another important enemy is the black Ground Wasp, "Ammophila luctuosa" Smith. This wasp digs the cutworms out and stores them in its nest as food for its young grubs.

In addition to the parasitic and predaceous insects which destroy cutworms, some of the native birds are very fond of these fat, juicy caterpillars. The value of many of our wild birds as insect destroyers, should be more and more recognized, and farmers, gardeners, etc. should do all they possibly can to prevent them from being shot and their nests from being robbed. The Meadow Lark, Blue Jay, Catbird, House Wren, etc., destroy every year large numbers of cutworms Even the much abused crow is extremely valuable, as insects constitute its principal food during spring and early summer, and of the insects eaten cutworms form a most importtant part.

Parasitic fungous diseases, such as species of "Empusa," help to reduce outbreaks of cutworms. These caterpillars are also subject to bacterial diseases.—Arthur Gibson, Chief Assistant Entomologist, Division of Entomology, Department of Agriculture, Ottawa.

Work of the N. B. Fruit Division.

During the past summer the horticultural division of the provincial Department of Agriculture continued the work started in 1911, of conducting orchard surveys in different parts of the province. These surveys consist of a farm to farm census of fruit culture and conditions in certain sections, and are being conducted with the object of gathering information of value to the fruit growing industry and of carrying information on varieties, cultivation, insect and fungous pests and their control, etc., directly to the individual fruit growers. All the farms fronting on the western bank of the St. John River from Fredericton to Woodstock, a distance of 62 miles, were surveyed in this manner and records of each property are now on file in the office at Fredericton. A systematic survey of the chief fruit sections of Charlotte County, of the section around Hart Lake, Queens County, and of considerable territory in the Parishes of Shediac, Moncton and Dorchester, Westmorland County was conducted. In this orchard survey work over 800 properties were examined and recorded. Assistance in planting orchards and in examining bearing orchards and orchard sites was given on about 80 farms which were visited at the special request of their owners. The twenty-one illustration orchards, which were fully equipped last winter with spraying machinery and materials, were inspected twice and found to be making good progress. The three demonstration orchards started by the Department of Agriculture in 1911 were operated again this year together with the orchard of C. R. McKenzie, of Lingley, Kings County. These orchards are responding well to the treatment and the financial returns are very encouraging.

Mr. R. P. Gorham, Assistant Horticulturist, accompanied the Better Farming Special through New Brunswick from June 8 th to the 26th as lecturer in horticulture. In addition to his regular work in fruit growing, Mr. Gorham spent a week in October in tracing the whereabouts of the European potatoes imported into St. John last spring, and known to have been more or less affected with potato canker. Some of these potatoes were sold locally and used for seed purposes, hence the possibility of a spread of the disease. This matter has since been taken up by the Dominion authorities.

With a view to opening up a market in the British Isles for New Brunswick fruit, a number of trial shipments of Duchess apples, in both boxes and barrels, were made to London, Liverpool, Manchester, Birmingham and Glasgow. The gross prices received for such early perishable fruit were very satisfactory, the boxes fetching as high as $1.85 and the barrels as high as $3.90. The returns realized indicate that if adequate steamship transportation direct from St. John to ports in the United Kingdom is provided, a considerable amount of early apples may be sold there annually at a good profit to our growers. Officials of the fruit division are now assisting some of the growers in the Long Reach district to prepare 200 boxes of Wealthy, Bishop Pippin, Bethel and Canada Baldwin, and this consignment will be shipped to Glasbow very shortly from St. John. This will give us much needed information as to the probable selling values of these varieties of New Brunswick apples.

Thirty boxes of apples were recently sent to the New Brunswick Emmigration Office at London, for advertising and display purposes, and, Mr. A. Bowder, the agent there, has reported that they arrived in splendid condition and were superior to those then available for display purposes at the Dominion Office. There are now in cold storage at St. John nearly 360 boxes which officials of the fruit division selected and packed for exhibition purposes during October. One hundred of these are to be purchased by the Dominion Government to represent the apple growing possibilities of New Brunswick at the exhibition to be held next summer at Ghent, Belgium. Another one hundred boxes will be sent to Mr. Bowder and by him distributed over the United Kingdom to the various emmigration officers. The balance of these apples will be used for advertising purposes in Canada.

An illustrated leaflet on "Forest-tent Caterpillar," a reprint of Bulletin No. 2. and a 32 page illustrated pamphlet on the "Orchard Opportunities in New Brunswick," were prepared, printed, and distributed during the year, and copies of the same may be had on application. All details of the work referred to above will be published in the report on Horticulture which should be off the press in February.

The Department now considers the time ripe for the holding of short courses in fruit growing of two, three or four days duration, in various parts of the province and are planning to hold a number of these during the coming winter. The interest in fruit growing is rapidly increasing and the indications point conclusively to the setting of many new orchards and to better care of the old orchards. This is well evidenced in the increasing orders for trees received by the Fruit Growers' Association, and in the fact that the number of spraying outfits and amount of spraying material used during 1912 show an increase of 1,080 per cent. over those in use in 1910. The province of New Brunswick is beginning to be known and sought after for its fruit lands as the presence here during the past summer and fall of a number of prominent English capitalists, fruit growers from British Columbia, and representatives of leading apple buyers of the Old Country, indicates, and we look forward with confidence to the rapid creation and enlargement of our fruit industry.

Profitable crops every year

HOW?

Farmers nowadays are able to get rid of much uncertainty in growing their crops. Good yields can be secured in spite of weather conditions that once were regarded as hopeless;—one essential aid to a dependable crop is a dependable fertilizer. In a good season it means a big success; in a bad season it prevents failure. Therefore, use

Bowker's Fertilizers

Bowker's Fertilizers are soluble, active, sure. They are backed by forty years of experience, the best materials, the best facilities and prompt service. Suitable for every crop and adapted to every pocketbook.

We want Agents in unoccupied territory. Write today for prices and terms; this may mean a good business for you if you act at once.

Write anyway for our illustrated catalogue and calendar before you buy your spring fertilizer. We want you to know what we can do.

BOWKER FERTILIZER COMPANY

76 Lyman Street, Buffalo, N. Y. 42 Chatham Street, Boston, Mass.

Original and largest manufacturers of special fertilizers.

Eddy's Matches

MADE ON HONOUR,
SOLD ON MERIT,

AT ATTRACTIVE PRICES
AND FULL COUNT.

ALWAYS EVERYWHERE IN

DAIRYING.

Yarmouth Creamery Promises Success.

MANY signs are evident that dairying is on the increase in Nova Scotia, but perhaps none more noticeable at present than the success that is already being attained by The Yarmouth Creamery,Ltd., of Dayton, Yarmouth Co. The company was organized late in the fall of 1911, in time, however, to get the outside of their building up before winter—thus being able to carry on the building operations during the winter—and were ready for the early spring business opening about the 1st of April of this year.

It is com posed of good business men who foresaw the advantages of such an institution in the community. A site was selected two miles from Yarmouth town, in the centre of a good farming community, and where proper drainage and water supply were already available. A beautiful fresh water pond in the rear only a few rods distant which gives a supply of water and ice and adds materially to the appearance of the place.

The building was erected with an eye to business and as can be seen by the illustration. It is not a large or an elaborate affair but possesses every requisite that is needed in a successful creamery. The main building is

Yarmouth Creamery, Dayton, Yarmouth Co. N. S.

about thirty by sixty-five feet. The foundation is of concrete—with a wall of concrete, two feet higher than the floor of the make room, which is also concrete—making the building very sanitary. The building proper is built of wood, shingled on the outside and sheathed on the inside, with an ell to one side for boiler and engine rooms. The office is situated in the corner nearest the street and next back of that the make room. Then back of that the make room, then storeroom and a refrigerator built on the plans furnished by the Dept. of Agriculture at Ottawa, and where the temperature can be readily controlled at about 40 degrees F. during the summer months. The ice house is in the extreme end of the building and all under one roof.

The power is supplied by a 12 H. P. boiler and 10 H. P. steam engine. The machinery is all new and up-to-date.

The output for the first year promises to greatly surpass the expectations of the management and they will be able to continue operations all through the winter months. The farmers are giving it great support for they already realize that it will be a permanent market for their cream at a better average price than what they have been accustomed to and a great saving in labor. One man who used to make over 100 lbs. of butter per week and supplied about 25 customers commenced using the creamery about the first week of its existence.

There are a lot of good dairymen in Yarmouth and a lot more interested that will become good dairymen, and with continued good management on behalf of the management and a hearty co-operation with perhaps some friendly rivalry among the patrons we may look forward to it being one of our strongest co-operative dairy centres in a short time.—W. A. McK.

The Five Champion Cows

Jacoba Irene has held first place among the Jerseys, for yearly production of milk and fat, for almost four years. Her third yearly record of 17,253.2 pounds of milk, containing 954.1 pounds of fat, completed January 24th, 1909, at the age of ten months, surpassed all previous records by 104.48 pounds of fat. Her production of three successive years of 42,900 pounds of milk containing 2,366.1 pounds of fat makes her one of the greatest long distance cows of the world.

She was bred by J. M. Shrader of Missouri but owned by A. O. Auten of Illinois while making her wonderful record, and can now be seen with three of her sisters and her mother in the Premier Jersey herd owned by F. B. Keeney of New York. A family of equal strength of constitution and producing ability is seldom seen. Pogis Irene 2nd, the dam of the world's champion, in her sixteenth year produced during the first 213 days of her period of lactation 5,800 pounds of milk containing 341.14 pounds of fat. The animals in the pedigree of Jacoba Irene for several generations are American bred, Ida of St. Lambert being her great great grandam.

Her great length and depth of body, magnificent udder, and the general indications of strength, should be borne in mind when contemplating her phenomenal production.

Jacoba Irene, as well as the other members of Mr. Auten's herd, was given an opportunity to do her best work, as is evidenced not only by her record but also by the fact that for the year 1907 the average for all the cows of this herd in milk was 389.9 pounds of butterfat.

Should the record of Jacoba Irene be surpassed she will never be forgotten, especially by those who have had the opportunity of seeing and studying her. She is worthy of all the praise and admiration she may receive.

Banostine Belle De Kol, the champion for yearly fat production of the Holstein breed, and likewise of all other breeds, is not the product of chance, but, on the contrary, stands in the honored position she now holds because of the careful applications of the principles of breeding and because of intelligent care and feeding. She comes from a line of producing ancestors. On the paternal side she traces back through Friend Hengerveld DeKol Butter Boy, and DeKol's 2nd's Butter Boy 3rd to DeKol 2nd. On the maternal side three generations removed is Euphrasia A. With the blood of such cows as these in her veins it is not to be wondered at that she is a phenomenal producer.

Banostine Belle DeKol was bred and developed on the Maplecrest Farm owned and operated by Dan Dimmick & Bro. of Ohio. She made her 365-day world's record of 1058.34 pounds of butterfat with her third calf, being five years two months and twenty-two days old when this calf was dropped. She gave milk up to the time of freshening and was not fattened in preparation for the test. Her milk yield was 27,404.4 pounds for the year with an average of 3.85 per cent. fat.

She is a cow with pronounced dairy temperament, large capacity and strong constitution. Her ration was well selected at all times, and was made up from a great variety of feeds. Mr. Dimmick is a very close student of his cows and endeavors to supply them with feeds such as they relish, and such as are suited to the requirements of milk production.

The test barn of the Maplecrest farm is excellently planned and constructed. In large, well ventilated, well lighted box stalls, with pleasant sanitary surroundings and the best of care, Banostine Belle DeKol and her two half sisters, Daisy Grace DeKol and High-lawn Hartog DeKol, have worked side by side with the result that the sum of their records, 74,715.2 lbs. milk containing 3,194.8 ,bs. fat, excels the combined records of any other three cows in the world.

Spotswood Daisy Pearl surpassed all other Guernseys in production of fat for a period of 365 days, when she completed her record on Jan. 7, 1912. At the age of 7 years and 5 months she was put on test and produced, between Jan. 6, 1911, and Jan. 7, 1912, 18,602.8 lbs. milk containing 957.38 lbs. fat, the average per cent. of fat being 5.15. Although she has not been dry but 53 days since she freshened with her first calf, her extraordinary ability as a producer was not recognized until she came to her third home, the Anna Dean Farm of Ohio, owned by O. C. Barber. Here, under the direct care of Carl Gokerell, she was given an opportunity to do the best work she was capable of doing. Her persistency is largely responsible for her large record, as she never exceeded 57.6 lbs. of milk in one day, and 365 days after freshening she was producing 48 lbs. Her test was continued for 632 days with a total production for that time, 30,097.40 lbs. milk containing 1,536.97 lbs. fat.

As would be expected she has a very large barrel, is quite angular in conformation and has a wide-awake disposition. She displays a great deal of quality as indicated by her hide, hair and horns, but in many ways does not conform to the present day show ring type.

In connection with a conformation permitting a large consumption of feed, Spotswood Daisy Pearl inherited her dairy tendencies from lines of producing blood. Her pedigree contains a great many A. R. animals, and the number is rapidly growing. May Rose 2nd is removed only three generations on her dam's side, and both her sire and grandsire on the paternal side have a number of A. R. daughters.

The feeding of a cow doing work such as that done by Spotswood Daisy Pearl is an important and difficult task. It can only be done by one who through vigilance, training and natural love for animals is able to translate into requirements the slighest variations in the tenor of the cow's actions from day to day.

Spotswood Daisy Pearl received just such attention and her ration consisted of a great variety of feeds which were changed slightly from time to time, the object being to supply the nutrients required in feeds most palatable to her and that contained the least possible indigestible material.

To both the cow and the caretaker is honor due for the making of such a record.

---

that holds the highest record of the breed for yearly production, stands with 31 other Swiss cows that have been admitted to the Record of Production, as a confirmation of the faith in the breed, displayed some six years ago when the Brown Swiss Association forsook the dual-purpose standard for one classifying the Brown Swiss as a dairy breed. With the record of production only a little more than a year old, it stands to reason that the breeders are not as familiar with the most efficient methods of securing maximum production as they will be. Notwithstanding this fact, however, the average productian of the first 32 cows, of all ages, to qualify for registration in the Register of Production is 10,860.7 pounds of milk containing 429 pounds fat. Kalista W. stands at the head of this list with a record of 16,609.2 pounds of milk containing 650.32 pounds butterfat. This record was completed January 29th, 1912, when she was 7 years, 4 months and 17 days old.

Kalista W. was bred by Fernando Wheeler of Connecticut but was owned at the time she made her record by Tracy Dows of New York. She is by Lamont and out of Kalista who in turn is by Lamont thus making Kalista W. closely inbred. Her superior producing ability may be attributed to the intensifying of the blood of Lamont as may also her size be charged to inbreeding, she being somewhat small for the breed, weighing perhaps 1100 pounds.

With so commendable a record made during the first year of official testing, greater things may be expected for the Brown Swiss in the future.

Lily of Willowmoor, owned by J. W. Clise, of Washington, will have completed within a few days a new Ayrshire record for yearly production of both milk and butterfat. Up to date of going to press she has completed 331 days of her test with a record of 20,951 lbs. milk containing 842.06 lbs. fat. Mr. Clise makes a conservative estimate that her record for the year will be near 22,227 lbs. milk, containing 902 lbs. fat. She was born October 15th, 1906, being bred and developed by her present owner on Willowmoor Farms.

She calved at the age of 2 yrs., 294 days and an official test that year produced 9,211 lbs. milk, containing 348.92 lbs. butterfat. Calving again after a seven weeks' rest at the age of 3 yrs., 363 days, she produced that containing 479.56 lbs. butterfat, losing the benefit of a few days by being shipped to the National Dairy Show at Chicago. She milked over year in official test 12,730 lbs. milk, the year, not going dry until in December, and her actual season's production was 13,629 lbs. milk, and 521.82 lbs. butterfat. After a five weeks' rest she calved again at the age of 5 yrs., 92 days. Her three calves are all heifers, named Willowmoor Lily 2nd, 3rd, 4th. Her last calf was sired by Willowmoor Robin Hood, son of the former world's champion, Netherhall Brownie 9th, thus the two nearest dams af this calf. are two of the world's champions. Lily of Willowmoor is an individual of sufficient excellence of conformation to warrant the risk of shipping her several thousand miles with the Willowmoor Farms' show herd when she was almost dry and within three months of calving. Her

first two years' work was done without any special attention, running with a large herd and under adverse rather than favorable conditions for large production.

Her sire, Drummondine, is an advanced registry sire but with only a few daughters, as he was always used in a small herd until placed at the head of Willowmoor herd, where there are only a few daughters left. His full brother Nox'emall, on the other hand, has more advanced registry daughters than any other sire; some of which have held world's records for their ages. The dam of Lily of Willowmoor is a first class cow with a herd production last season of 11,458 lbs. milk, containing 414.90 lbs. butterfat. Two other daughters of this cow, one in two-year-old and the other in yearling form, bid fair to become large producers.

Lily of Willowmoor has developed wonderfully this season under the care given her. She is a large cow, weighing in her present condition. practically 1400 lbs. In view of her age development this season, and staying qualities, it is believed, barring accidents, that she will increase her record in future.—Hoard's Dairyman.

Comparative Feeding Value of Cotton-seed Meal.

On practically every farm where the feeding of live stock is carried on it is necessary that some form of concentrates be purchased to balance the home grown feeds that may be available. There is no difficulty in growing enough carbohydrate food on the average farm. The most expensive element of food to purchase and the one most generally needed is that of protein origin. It is therefore important to consider which foodstuff can be bought at the least cost and will most nearly fulfill the needs of the situation.

The true feeding value of cotton seed meal is not fully appreciated in some sections of the country where it should be largely utilized. This is not surprising, because it is in many respects a comparatively new foodstuff as compared with such old and standard concentrates as bran, middlings, gluten meal, etc. Then, it has not been pushed as vigorously as the foregoing and farmers who are not familiar with it are afraid to use it extensively. Briefly, it is the by-product in the manufacture of cotton-seed oil. The hull of the cotton seed is removed, the kernel cooked and subjected to pressure to remove the oil. The residue or cotton cakes are then pulverized, in which form they are placed on the market.

At present cotton seed meal is selling locally, in ton lots at $35.00. Doubtless, some are of the opinion that they cannot afford to pay this, and instead, are purchasing bran at $28.00 or other foodstuffs at current prices. That this is an erroneous idea is borne out by the following table, giving the digestible protein, carbohydrates and fat contained in 100 pounds of cottonseed meal, wheat bran, gluten meal, linseed meal and brewers' grain:

	Pounds of Digestible Protein	Carbohydrates	Fat
Cotton seed meal	37.2	16.9	12.2
Wheat bran	12.2	39.2	2.7
Gluten meal	25.8	43.3	11.0
Linseed meal	28.2	40.1	2.8
Brewers' grains	15.7	36.3	5.1

These constitute the principal concentrates bought and used on the farm, and those having the highest content of digestible protein.

From this statement it appears that 100 pounds of cotton seed meal contains three times as much digestible protein as 100 pounds of wheat bran, or in other words, when the farmer feeds three pounds of cotton seed meal he is giving the protein equivalent of nine pounds of wheat bran. Observe that cotton seed meal furnishes more than twice as much digestible protein as brewers' grains, one-fourth more than linseed meal and one-third more than gluten meal. Also note that it is considerably richer in fat than any of the others. These figures establish its high feeding value and clearly demonstrate that for the money paid out it holds the premier position for the largest amount of digestible protein to be had in any concentrate.

As a milk producer cotton seed meal is unexcelled. Owing to its concentrated nature, however, it must be fed with care or unsatisfactory results will be likely to follow. It is better to begin with, say one pound a day and increase gradually. As a rule it is not advisable to feed more than three pounds a day to a dairy cow, although in the case of large milkers as much as five pounds may some times be given. Of course, it is understood that this meal must not be fed alone; it is too strong. Feed it mixed with the home-grown foodstuffs, such as corn meal, oat chop, etc., reducing the amount of such feed each day as the amount of cotton seed meal is increased. Better results will generally follow where the meal is fed with silage or some other succulent cooling food. In fact where silage is used cotton seed meal can be fed without any grain feed, and a balanced ration formed, by sprinkling the meal over it.

FEEDING FOR BEEF.

In feeding beef cattle it should also be given consideration. It is a common practice of many farmers to persist in using an exclusive fattening ration, such as corn provides, believing that it will make cheaper beef and a larger number of pounds per head per day than one consisting of part corn and a concentrate rich in protein. Experiments show, however, that a combination ration of the character indicated will prove more satisfactory in every way, giving as it does a greater variety to the food and producing an animal that kills out better owing to the better blending of the fat and lean throughout the carcass.

For growing yearlings and other young stock it is unequalled if fed moderately. It should not be fed to calves under six months of age or be included in a ration for young pigs. A small quantity may be fed to ewes after parturition with advantage. Not more than a handful a day should be added to a ration of corn, oats and bran, and this amount will not be sufficient to injure young lambs. Some animals do not eat it readily at first, but after they become accustomed to it grow very fond of it.

Like practically every other foodstuffs on the market to-day, cotton seed meal is frequently adulterated. If one is familiar with the genuine article the difference can be easily detected. The pure meal is a light golden color and should be free from black and brown specks. Hulls are generally used to adulterate the meal. When pure it contains from 41 to 48 per cent. of total protein and the farmer can protect himself by demading a guarantee of this analysis from dealers.—By J. Hugh McKenney, Corinth, Ont.

A "Stocky" Meeting.

The Agricultural Society at its special meeting on Monday last spent a very busy four hours till midnight. It finished the Exhibition prize list, fixed on October 28th and 29th for Exhibition days, appointed Mr. H. H. Archibald, its President, and Mr. John Tapp, one of its directors, to proceed without delay to St. John's to urge on the Government more stringent measures for the extirpation of Potato Canker, which is gaining some headway in this and other localities, and also to secure its assistance towards getting a supply of hay to have on hand to mitigate the hay famine and prevent as much as possible the destruction of live stock; it likewise reduced the stallion fees, and ordered his "keep" for the next 12 months to be put up to tender; and distributed the fine looking young rams that arrived here the other day from Port-au-Basques, obtained by the Board for stock purposes.—Harbor Grace Standard.

The dairyman who will sell off each season two or three of his poorest cows will soon improve his herd if he replaces them by heifers raised from his best cows.

SEED OATS!

If the farmers of the Maritime Provinces, Quebec and Ontario want to make sure of getting the highest possible grade of seed oats for the Spring of 1913 apply to us at once. To prevent a repetition of the disaster that befell so many farmers last year by sowing devitalized grain, we have stored at Point Du Chene and Pictou 50,000 bushels of **large, selected, separated White Seed Oats, true to name and free from noxious weed seeds.** It will be the farmers own fault if they do not procure good seed as the extra yield of these oats pays twice over cost of the seed.

Our firm name is stencilled on every bag. Do not allow the dealers to give you other than Read's oats for seed.

JOSEPH READ & CO., LTD., Summerside, P. E. I.

WISH-TON-WISH STOCK FARM

Breeders of High Class Holstein-Friesian Cattle and Berkshire Pigs

A few good young cows that have freshened and bull and heifer Calves for sale, sired by Schuiling Sir Posch, twice grand champion Holstein bull at the Canadian National Exhibition at Toronto: also some sired by Sir Mercena LaForit Lad, who won first prize wherever shown. Can spare a good Berk sow or two ready to breed. We are also booking orders for young pigs for spring delivery.

HARDING BROS., Proprietors, WELSFORD, New Brunswick.

LIVE STOCK.

Wintering Brood Sows.

The time was, not so long ago, when the hog-raisers of these provinces were quite satisfied to raise one litter each year from their brood sows. The market offered no particular inducements to raise more, and the object was more to supply pork for the family table than to attempt raising hogs on a commercial scale. The past few years have brought about a change. Hogs this year have been hovering between $8 and $10.50 per hundred on the market, and the supply has been far short of the demand. The breeders of purebred hogs have certainly had their innings, too. The problem is to find hogs for the customers, rather than customers for the hogs.

This condition of the industry makes the hog a particularly valuable commodity to the farmer. He can no longer afford to content himself with one litter a year from each sow; nor can he afford to lose many of the young pigs from the various troubles which are common in this country.

It may be quite truly said that the point upon which success or failure in the hog business hinges is the care of the brood sows, particularly during the winter months. With our short summer season it is a difficult matter to get two litters of pigs and have them arrive when the weather is comparatively warm and still have them brought to maturity mainly on green feed. The cost of production is reduced considerably by utilizing such crops as rape, peas and oats, alfalfa or clover as pasture, and lessening the need for grain. The breeder of pure bred pigs is desirous of securing early spring litters for show purposes and also to have large, strong boars to meet the fall trade. Other things being equal, size denotes early maturity, and such is always at a premium whether in show ring or sale yard. The breeder of commercial hogs is also after the March or April litters so that he can have his second litter ready for the market with the shortest period of grain feeding the following winter.

The matter of properly caring for the brood sow throughout the year is therefore, of paramount importance. During the summer, when she can run at large and have all the grass and exercise that she cares for, there is little to trouble about as she can take care of herself. During the winter she has none of these natural conditions to supply her with the proper nourishment and support a litter of young pigs, and, consequently, the feeder has to supply these conditions as nearly as possible. That is the whole problem. Now, what is more unnatural than to shut a sow in a pen where she can take very little excise, and to feed her on concentrated grain feeds that she never tastes during the summer. F. W. Stevens, Live Stock Commissioner for Alberta has done considerable research work on the lack of exercise and heavy feeding of grain during the winter are largely responsible for the number of weak pigs, pigs bare of hair, and many other deformities quite common in this country. Many farmers will contradict this statement, but it is best proven from the experience of practical hog raisers. Our most successful breeders have best results where the sows are given free range during the cold weather and allowed to rustle considerably for their living.

SHELTER.

A straw pile is almost an indispensable shelter for brood sows. Many strong healthy litters of pigs have been born where the only shelter was a straw pile, but the secret is not that alone. The grain ration was a suitable one and fed only in limited quantities. The feeding trough was placed at some distance from the straw pile, which made the sow exercise in going to and from her shelter. There are also other ways of providing cheap shelter. A Saskatchewan breeder puts a few poles about six feet high to form a roof and blows straw over this from the machine, which forms a house-like structure. Another successful stockman from Edmonton winters sows in an old log shed, completely open at the south end, and allows them free range outside.

THE HOG COT.

The A-shaped hog cot appears to be the last word in sucessful hog raising. Many of our best breeders are using them. One Alberta farmer prefers them without a floor, and uses no bedding, claiming that the sows root down in the dry soil and are perfectly comfortable. He strongly advises against the use of straw in these cots, claiming that the heating and rotting of the straw is very detrimental to the health of the sows.

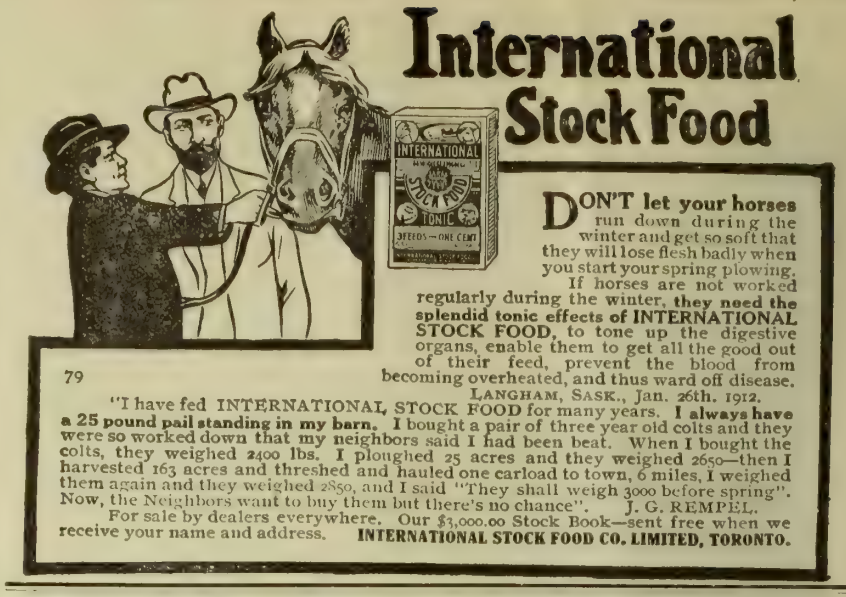
Oscar Miller, of Cheadle, Alta., has submitted to us an arrangement of hog cots, whereby he claims that sows may be comfortably wintered and early spring litters raised very successfully. We might say that this same plan is used at Manitoba Agricultural College and appears to be satisfactory. The scheme is to place several of these cots side by side and about three feet apart at the base. These are filled between and covered over with straw or manure. By placing the back end of the pens against the fence and nailing a few boards from one pen to the other in front the sows would not be able to get between the pens. Mr. Miller's strongest arguments in favor of this style of pen is that the heat is utilized to the best advantage, and the pen is cheap. Heat always goes upward in a room and in such a pen the space at the roof is minimized and the heat is thrown downward. He claims that a sow's own heat will reduce the temperature 25 to 30 degrees, and by putting manure over the sheds built in this manner, the temperature can be reduced practically 50 degrees. The full truth of this is realized when the difference in inside space between a square building and one of these A-shaped cots is considered.

Some breeders have a fully equipped piggery leading to a yard where the sows are turned out for exercise. Here the exercise is only voluntary, and if the weather is cold the sow is likely to take shelter and stand in the warmest corner of the yard.

OTHER ESSENTIALS.

While we firmly believe that plenty of exercise and only limited amounts of grain are the main essentials to success in hog raising; yet there are a few other essentials which must be given attention. A brood sow should have abundance of mineral matter and limited amounts of carbohydrates or heat-producing food. Sows will eat a surprisingly large amount of ashes. Shale also is good if it can be produced. Of the common crops that help form a complete food for sows, we may name mangels or sugar beets. Wheat and barley in large quantities are very injurious on account of their heating properties. Oats and some bran is the ideal cereal food, cooling in their nature and well-balanced in their composition.

In conclusion, we would say give exercise some way or other; feed as little grain as will keep the sows in reasonably good condition. Get in a pile of sods this fall to throw into the pen during the winter. Throw in at least some of the ashes from the furnace. Keep the pen free from draughts. Carefully guard against constipation, feeding roots as a corrective. Feed mineral matter in abundance. Keep the pens dry and clean, and success should follow.—The Nor'-West Farmer.



Age of Cattle.

For the purpose of settling any disputes at any time that may arise out of protests made against exhibitors who show animals out of their class, from the standpoint of ages, the International Live Stock Exposition management has adopted the following specifications as a basis for determining the ages of cattle:

Twelve Months—Any animal of this age shall have all of its milk (calf) incisor teeth in place.

Fifteen months—At this age, center pair of incisor teeth may be replaced by center pair of permanent incisors (pinchers,) the latter teeth being through the gums not yet in wear.

Eighteen months—The middle pair of permanent incisors at this age should be fully up in wear, but next pair (first intermediate) not yet cut through gums.

Twenty-four months—At this age the mouth will show two middle permanent (broad) incisors fully up in wear, and next pair (first intermediate) well up, but not in wear.

Thirty months—The mouth at this age may show six permanent incisors, the middle and front intermediate pairs fully up and in wear and the next pair (second intermediate) well up, but not in wear.

Thirty-six months—Three pairs of broad teeth should be fully up and in wear, and the corner milk teeth may be shed or shedding, with the corner permanent teeth just appearing through gums.

Thirty-nine months—Three pairs of broad teeth will be fully up and in wear, and corner teeth (incisors) through gums, but not in wear.

These specifications are based upon a large number of observations made upon animals of various ages, and may be used by those who purchase young animals to use permanently in their herds as a means of determining their ages should they be in doubt as to their being such as they are represented to be by the sellers. Of course, animals that are well fed and forced to early maturity from forced feeding frequently have their teeth appear considerably before the usual time that they make their appearance, but the above specification may be relied upon as a good guide, as they reasonably allow for such cases. A matter of a few months does not make much difference, except in very young animals.— Colman's Rural World.

Prize Winning Southdowns

Exhibited at St. John, Halifax and Charlottetown exhibitions by Ciphas Nunn, Winslow Road, P. E. I.

The Champion Steer at the Internarional

The honor of the big show came to Canada. Glencarnock Victor, the two-year-old grade Aberdeen Angus steer owned by J. D. McGregor, Manitoba, Canada, was the outstanding sweepstakes, winner of the 1912 International. The competitors were an illustrious line of bovine excellence, but Judge McKeen made no mistake in picking out the McGregor steer for the thirteenth of a brilliant line of Sweepstakes winners. The Manitoba steer was a bullock of such superb quality and general excellence that the decision met with unanimous ringside approval. Sired by a purebred Angus bull, Elm Park Ringmaster, and out of a grade cow without name, he was dropped in Brandon on April 20th, 1910, and was a precious calf with all the best traits of his predominating strain. He was fitted for the International by Robert Mr. McGregor's herdsman. When shown he weighed in the neighborhood of 1,630 lbs., perfectly distributed and in ideal shape. His victory is a triumph for Canada feeding methods. Glencarnock has never tasted corn, he being a product of grass and small grains—oats and barley. "He is a winner all over is the last that can be said of him. Carrying no surplus fat he will kill out superbly. McGregor is to be congratulated on his double honor in fitting a grand champion and fitting him in a province where it was asserted the conditions were adverse to the feeding of the Aberdeen-Angus cattle.

He was later sold for 50c. per lb. and bought in the neighborhood of $815. This is a much lower price than the 90c. letched last year, but there was nothing about Victor that influenced this fall off.

J. W. Calbeck's
Prize winning Yorkshire Boar.

A Deadly Dip.

Mr. W. F. Southey, a well-known sheepbreeder in Cape Colony, has suffered great loss among his 6 and 8 tooth sheep through dipping twice within fourteen days in caustic soda and sulphur. The sheep after the dippings were observed to waste away, and on examination it was found that the lungs were rotten and full of a yellow jelly-like matter. Many of the auimals have died, and it is expected that the loss will be quite 50 er cent. of the whole. It is a singular fact that the mixing of the dip was carried out by a sheep inspector with a high reputation, and there was a veterinary surgeon present at the time.

The veterinary surgeon condemned the dip in toto, and advised them to abandon it, but the inspector overruled him, declaring that it was a recognized Government dip, and had been well proved. This dip is strongly advocated by many farmers, and is fairly popular, and it is difficult to to have occurred to anybody that Southey's animals. It does not seem some poisonous substance may have account for the effect it had on Mr. inadvertently found its way into the ingredients used for mixing the dip.—The Pastoralists Review.

Canada's Honor at the International

To the Dominion of Canada came many of the honors of the International show in the following championships: Champion Fat Wether, by J & D. J. Campbell, Woodville. Champion breeding ewe, Shropshire, J. & D. J. Campbell. Peter Arkell, Teeswater, annexed the champion ram and ewe in Oxford Downs, and also owned the champion flock. Many other firsts came to Canada. The greatest honor of the show, the winning of the grand championship of the exposition also belongs to the Dominion, being annexed by James D. McGregor & Sons, Brandon, Manitoba, on Glencarnock Victor, a two-year-old grade Angus steer, Graham Bros., Claremont, owned by the grand champion Clydesdale stallion in Lord Gleniffer, the impressive, showy son of Sir Ronald. Many other honors of a lesser character are also Canada's.

Feeds Cidre Apples to Cows.

I note in a recent issue that F. G. C. asks for other peoples exoerience in feeding cider apples to cows. This has been mine: Meeting, one day, a neighbor who was drawing home a load of apple pumice from a cider mill, I asked him what he intended going with it. He replied that he was feeding it to his cows, and that it was as good for them as corn silage.

Having no pigs on my farm that fall, I began feeding windfall apples to my cows, using about four quarts daily per cow. I was then sending cream to a nearby creamery, and I found that while I fed the apples to the cows, not only was there an increase in milk, but also in cream,

J. W. Calbeck's
Prize winning Yorkshire Sow.

which increase fell off when the apples were all fed out.

Again, this year, having no pigs, I have fed windfall apples to my cows in the same proportion as before, and have noticed a decided increase in milk. I cannot judge as to the cream, as I am now selling milk. Again, I noticed a decrease in milk when the apples were all fed out. I don't think it would be a good policy to feed enough apples to make the cows drunk, because that is a bad habit in any animal.—P. R., Franklin County, Mass. in N. E. Homestead.

For Sale

A few young Hereford bulls, heifers and cows. Six choice White Wyandotte cockerels $2.00 each.

R. R. BLACK,

NEXT SHORT COURSES

AT THE

Agricultural College, Truro, Nova Scotia

JANUARY 7th to 17th, 1913

Special courses for MEN and for LADIES open FREE to all students from the Maritime Provinces. In the past, these courses have been attended by people of all ages from sixteen to over seventy.

In the men's Short Course instruction will be given in Judging, Feeding, and Management of Live Stock of all kinds, Soil Cultivation, Crops, Seeds, Horticulture, Dairying, Veterinary Practice, Poultry and, if requested, classes will be provided in Entomology, Botany, Chemistry, etc.

A special feature of these courses will be Instruction in Road Making. The best practical experts available have been secured for this course.

The LADIES COURSE will include Dairying, (especially Butter and Soft Cheese making) Poultry Gardening, Floriculture, and Domestic Science.

All railways in the Maritime Provinces will give single fare on Standard Certificate Plan.

Write for full particulars to

M. CUMMING, Principal, -- Truro, Nova Scotia

THE HORSE.

The Clydesdale at Home.

SCOTLAND is probably the only country that could have developed the Clydesdale breed of horses. A Clydesdale is a remarkable adaptation to environment in that land of heather, hill and hardness. A horse of any other draft breed would clash with the type and temper of the country and its people. Scotland reveals some of its most typical characteristics in its equine stocks. Its plants, animals and people give the appearance of interlocking relationships. They are independent.

Scotland has a climate that forces land-animals to grow hair and the hills to clothe themselves in heather and bracken. Shagginess characterizes its fauna and flora. One thinks of Carlyle's long, bushy eyebrows, of the Shetland's abundant mane and tail, of the Galloway's thick hair, of the black-faced ram's dense, heavy coat, of the Collie's handsome mantle of warmth, of the Clydesdale's flowing feather, of the mossy-coated Short-horns, of the heather-grown hills, of the thatched cottage and the kilted West Highlander with his ample beard. Nature sets no example of nudity in Caledonia. And hair is an index of strength. There was Samson, for example. He may have had Scotch in his pedigree.

However impressive the Clydesdale on this side may be in type and condition, he does not show so well against an American background as the same stamp of horse in a Scottish prize-ring, public road or turnip-field. To see several hundred Clydesdales at home, led, ridden or driven by men and lads whose fathers before them bred Clydesdales, is to get a fair idea of the solid qualities that distinguish the breed. It is more than probable that if the Scottish farmer could secure a better horse than the Clydesdale for his uses he would adopt him. He holds fast to his immemorial favorite because it meets his requirements. The breed has come to be a part of his life as a farmer. It has won the farmer's confidence and the nation's pride.

Clydesdales furnish the agricultural motive power of Scotland. They pull the machinery that grows and transports the crops. They draw the vehicles in which lads and lassies speed merrily along roads, hedged and walled. They play a prominent part in the commerce and social life of a people famed for brains and brawn. A visitor learns, if he talks with many Scots, what combination of characteristics it is that constitutes fundamental values in their heavy horses. He may begin his agricultural tour in Scotia with the notion that weight and substance outrank action and endurance in the list of draft virtues; he may harbor the opinion that the Scot makes altogether too much ado about the legs and feet of the Clydesdale. He may know things about the breed that a clase study of its native representatives will compel him radically to revise, and he will be compelled to listen with respect to the claims of suoeriority advanced by the informed adherents of the breed.

Uniformity in type and cleanness and quality of underpinning are the outstanding impressions that a student receives lrom exhibits and farm studs of Clydesdale in Scotland. He observes that the native farmer looks down most of the time when judging a Clydesdale, and yet those keen, blue eyes are trained to see a horse all over. The Scottish judge specializes in attention to the legs and feet; he knows that in building anything the ground work must be right if the superstructure is to serve the purpose in view. On this theory the Clydesdale has been bred for centuries from the ground up, and having been made enduring from the stifle and forearm down, the ends and middle pieces are undergoing improvement. Type in a clydesdale at home is not the result of feeding to fatnes; it is the issue of masterful breeding, guided by the increasing light of patient years. Fat will make any first-rate lot of pure-bred draft horses appear even in type; and it is the healthy form of a work horse that tells the most truthful story about type.

Selective breeding is a fine art among Scottish Clydesdale breeders. They have clearly-defined ideas toward which they have worked for many generations. Sons succeed their fathers, continually an unbroken and undeviating course. Many studs have been established for a century. Breeders are responsive to the demands of the export trade, but they refuse radically to modify their predominent native type. There are several types commonly bred, the object being to meet the requirements of the several countries which draw considerable numbers of Clydesdales from Scotland; but the horse that is best adapted to the service of local agriculture and industry is never lost sight of as an ideal among the generality of farmers, large and small. New Zealand is importing Clydesdales on an increasingly liberal scale, expressing a consistent fancy for the low-set, thick, weighty kind, for which good prices invariably are realized; and Australia buys the same sort. South Africa and Russia also are purchasing superior specimens. Canada remains the chief customer, however, importing about 1,000 last year, and the United States furnishes an outlet which is an important factor in the trade. In 1910 the total exports, apart from a small number of unregistered animals, were more than 1,400 head; in 1911 they exceeded 1,500.

Fashion is at war with utility and commercial popularity, as one may learn at the leading shows and sales; but the majority of breeders are not misled nor swayed by the caprice of that seductive dame. In recent years a so-called showyard type has gained sectional vogue, and partially nullified the work of the standard-setting exhibitions. Breeders are quick to detect even the slightest radicalism of judges. A type that the markets demand is steadfastly sought; showring preferences do not go, if they go against trade currents. Some men, like horses, will occasionally kick over the traces, aiming blindly at a fanciful object. Scottish breeders are strongly united in their common purpose, and harmony marks their progressive work; but among them there are makers of fashion who not only fail to influence the great mass of horsemen but by antagonism intensify the overwhelmingly larger opposition.

What agreeably surprises the American in attendance upon an exhibition of Clydesdales in Scotland is the extent to which the classes are filled by small breeders. To be sure the extensive estates contribute a large percentage of the entries, but the representation of humbler citizens is the most striking feature of the leading exhibits. At the Highland and Agricultural Society's show at Dumfries in 1910 most of the Clydesdales were owned by small breeders, many of whom were represented by individual entries. Several foals were led into the ring by unexcited lads, with downy faces. Big, deep-bodied mares, with sound feet and legs, were shown by farmers who obviously knew nothing about professional exhibiting as an art. Horses shown by such men usually receive a full measure of attention by the judges; it is the horses instead of the owner that is considered.

Nearly $400,000 is distributed among Scottish Clydesdale breeders every year by foreign buyers of their stock. A demand of that character maintains an active, discriminating interest in improvement and production. Breeding is encouraged in other ways, chiefly by shows with attractive prizes. A system of stallion-hiring is in operation which places within the financial reach of small breeders the services of the most celebrated stallions. Local societies are formed in different districts for the express purpose of hiring champions and noted breeding horses. In this way seed of the best quality is well distributed, and the owners of high-priced stallions are liberally rewarded. For most of the leading prizewinners a profitable hiring demand is promptly expressed. A valuable by-product of the hiring system is the road exercise which stallions are required to take in traveling their districts.

British cities and corporations keep in cart and dray service thousands of the best Clydesdales that they can buy. One of the largest users is the Caledonian Railway Co. Glasgow also demands a large number of high-class geldings, and whoever sees them in the streets, thereafter has a critical standard by which to judge drafters. But the geldings and mares that one sees in the fields and roads of Scotland make the deep impression which ever afterward is quickly revived upon occasion. We shall never lose from mind the impression made by a string of farm mares, fillies and young colts which farmers were leading in a road in Aberdeenshire on an afternoon in June two years ago. It was a rare opportunity to appreciate the Clydesdale at home.

Among the reigning popular sires

Horsemen Attention ! !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevents the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

CURES:
SPLINTS
CURBS
SPAVINS
ENLARGEMENTS
COUGHS
COLDS
DISTEMPER
GLANDERS
FOUNDERS

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

DEAR SIR :--I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.
W. A. C. RANDALL, M. D.

Hillsboro, N. S.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

POULTRY.

Prof. Staneburn Shows How to Compound Rations and Feed Poultry for Egg Production.

In the following article Prof. F. H. Stoneburn shows how to compound and feed different rations to poultry for egg production. He claims that liberal feeding is necessary if heavy yield is to be had from the layers. He says:

Feeding for egg production is far from being an exact science and it is impossible to lay down close and definite rules that will meet all conditions. However, there are some well established basic principles underlying the art, and a few feeding methods which are generally successful. If these are thoroughly understood and a fair amount of common sense used in adapting them to one's local conditions, the results will, as a rule, prove entirely satisfactory.

As previously stated, the well-balanced ration always contains one or more articles from each of the four great groups of poultry feed stuffs, which, for convenience, have been designated "grits. grains, greens and grubs." If the bill of fare lacks any one of these, the best results cannot be secured. In short, the birds must have a variety.

There is another point which is of equal importance. Liberal feeding must be the rule if heavy production is to be secured. It is plain that no regular output of a finished product can be had if there is a lack of raw material.

Many poultrymen fail to get a maximum egg yield because they fear to feed their birds heavily. Much has been said about the dangers of overfeeding, and it must be admitted that individual birds will occasionally break down under the strain, becoming over-fat and practically barren. This had led to the belief that heavy feeding makes the hens too fat to lay. As a matter of fact, they do not get too fat to lay; they get fat because they do not lay. Such birds should be sent to the block for which end they are eminently fitted.

Let it be understood that the above refers especially to the production of market eggs. The breeding stock should be handled differently, as in this case the desired object is eggs with strong fertilizing rather than a great output. The proper treatment to be accorded the breeding birds will be discussed in due time.

When deciding upon the exact ration to be adopted one may choose between purchasing ready-mixed commercial feeds or securing the various grains and mixing them at home. Each method possesses certain advantages, depending largely upon the section of the country and the relative local prices of the various feed stuffs.

There are on the market a number of proprietary mixtures of both whole grain and mash which are mighty satisfactory. Some of these are guaranteed under the pure-food acts and bear tags showing their composition and analysis. In a few cases they are sold with a clear guarantee that they will prove entirely satisfactory, failing in which the purchase price will be refunded. This is certainly a safe basis on which to proceed, as the poultryman runs slight chances of experiencing heavy loss.

The big advantage of ready-mixed rations lies in the fact that their use eliminates the bother of making up the feed at home, and also enables one to purchase in small amounts, as required. In limited quantities, at least, the cost of commercial mixtures is usually less, as the price of the several grains which go to make up the ration is decidedly high when purchased separately in lots of a few pounds each. As a result, the home mixture is rather costly when prepared in small quantities. The large operator who can buy in car lots and the farmer, possessing home-grown grains do not face this particular problem.

It has been clearly demonstrated that it is best to feed the layers both scratch feed and mash, the former being a mixture of whole and cracked grains, and the latter of ground grain and their by-products. Neither alone gives the results which may be secured from the combination of both. As a general rule, the heaviest production is secured where these mixtures are used in the proportion of two pounds of the scratch feed to one pound of the mash. It is not always possible to regulate this exactly, but as the birds eat the scratch feed more readily, the desired result may be secured by carrying the quantity of the scratch feed according to the necessities of the case. When this is reduced the amount of mash eaten will be correspondingly increased.

It is customary to keep grit, shell and similar materials in hoppers to which the birds have access at all times. These necessities do not rot or mould and are not eaten by rats, so this plan involves no loss from such sources. It also insures the fowls a plentiful supply and does away with the necessity of frequent feeding.

Green food should be given regularly and abundantly, each bird receiving as much as she will readily eat. However, none should be left over to freeze or spoil, as this frequently causes trouble.

The animals feed may be fed separately or mixed in the mash. There is a wide difference of opinion as to the relative merits of the two methods, but both are successfully used. When fed alone, this material is either placed in hoppers to which the birds may repair at any time, or definite amounts supplied daily in troughs. Milk is usually fed in open pans, but is excellent to use in the mash where the latter is fed moist.

As previously stated, there are no known grain mixtures which will produce the greatest possible number of eggs at all times and under all conditions. A few of those which have proved generally satisfactory are discussed below. When purchasing the various grains especial attention should be paid to their quality, and damaged or mouldy grain refused. Oats are particularly valuable, but, unfortunately, they vary greatly in quality. Plump, heavy oats, those carrying a large proportion of meat, should be used in all cases. Light oats are largely husk, and this fiber is difficult to digest. Commercial ground oats are frequently of inferior quality, and unless one is sure of the value of the particular brand offered, it pays to purchase heavy oats and have them ground to order.

A staple scratch feed mixture is made up as follows:

60 lbs. wheat.
60 lbs. corn.
40 lbs. oats.

These three grains should always be fed, and when the price is right variety may be secured by adding from ten to twenty pounds each of barley, buckwheat and corn, any or all of them.

An agricultural experiment station, prominent in the poultry work, recommends the following mixture for Leghorns.

Scratch feed for winter use:
60 lbs. wheat.
68 lbs. corn.
30 lbs. oats.
30 lbs. buckwheat.

For summer feeding the buckwheat is omitted.

Mash mixture, fed dry:
60 lbs. cornmeal.
60 lbs. wheat middlings.
30 lbs. wheat bran.
10 lbs. alfalfa meal.
10 lbs. oil meal.
50 lbs. beef scrap.
1 lb. salt.

Another experiment station which has devoted itself to producing eggs from Plymouth Rocks uses this ration:

Scratch feed. By measure:
4 parts corn.
2 parts oats.
2 parts wheat.

Mash mixture, fed dry:
200 lbs. wheat bran.
100 lbs. wheat middlings.
100 lbs. cornmeal.
100 lbs. gluten meal.
100 lbs. beef scrap.

On alternate months fifty pounds of linseed meal is added to the above.

A well-known New England breeder of Wyandottes has used for years the following feeds.

Scratch feed, by measure, equal parts of corn, wheat and oats:

Mash mixture. By measure:
3 parts wheat bran.
3 parts cornmeal.
1 part wheat middlings.
1 part gluten meal.
1 part ground oats.
1 part fish scrap.

Fine results have been secured from a large flock of Rhode Island Reds fed the following ration:

Scratch feed. By measure:
3½ parts wheat.
3½ parts oats.
4 parts corn.

Mash mixture, fed dry:
200 pounds wheat bran.
100 pounds wheat middlings.
100 pounds gluten meal.
100 pounds corn meal.
100 pounds ground oats.
100 pounds animal meal.

A flock of several hundred White Plymouth Rocks, noted for the production of unusually large eggs, receives this ration.

Scratch feed, by measure—Winter:
3 parts corn.
1 part wheat.
4 parts oats.

Summer:
2 parts corn.
2 parts wheat.
4 parts oats.

Mash mixture. Fed dry.
100 pounds wheat bran.
50 pounds wheat middlings.
100 pounds cornmeal.
100 pounds ground oats.
5 pounds powdered charcoal.
5 pounds salt.
Beef scrap in hoppers before the fowls at all times.

A comparison of the above rations discloses the fact that they are very much alike as regards the various ingredients, but that there are slight variations in the respective amounts used. Any one of these may be adopted and slight changes made, as experience and the market price of the different materials seem to warrant.

As a general rule, the scratch feed is thrown in a litter of hay, straw, leaves hens to take considerable exercise when searching for it. The accepted or planer shavings, which causes the custom to feed this grain at the rate of one quart per day to each ten hens. In some cases this amount is slightly reduced, in order to increase the consumption of the mash.

Ordinarily, the day's allowance of scratch feed is given at once, two or three hours before dark. In some cases it is the practice to give a light feeding of the grain in the morning and the balance of it in the afternoon The latter method does not seem to possess any material advantage, and the busy man will naturally prefer to adopt the single feeding as a matter of convenience. In case the attendant cannot look after the birds during the hours of daylight, an automatic feeder may be installed. When regulated according to the size of the flock, these appliances work splendidly.

The LAWRENCE-WILLIAMS COMPANY, Toronto, Can

The addition of 5 per cent. of coarse beef scrap to the scratch feed is a very good plan, especially where beef scrap is used exclusively as the source of animal food. The scrap should be screened, the coarser portion being used in the grain mixture and the fine in the mash.

We would like to again emphasize the desirability of so feeding the grain mixture as to compel the birds to take plenty of exercise. The use of an ample supply of litter is the easy way of solving this problem. On some farms where the birds are given free range it is customary to scatter the grain broadcast over an extended area in order to keep the flock busy searching for it.

There exists a wide difference of opinion among poultrymen as to the relative merits of dry mash and wet mash feeding. The limits of the present article prevent a discussion of the matter, but it is of such importance that it will be fully considered later in the series.

In practice, the dry mash is more generally used. The dry mixture is placed in feeders and the birds permitted to eat of it at will. When fed wet, the mixture is mixed with milk or water until it is thoroughly dampened. It is then fed once daily in troughs, usually late in the afternoon.

Table scraps may be given at will, and they form a most desirable addition to the ration. Provision should be made to save them all, together with such of the kitchen waste that is suitable for feeding. In this way the grain bills for a small flock may be greatly reduced.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

Long after it was dark I sat there, wondering whether anybody else would come. When this appeared improbable for that night, I undressed, and went to bed; and there, I began to wonder fearfully what would be done to me. Whether it was a criminal act that I had committed? Whether I should be taken in custody, and sent to prison? Whether I was at all in danger of being hanged?

I never shall forget the waking, next morning; the being cheerful and fresh for the first moment, and then being weighed down by the stale and dismal oppression of remembrance. Miss Murdstone reappeared before I was out of bed; told me, in so many words, that I was free to walk in the garden for half an hour and no longer; and retired, leaving the door open, that I might avail myself of that permission.

I did so, and did so every morning of my imprisonment, which lasted five days. If I could have seen my mother alone, I should have gone down on my knees to her and besought her forgiveness; but I saw no one, Miss Murdstone excepted, during the whole time—except at evening prayers in the parlor; to which I was escorted by Miss Murdstone after everybody else was placed; where I was stationed, a young outlaw, all alone by myself near the door; and whence I was solemnly conducted by my jailer before anyone arose from the devotional posture. I only observed that my mother was as far off from me as she could be, and kept her face another way, so that I never saw it; and that Mr. Murdstone's hand was bound up in a large linen wrapper.

The length of those five days I can convey no idea of to any one. They occupy the space of years in my remembrance. The way in which I listened to all the incidents of the house that made themselves audible to me; the ringing of bells, the opening and shutting of doors, the murmuring of voices, the footsteps on the stairs; to any laughing, whistling, or singing, outside, which seemed more dismal than anything else to me in my solitude and disgrace—the uncertain pace of the hours, especially at night, when I would wake thinking it was morning, and find that the family were not yet gone to bed, and that all the length of night had yet to come—the depressed dreams and nightmares I had—the return of day, noon, afternoon, evening, when the boys played in the churchyard, and I watched them from a distance within the room, being ashamed to show myself at the window lest they should know I was a prisioner—the strange sensation of never hearing myself speak—the fleeting intervals of something like cheerfulness, which came with eating and drinking, and weny away with it—the setting in of rain one evening, with a fresh smell, and its coming down faster and faster between me and the church, until it and gathering night seemed to quench me into gloom, and fear, and remorse—all this appears to have gone round and round for years instead of days, it is so vividly and strongly stamped on my remembrance.

On the last night of my restraint, I was awakened by hearing my name spoken in a whisper. I started up in bed, and putting out my arms in the dark, said:

"Is that you, Peggotty?f'

There was no immediate answer, but presently I heard my name again in a tone so very mysterious and awful, that I think I should have gone into a fit, if it had not occurred to me that it must have come throughthe keyhole.

I groped my way to the door, and putting my own lips to the keyhole, whispered:

"Is that you, Peggotty, dear?"

"Yes, my own precious Davy," she replied "Be as soft as a mouse, or the Cat'll hear us."

I understood this to mean Miss Murdstone, and was sensible of the urgency of the case; her room being close by.

"How's mamma, dear Peggotty? is she very angry with me?"

I could hear Peggotty crying softly on her side of the keyhole, as I was doing on mine, before she answered. "No. Not very."

"What is going to be done with me, Peggotty dear? Do you know)"

"School. Near London," was Peggotty's answer. I was obliged to get her to repeat it, for she spoke it the first time quite down in her throat, in consequence of my having forgotten to take my mouth away from the keyhole and put my ear there and though her words tickled me a good deal, I didn't hear them.

"When, Peggotty?-'

"To-morrow."

"Is that the reason why Miss Murdstone took the clothes out of my drawers which she had done, though I had forgotten to mention it.

"Yes," said Peggotty- "Box.-'

"Shan't I see mamma?"

"Yes," said Peggotty. "Morning."

When Peggotty fitted her mouth to the keyhole, and delivered these words through it with as much feeling and earnestness as a keyhole has ever been the medium of communicating, I will venture to assert' shooting in each broken little sentence in a convulsive little burst of its own.

"Davy, dear. If I ain't been azackly as intimate with you. Lately, as I used to be. It ain't because I don't love you. Just as well and more, my pretty poppet. It's because I thought it better for you. And for someone else besides. Davy, my darling, are you listening? Can you hear?"

"Ye—ye—ye—yes, Peggotty!" I sobbed.

"My own!" said Peggotty, with infinite compassiob. "What I want to say, is. That you must never forget me. And I'll take as much care of your mamma, Davy. As ever I took of you. And I won-t leave her. The day may come when she'll be glad to lay her poor head on her stupid, cross, old Peggotty's arm again. And I'll write to you, my dear. Though I ain't no scholar. And I'll—I'll—" Peggotty fell to kissing the keyhole, as she couldn't kiss me.

"Thank you, dear Peggotty!-' said I. "Oh, thank you! Thank you! Will you promise me one thing, Peggotty? Will you write and tell Mr. Peggotty and little Em'ly, and Mrs. Gummidge and Ham, that I am not so bad as they might suppose, and that I sent 'em all my love—especially to little Em'ly? Will you, if you please, Peggotty?"

The kind soul promised, and we both of us kissed the keyhole with the greatest affection—I patted it with my hand, I recollect, as if it had been her honest face—and parted. From that night there grew up in my breast a feeling for Peggotty which I cannot very well define. She did not replace my mother; no one could do that; but she came into a vacancy in my heart, which closed upon her, and I felt towards her something I have never felt for any other human being. It was a sort of comical affection too; and yet if she had died, I cannot think what I should have done, or how I should have acted out the tragedy it, would have been to me.

In the morning Miss Murdstone appeared as usual, and told me I was going to school; which was not altogether such news to me as she supposed. She also informed me that when I was dressed, I was to come down-stairs into the parlor, and have my breakfast. There I found my mother, very pale and with red eyes: into whose arms I ran, and begged her pardon from my suffering soul

"Oh, Davy!" she said. "That you could have hurt any one I love! Try to be better, pray to be better! I forgive you;)| but I am so grieved, Davy, that you should have such bad passions in your heart."

They had persuaded her that I was a wicked fellow, and she was more sorry for that, than for my going away. I felt it sorely. I tried to eat my parting breakfast, but my tears dropped upon my bread-and-butter, and trickled into my tea. I saw, my mother look at me sometimes, and then glance at the watchful Miss Murdstone, and then look down, or look away.

"Mastet Copperfield's box there!" said Miss Murdstone, when the wheels were heard at the gate.

I looked for Peggotty, but it was not she; neither she nor Mr. Murdstone appeared. My former acquaintance, the carrier, was at the door; the box was taken out of his cart, and lifted in.

"Clara!" said Miss Murdstone, in her warning note-

"Ready, my dear Jane," returned my mother. "Good bye, Davy. You are going for your own good. Good bye, my child. You will come home in the holidays, and be a better boy."

"Clara!" Miss Murdstone repeated.

"Certainly, my dear Jane," replied my mother, who was holding me. "I forgive you, my dear boy. God bless you!"

"Clara!" Miss Murdstone repeated.

Miss Murdstone was good enough to take me out to the cart, and to say on the way that she hoped I would re-pent, before I came to a bad end; and then I got into the cart, and the lazy horse walked off with it.

CHAPTER V.

Am Sent Away From Home.

We might have gone about half a mile, and my pocket-handkerchief was quite wet through, when the carrier stopped short.

Looking out to ascertain for what, I saw, to my amazement, Peggotty burst from a hedge and climb into the cart. She took me in both her arms, and squeezed me to her stays until the pressure on my nose was extremely painful, though I never thought of that until afterwards when I found it very tender. Not a single word did Peggotty speak. Releasing one of her arms, she put it down in her pocket to the elbow, and brought out some paper bags of cakes which she crammed into my pockets, and a purse which she put into my hand, but not one word did she say. After another and a final squeeze with both arms, she got down from the cart and ran away; and my belief is, and always has been, without a solitary button on her gown. I picked up one, of several that were rolling about, and treasured it as a keepsake for a long time.

The carrier looked at me, as if to inquire if she were coming back. I shook my head, and said I thought not. "Then, come up," said the carrier to the lazy horse; who came up accordingly.

Having by this time cried as much as I possibly could, I began to think it was of no use crying any more, especially as neither Roderick Random nor that Captain of the Royal British Navy had ever cried, that I could remember, in trying situations. The carrier seeing me in this resolution, proposed that my pocket handkerchief should be spread upon the horses back to dry. I thanked him, and assented; and particularly small it looked under those circumstances.

I had now leisure to examine the purse. It was a stiff leather purse, with a snap, and had three bright shillings in it, which Peggotty had evidently polished up with whitening, for my greater delight. But its most precious contents were two half-crowns folded together in a bit of paper, on which was written, in my mother's hand, "For Davy. With my love." I was so overcome by this, that I asked the carrier to be so good as to reach me my pocket-handkerchief again; but he said he thought I had better do without, and I thought I really had, so I wiped my eyes on my sleeve and stopped myself.

For good, too; though, in consequence of my previous emotions, I was still occasionally seized with a stormy sob. After we had jogged on for some little time, I asked the carrier if he was going all the way?

"All the way where?" inquired the carrier.

"There," I said.

"Where's there?" inquired the carrier.

"Near London," I said.

"Whay that horse," said the carrier, jerking the rein to point him out, ';would be deader than pork before he got over half the ground."

"Are you only going to Yarmouth, then?" I asked.

"That's about it," said the carrier. "And there I shall take you to the stage-coach, and the stage-coach that'll take you—wherever it is."

As this was a great deal for the carrier (whose name was Mr. Barkis) to say—he being, as I observed in a former chapter, of a phlegmatic temperament, and not at all conversational—I offered him a cake as a mark of attention, which he ate at one gulp, exactly like an elephant, and which made no more impression on his big face than it would have done on an elephant's.

"Did she make 'em, now?" said Mr. Barkis, always leaning forward, in his slouching way, on the footboard of the cart with an arm on each knee.

"Peggotty, do you mean, sir?"

"Ah!" said Mr. Barkis. "Her."

"Yes. She makes all our pastry and does all our cooking."

"Do she though?" said Mr. Barkis.

He made up his mouth as if to whistle, but he didn't whistle. He sat looking at the horse's ears, as if he saw something new there; and sat so for a considerable time. By-and-by. he said:

"No sweethearts, I b'lieve?"

"Sweetmeats, did you say, Mr. Barkis?" For I thought he wanted something else to eat, and had pointedly alluded to that description of refreshment.

"Hearts," said Mr. Barkis. "Sweethearts; no person walks with her?"

"With Peggotty?"

"Ah!" he said. "Her."

"Oh, no. She never had a sweetheart."

"Didn't she, though?" said Mr. Barkis.

Again he made up his mouth to whistle, and again he didn't whistle,

but sat looking at the horse's ears.

"So she makes," said Mr. Barkis, after a long interval of reflection, "all the apple parsties, and doos all the cooking, do she?"

I replied that such was the fact.

"Well. I'll tell you what," said Mr. Barkis. "P'raps you might be writin' to her, p'raps you'd recollect to say that Barkis was willin'; would you?"

"That Barkis was willing," I repeated, innocently. "Is that all the message?"

"Ye—es," he said, considering. "Ye—es. Barkis is willin'."

"But you will be at Blunderstane, again to-morrow, Mr. Barkis," I said, faltering a little at the idea of my being far away from it then, "and could give your own message so much better."

As he repudiated this suggestion, however, with a jerk of his head, and once more confirmed his previous request by saying, with profound gravity, "Barkis is willin'. That's the message," I readily undertook its transmission. While I was waiting for the coach in the hotel at Yarmouth that very afternoon, I procured a sheet of paper and an inkstand and wrote a note to Peggotty, which ran thus: "My dear Peggotty. I have come here safe. Barkis is willing. My love to mamma. P.S. He says he particularly wants you to know—Barkis is willing."

When I had taken this commission on myself prospectively, Mr. Barkis relapsed into perfect silence; and I, feeling quite worn out by all that had happened lately, lay down on a sack in the cart, and fell asleep. I slept soundly until we got to Yarmouth: which was so entirely new and strgnge to me in the inn-yard to which we drove, that I at once abandoned a latent hope I had had of meeting with some of Mr, Peggotty's family there, perhaps even with little Em'ly herself.

The coach was in the yard, shining very much all over, but without any horses to it yet; and it looked in that state as if nothing was more unlikely than its ever going to London. I was thinking this, and wondering what would ultimately become of my box, which Mr. Barkis had put down on the yard-pavement by the pole (he having driven up the yard to turn his cart), and also what would ultimately become of me, when a lady looked out of a bow-window where some fowls and joints of meat were hanging up, and said:

"Is that the little gentleman from Blunderstone?"

"Yes, ma'am," I said.

"What name?" inquired the lady.

"Copperfield, ma'am," I said.

"That won't do," returned the lady. "Nobody's dinner is paid for here, in that name."

"Is it Murdstone, ma'am?" I said

"If you're Master Murdstone," said the lady, "Why do you go and give another name, first?"

I explained to the lady how it was, who then rang the bell, and called out "William! show the coffee-room!" upon which a waiter came running out of the kitchen on the opposite side of the yard to show it, and seemed a god deal surprised when he was only to show it to me.

It was a large, long room with some maps in it. I doubt if I could have felt much stranger if the maps had been real foreign countries, and I cast away in the middle of them. I felt it was taking a liberty to sit down,with my cap in my hand, on the corner of the chair nearest the door; and when the waiter laid a cloth on purpose for me, and put a set of casters on it, I think I must have turned red all over with modesty.

He brought me some chops, and vegetables, and took the cover off in such a bouncing manner that I was afraid I must have given him some offence. But he greatly relieved my mind by putting a chair for me at the table, and saying very affably, "Now, six-foot! come on!"

I thanked him, and took my seat at the board; but found it extremely difficult to handle my knife and fork with anything like dexterity, or to avoid splashing myself with the gravy while he was standing opposite, staring so hard, and making me blush in the most dreadful manner every time I caught his eye. After watching me into the second chop, he said:

"There's half a pint of ale for you. Will you have it now?"

I thanked him and said "Yes." Upon which he poured it out of a jug into a large tumbler, and held it up against the light, and made it look beautiful.

"My eye!" he said. "It seems a good deal, don't it?"

"It does seem a good deal," I answered with a smile. For it was quite delightful to me to find him so pleasant. He was a twinkling-eyed, pimple-faced man, with his hair standing upright all over his head; and as he stood with one arm a-kimbo, holding up the glass to the light with the other hand, he looked quite friendly.

"There was a gentleman here yesterday," he said—"a stout gentleman, by the name of Topsawyer—perhaps you know him?"

"No," I said, ;'I don't think—"

"In breeches and gaiters, broad-brimmed hat, grey coat, speckled choaker," said the waiter.

"No," I said bashfully, "I haven't the pleasure—"

"He came in here," said the waiter looking at the light through the tumbler, "ordered a glass of this ale—would order it—I told him not—drank it, and fell dead. It was too old for him. It oughtn't to have been drawn; that's the fact."

I was very much shocked to hear of this melancholy accident, and said I thought I had better have some water.

"Why you see," said the waiter, still looking at the light through the tumbler, with one of his eyes shut up, "our people don't like things being ordered and left. It offends 'em. But I'll drink it, if you like. I'm used to it, and use is everything. I don't think it'll hurt me, if I throw my head back, and take it off quick. Shall I ?"

I replied that he would much oblige me by drinking it, if he thought he could do it safely, but by no means otherwise. When he did throw his head back, and take it off quick, I had a horrible fear, I confess, of seeing him meet the fate of the lamented Mr. Topsawyer, and fall lifeless on the carpet. But it didn't hurt him. On the contrary, I thought he seemed the fresher for it.

For A Soft Healthy Skin

Use Baby's Own Soap. It's "Best for Baby — Best for You".

Absolutely pure vegetable oils made fragrant by flower extracts, which help the skin, make Baby's Own Soap the best for toilet and nursery use.

Its fragrant, creamy lather delights all.

SUSSEX WOOD CUTTERS

Made in Four Different Sizes

We are offering these machines to the public with the belief that they are the best wood cutting machines on the market for the money. The Frame is made of the best seasoned hardwood, and well bolted. The Arbor is of the best turned steel, and runs in bearings made of the finest quality babbit. The Balance Wheel is a solid web and weighs 180 lbs. The Table is of heavy Steel Plates and indestructable. Wood Cutters are shipped with 28 in. saws unless otherwise ordered.

Remember we manufacture the celebrated Little Giant Thresher, The Sussex Root Pulper, Farmer's Feed Boilers, Grain Grinders and Hay Presses.

The SUSSEX MANUFACTURING CO., Limited, SUSSEX, N. B.

"What have we got here?" he said, putting a fork into my dish. "Not chops?"

"Chops," I said.

"Lord bless my soul!" he exclaimed. "I didn't know they were chops. Why a chop's the very thing to take off the bad effects of that beer! Ain't it lucky?"

So he took a chop by the bone in one hand, and a potato in the other, and ate away with a very good appetite, to my extreme satisfaction. He afterwards took another chop, and another potato; and after that another chop and another potato. When he had done, he brought me a pudding, and having set it before me, seemed to ruminate, and so become absent in his mind for some moments

"How's the pie?" he said, rousing himself.

"It's a pudding," I made answer.

"Pudding!" he exclaimed. "Why bless me, so it is! What!" looking at it nearer . "You don't mean to say its a batter pudding?"

"Yes, it is indeed."

"Why, a batter-pudding," he said, taking up a tablespoon, "is my favorite pudding! Ain't that lucky? Come on, little 'un, and let's see who'll get most."

The waiter certainly got most. He entreated me more than once to come in and win, but what with his tablespoon to my tea-spoon, his dispatch to my dispatch, and his appetite to my appetite, I was left far behind at the first mouthful, and had no chance with him. I never saw anyone enjoy a pudding so much, I think; and he laughed, when it was all gone, as if his enjoyment of it lasted still.

panionable, it was then that I asked

Finding him so friendly and com-

for the pen and ink and paper, to write to Peggotty. He not only brought it immediately, but was good enough to look over me while I wrote the letter. When I had finished it, he asked me where I was going to school.

I said, "Near London," which was all I knew.

"Oh! my eye!" he said, looking very low-spirited, "I am sorry for that."

"Why?" I asked him.

"Oh, Lord!" he said, shaking his head, "that's the school where they broke the boy's ribs—two ribs—a little boy he was. I should say he was—let me see—how old are you, about?"

I told him between eight and nine.

"That's just his age," he said. "He was eight years and six months when they broke his first rib; eight years and eight months when they broke his second, and did for him.

I could not disguise from myself, or from the waiter, that this was an uncomfortable coincidence, and inquired how it was done. His answer was not cheering to my spirits, for it consisted of two dismal words, "With whopping."

The blowing of the coach-horn in the yard was a seasonable diversion, which made me get up and hesitatingly inquire, in the mingled pride and diffidence of having a purse (which I took out of my pocket) if there were anything to pay.

"There's a sheet of letter-paper," he returned. "Did you ever buy a sheet of letter-paper?"

I could not remember that I ever had.

"It's dear," he said, on account of the duty. Threepence. That's the way we're taxed in this country. There's nothing else except the waiter. Never mind the ink. I lose by that."

"What should you—what should I—how much ought I to—what would it be right to pay the waiter, if you please" I stammered, blushing.

a "If I hadn't a family, and that family hadn't the cowpock," said the waiter, "I wouldn't take a sixpence. If I didn't support an aged pairint, and a lovely sister,"—here the waiter was greatly agitated—"I wouldn't take a farthing. If I had a good place and was treated well here, I should beg acceptance of a trifle, instead of taking of it. But I live on broken wittles—and I sleeps on the coals—"here the waiter burst into tears.

I was very much concerned for his misfortunes, and felt that any recognition short of ninepence would be mere brutality and hardness of heart. Therefore I gave him one of my three bright shillings, which he received with much humility and veneration, and spun up with his thumb' directly upwards, to try the goodness of.

It was a little disconcerting to me, to find, when I was being helped up behind the coach, that I was supposed to have eaten all the dinner without any assistance, I discovered this, from overhearing the lady in the bow-window say to the guard, "Take care of that child, George, or he'll burst!" and from observing that the women-servants who were about the place came out to look at and giggle at me as a young phenomenon. My unfortunate friend the waiter who had quite recovered his spirits, did not appear to be disturbed by this, but joined in the general admiration without being at all confused. If I had any doubt of him, I suppose this half-awakened it; but I am inclined to believe that with the simple confidences of a child, and the natural reliance of a child upon superior years (qualities I am very sorry any children should prematurely change for worldly wisdom), I had no serious mistrust of him on the whole, even then.

(To be continued,)

Mother and the Schools.

An editorial in the Chicago Examiner, published recently, closes with these words:

"Try to make your children realize that school is their opportunity. Make them to feel that when the school doors open it means more to them than if the door of some great mine of Aladdin's wealth were opened to them. Interest yourself in the school life of your children, in their studies, in their success, and especially in their disappointment and school sorrows—those sorrows are very real to little children.

"If you can do so become acquaintwork the teacher does—the greatest teacher feel that you appreciate the ed with the teacher in whose hands your children are placed. Make the work in the world.

"Make your children realize what they owe to the teacher—obedience, respect and gratitude."

Oftentimes it is worth a good deal of difficulty that a mother thus keeps in touch with the schools, but once she realizes that it is for the good of her children and she will overcome great obstacles. There are few mothers who do not earnestly desire to do the best possible for their children and who do not welcome help from whatever source it may come.

Many progressive communities of to-day have Parent-Teacher Associations. These organizatians are carried on by the parents with some representation from the teachers and are for the purpose of co-operating with the teachers in every way possible. They work along many different lines of activity; they do much in a material way, procuring equipment for which the board cannot provide, they encourage and often help to support various whole-activities such as the social life in a high 138.72.

school, athletics, debating and dramatic societies, but perhaps the most important work accomplished is the better understanding of the children and consequently the wiser treatment their problems which naturally results from the parents and teachers working together. At the meetings of these associations the problems peculiar to each school are considered, but also the broader questions connected with the education and home training of children, and in this way there grows up in a community a truer appreciation of what is really best for the children.

In many communities where such organizations do not exist, the Women's Clubs have departments that aim to meet this need. It is, however, much more effective to have a Parent-Teacher Association in connection with each school. Two or more such associations can profitably combine for certain meetings where a prominent speaker has been secured. The expense can thus be shared and a larger audience assured.

Is there an association in the school where your children go? If not, what can be done. A few enthusiastic mothers can make a beginning. Is it worth while?

ONTARIO WOMAN'S FORTUNE

Freed From That Weak, Languid, Always Tired Feeling, by Lydia E. Pinkham's Compound.

Thessalon, Ont.—"I cannot speak too highly of your medicine. When my appetite is poor and I have that weak, languid, always tired feeling, I get a bottle of Lydia E. Pinkham's Vegetable Compound, and it builds me up, gives me strength, and restores me to perfect health again. It is truly a blessing to women, and I cannot speak highly enough of it. I take pleasure in recommending it to others."—Mrs. ANNIE CAMERON, Thessalon, Ont.

Women who are suffering from those distressing ills peculiar to their sex should not lose sight of these facts or doubt the ability of Lydia E. Pinkham's Vegetable Compound to restore their health.

There are probably hundreds of thousands, perhaps millions of women in the United States who have been benefited by this famous old remedy, which was produced from roots and herbs over 30 years ago by a woman to relieve woman's suffering. If you are sick and need such a medicine, why don't you try it?

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

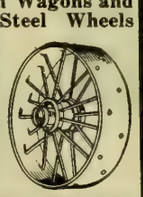
BUY A WAGON
YOU CAN DEPEND ON

For convenience, strength and durability, get a T-A Handy Farm Wagon. Designed especially for farm work, will give everlasting service under the roughest usage to which a wagon can be put. And besides—it is easy on horses.

T-A Handy Farm Wagons and Wide-Tire Steel Wheels

Carefully and strongly built of the highest grade material, these T-A Wide-Tire Steel Wheels will carry 25 to 50 per cent. heavier loads without the least danger of breaking down or getting stuck.

We will be pleased to send you descriptive catalogue. Write for it.



TUDHOPE-ANDERSON CO., Ltd. ORILLIA, Ontario.

A Des Moines man had an attack of muscular rheumatism in his shoulder. A friend advised him to go to Hot Springs. That meant an expense of $150.00 or more. He sought for a quicker and cheaper way to cure it and found it in Chamberlain's Liniment. Three days after the first application of this liniment he was well. For sale by all delaers.

Household Hints-

Plan meals several days ahead. There will be no waste then and bet ter combinations will be made.

Men doing heavy physical work need heavier and richer food than those whose work is sedentary.

Alcohol will quickly remove an obstinate porous plaster and also the leaves. ...

To dry a sweater coat nicely, tie a coat-hanger to the clothes-line and cover it with a clean cloth. Do not wring the sweater but hang it on this and let drip dry.

Do not let china become hot, as this harms it by making it brittle.

All measurements are level. Sift flour before measuring. Three teaspoons—1 tablespoon; 10 tablespoons—1 cup; 2 cups, 1 pint.

A band of surgeon's plaster around the thumb below the nail, will cure children of sucking their thumb.

As a protection against fire—a blaze from any source—you ought to keep a pail of sand handy about the house all the time.

Have the kitchen arranged so that utensils and food materials are close at hand. A cabinet, shelves, or hooks for small utensils—measuring cups, spoons, knives, forks and egg beaters; and cooking materials—salt, pepper, spices, baking powder, soda, sugar, etc., can be placed conveniently in any kitchen.

As a kitchen disinfectant salt has no equal. Pour the salt water from the ice cream freezer into pipes to disinfect them. Salt cleans iron, makes a good dentrifice, brightens the carpets, removes egg stains from silver spoons, will cause fruit stains to be more easily removed from linen; combined with acids will clean brass.

Do not lay silk waists away without taking out the shields, as the rubber is likely to crack the silk.

Beware of using celluloid combs in the hair. If they come near a gas jet, they will explode in the hair.

A bit of sandpaper tacked to the end of the ironing board will be found a great convenience for cleaning irons. Salt, too, will remove starch on irons.

It frequently happens that painters splash the glass windows when they are painting the sills. When this is the case melt some soda in very hot water and wash the glass with it, using a soft flannel. It will entirely remove the paint.

A simple cake icing is made by using orange juice or any other fruit juice and stirring in sufficient confectioners' sugar to have it the right consistency.

A man who has been camping is authority for the statement that an ordinary wax candle may be used to polish tan shoes. Rub the candle on the shoes and polish with a soft cloth.

When soot or ink falls on a carpet or rug never attempt to sweep it off at once, but cover it thickly with dry salt and let it stand for a day. Then you can brush off the salt and the stain will come with it.

As a rule, the folds of tablecloths are ironed very hard, and this, of course, will quickly wear out the cloth. There seems no sense in having the creases so very prominent, since the life of the cloth is lessened thereby. Few women need to be told that the position of the folds should be changed from time to time when ironing.

Clean up as you go along. Put things away immediately after use. Make use of as few mixing and cooking dishes as possible by rinsing or washing and using again. Put to soak in water dishes that can be cleansed easily. Do not make half an hour's dishwashing in preparing a meal. Work neatly—do not "clutter up" the kitchen.

Harvest Song.

Come to the meadow with me, dearie—
Come to the meadow and see, dearie—
The little green leaves have all turned red;
The autumn is here and the summer is dead;
The goldenrod's in the rose's stead—
And the harvest's for thee and for me, dearie.

Run to the orchard and stay, dearie—
The blossoms that bloomed in May, dearie—
The magic of fall
Has turned them all
Into fruit, to be gathered away, dearie.
The birds have flown to the eaves, dearie—
The trees have been robbed of their leaves, dearie—
The seed that was sown,
Has grown and grown,
And the grain has been piled into sheaves, dearie.

Come, gather it, all you can hold, dearie—
The harvest's grain is God's gold, dearie—
The squirrel has stored his nuts in the tree—
And someone is coming—oh, who can it be?
The little wind told 'em—I'll tell it to thee—
'Tis winter—he's bringing the cold, dearie.

—Montrose J. Moses in Good Housekeeping.

Poor Combinations.

Beef, macaroni and cheese, peas,—too high in protein.

Peasoup, meat, cheese, custard,—too high in protein.

Beef or mutton, baked beans, Indian pudding,—too high in protein.

Kingston, Ont.

Full line of veterinary remedies in stock including Dr. Bell's Wonder, fine blister for Spavins, Ringbones, lumps or bunches of any kind.

Lengthening the Vegetable Season.

Here is the experience of an enthusiastic gardener: Our eggplants lasted until cold weather, treated as follows: They were picked with great care, the stems dipped in melted paraffine, carefully placed in paper bags and hung on nails in the attic. Our carrots lasted till August because we stored them in clean sand in a cool place, seeing to it that they were in good condition when stored. Parsley lasted till the next spring's leaves were ready by lifting into a flower pot in the fall and keeping in a sunny window all winter. Cutting back aggrees with it. Tomatoes lasted till the first week in January. In some cases whole vines were pulled up and hung in a protected shed where they ripened for several weeks. Others were picked off and kept in a cellar that was neither hot nor cold.

Faith and Courage.

There are times when it is well that you take the initiative, and not wait for others to set the good example. The proper spirit with which wrong is that it must be put down, even if you must do it yourself. You are only one; but that seemingly insignificant minority, through your efforts and influence, may later increase to many, all as eager, persistent and energetic as yourself. You are then assured that, when the real conflict comes, each one will do his full share toward changing that minority to a triumphant majority. But remember that it requires true courage to be a minority of one, and true faith to work on, against odds, with full confidence in successful achievement.

A Few Butter Notes.

Butter made in a clean room, with clean utensils, well worked and packed in a good tub, will keep a good deal longer than that which is made by careless hands.

When you go into your milk room do you notice any bad smell? Don't do another thing until you have hunted up the source of that odor and removed it.

Cream kept too long has a sharp acid taste that works against the making of the best butter.

Old butter-makers notice it quickly if the streaks are not all worked out, and they know the butter was not made by a careful person.

A little strainer under the hole when you draw off the buttermilk will save itself many times over in the course of a single season.

Ventilation.

Why ventilate? Why bring fresh air into a house or barn? One cannot stop breathing for even five minutes—we are so dependent on the oxygen that the lungs can take out of the air. If no fresh air is allowed to enter a room occupied by several people the air soon becomes foul from the air coming from the lungs. Often when one enters a room it will feel close. In that case ventilation is necessasy. Breathing air over and over lowers one's vitality, which results in taking cols easily and along with the cold other troubles often start. Pure air is fully as important as pure food.—W. C. Palmer, N. Dak. Agr. Col.

Says Dr. Pankhurst: Perhaps you have a great mind, perhaps you have an eloquent tongue; it may be you have a large purse, and can glorify God and bless mankind with that; but perhaps you have nothing in the world but a kind, sweet smile. Then let that fall upon some poor life that has no smiles upon it. Remember that dewdrops glistening in the sun are just as beautiful as a rainbow.

MAPLE EVAPORATORS

TO THE LIVE FARMER OUR PERFECT MAPLE EVAPORATORS AND A SUGAR BUSH CAN BE MADE TO PRODUCE A REVENUE WHEN IT IS MOST NEEDED.

With our Maple Evaporator, sap is easily and economically converted into the finest quality maple syrup.

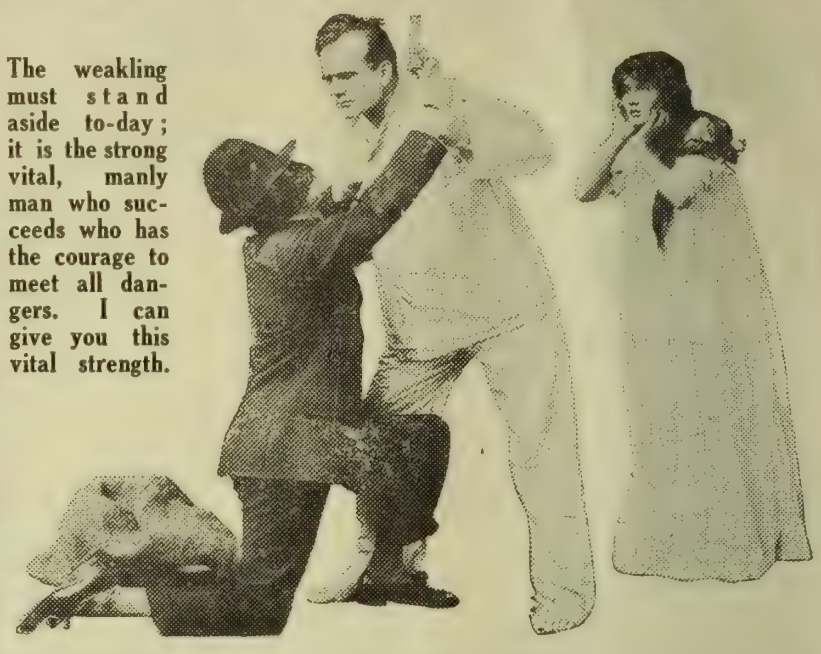
Restores Men To Vital Vigor

The weakling must stand aside to-day; it is the strong vital, manly man who succeeds who has the courage to meet all dangers. I can give you this vital strength.



Vitality is the thing which makes success; it gives men that compelling power which sends them forth eager and equipped to meet and overcome all obstacles; it is the thing which gives our young men courage to face death; it is the thing which inspires and holds a woman's love and faith. No matter what your age, I can give you this same vitality. I can restore the vigor you lost, no matter what early or later indiscretion may have sapped your streagth. I can make you "young" and keep you "young." From an intimate and studious observation of possibly 100,000 weakened men I say to you that vitality or the lack of it means all the difference between a manly man and a half man. The man who bubbles with vital power will exert a pleasing influence upon all with whom he comes in contact; women are naturally attracted to him, as are men. Lack of vitality is a negative condition, and it even repels. You wear my Health Belt and suspensory attachment all night; it sends a great, glowing, health-giving current of electro-vimut into your nerves, blood and organs; it takes all the "kink" out of your back and all the coward out of your makeup; it puts you right up in the "feeling fine" class and keeps you there. No stimulation, no false results; just a sure return to manhood and courage. Recommended also for rheumatism, pain in the back, kidney, liver, stomach and bladder disorders. It makes you feel young and keeps you feeling young forever.

Let Me Send You THIS BOOK Free

Here is my latest illustrated book, "Health In Nature, containing a fund of privrte information relating to weaknesses of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely uo obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

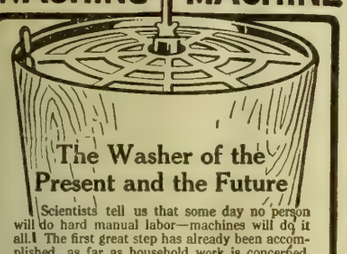
NEW CENTURY WASHING MACHINE



The Washer of the Present and the Future

Scientists tell us that some day no person will do hard manual labor—machines will do it all. The first great step has already been accomplished, as far as household work is concerned. The New Century Washer, not only takes all the hard manual labor away from washing, but it washes clothes better than such work has ever been done before. The water tap furnishes the power, the New Century does nearly all the rest.

Washing-machines are not new but the New Century is. The other kinds did *Some* of the work, the New Century does almost *all* the work. The others gave trouble, the New Century saves trouble. The difference is in the patented and exclusive features of the New Century. Ask your dealer about them or send to us for full information.

FLORICULTURE.

Please advise me what to do with an Oleander that is becoming infested with flat, brown bugs. They do not seem to crawl but are spreading rapidly. It is also covered with a sticky stuff that seems to come out of the leaves. What shall I do for this as it is hard to wash off?

The sticky substance is the result of the presence of the insects, which can be removed by washing the plant with kerosene emulsion made by thoroughly mixing one pint of kerosene oil with one-half pint of sour milk, stirred thoroughly until a butter is formed. Of this take one part to fifteen parts of water, stir frequently and apply with a cloth or sponge. Two applications will usually free a plant of these pests and it will also remove all foreign matter from the foliage, leaving the plant clean and healthy. You had better put a cloth over the soil while working about the foliage as it is not desirable to get too much oil in the earth.

Mrs. H. P. P., Chicago, Ill., U. S. A. sent foliage of two plants for identification. The broad leaves are from the Arcila and the other foliage is from the Grevilla Robusta or Silk Oak.

If any flower lover wishes to be successful with the Scarlet Salvia, in the vicinity of St. John, it is necessary that the young plants should be started at once. Top cuttings should be taken and rooted as you would Geraniums. They should not be bedded until all danger of cold nights is past and should be well treated in respect to watering, etc. If treated otherwise they will not bud until the middle of September.

Wall flower cuttings should also be taken at once to insure blooming plants for the late summer.

Dutch Hyacinth bulbs are starting strongly now and must be carefully watched not allowing to grow in the dark after the sprouts are over two inches high. Direct sunlight should not be given at first, but after that give all sunshine possible and plenty of water.

The warm house has started everything growing so that bulbs and roots that have been cellared should be carefully looked after so that they do not become too dry. Cellar roses must be watched and if they start to grow should be brought to light else the first crop of foliage and bloom will be lost.

I have been asked a number of times about the new Nicotiana Sanderai, which was so extensively featured in this and last seasons' catalogues. I tried it thoroughly under different conditions but was much disappointed in it as a house plant. It may be, however, a better bedding plant but would prefer the older Affinis as a house plant.

Newfoundlanders Will Attend the N. S. A. C. Short Courses

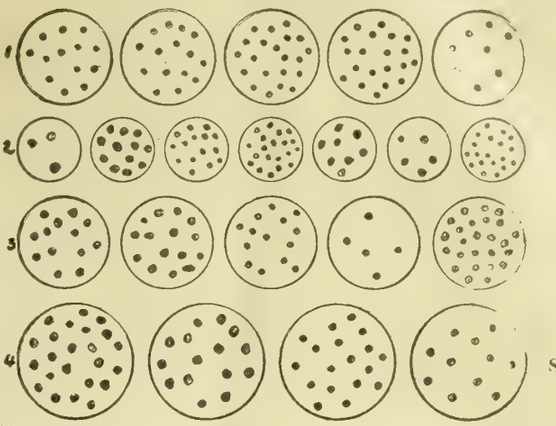
The Executive members of the St. John's Agricultural Society and Mr. Henry J. W. Bishop, Petty Harbor, Newfoundland purpose attending the Short Courses at the N. S. A. C., Truro, N. S.

They will be well rewarded for the time and money thus spent and the benefits that will come directly and indirectly to the Island Colony through the agricultural teachings at the College as gleaned and put in practice by these gentlemen can never be measured in terms of dollars and cents.

FREE $300.00 IN PRIZES

IN THE GREAT DOT PUZZLE CONTEST
A Genuine Contest for WISE HEADS!

SOLVE THIS PUZZLE



1 Something we all have
2 Something we all wear
3 Something we all like to have
4 Something we all do

The above 4 lines of circles containing dots represent the name of 4 different things described after each line. What are they?

HOW TO SOLVE THIS GREAT PUZZLE

Each circle of dots represents 1 letter of the word and the number of dots in each circle determine the letter in its relation to the alphabet. For instance: A is represented by 1 dot because it is the first letter in the alphabet, B is represented by 2 dots because it is the 2nd letter in the alphabet, C is represented by 3 dots because it is the 3rd letter in the alphabet. Now, with these simple instructions and a little patience you can soon have the puzzle solved. To give you a little assistance the 1st letter of the first word is M, because the circle contains 13 dots and M is the 13th letter of the alphabet.

After you have found the solution write your answer neatly on a piece of paper with your name and address and anything else you wish to say about the contest and send it in to us.

Those who send in the Correct or the Nearest Correct Answers; whose answers are the neatest and who live up to the condition of the contest (read rules of contest below), will win the following grand prizes:—

1st Prize, $125 00 in cash.
2nd " 50.00 "
3rd " 25.00 "
4th " 15.00 "
5th " Gent's Watch. Value $10.00.
6th " Ladies' Ring. Value $10.00.
7th " Fine Clock. Value $10.00.
8th " 44-Piece Dinner Set. Value $10.00.
9th Prize. Mission Upholstered Rocker Value $10.00.
10th Prize, Violin. Value $10.00.
11th Prize, Gillette Safety Razor. Value $5.00.
12th Prize, Waterman Fountain Pen: Value $5.00.
13th Prize, Glass Water Set. Value $5.00.
14th Prize, Large French Doll. Value $5 00.
15th Prize, Silverware Set. Value $5.00.

READ THE SIMPLE RULES OF THIS CONTEST

1. Contestants may send in as many answers as they wish, but only one answer can win a prize. (2) Only 1 person in each family will be allowed to compete. (3) No employees of ours or any relation of any employee will be allowed to compete. (4) Children under 12 years of age will not be permitted to compete. (5) Write only on one side of the paper. (6) All letters must be fully prepaid in postage. We will not accept answers upon which we will have to pay postage. (7) The decision of the judges must be accepted as final. The judging will be in the hands of 3 gentlemen of integrity who are absolutely disinterested. (8) This contest is absolutely free. You are not asked to spend one cent of your money or buy anything to enter. As soon as we receive your answer we will immediately tell you if you are right, and how the prizes will be distributed. We guarantee the awarding of the prizes described above according to decision of the judges.

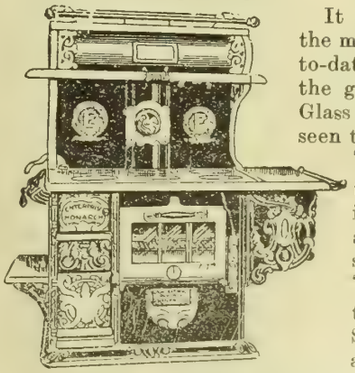
Address all answers to **Contest Department. Q-28**

NEW LIFE REMEDY COMPANY, TORONTO, ONT.

CANADA'S FINEST STEEL RANGE

"THE ENTERPRISE MONARCH"--For Wood or Coal

The acknowledged superior of anything yet made in this line



It has an established reputation as the most thoroughly constructed and up-to-date steel range on the market, with the greatest of all improvements—the Glass Oven Door, through which can be seen the contents of the oven.

We experimented with this feature for a long time and now have it right. No more waste of time and heat—the "Daylight Oven" solves the problem.

Note also the striking design of the Monarch, its convenient End Shelves, Full Length Towel Rod and other unique features.

As to its good baking qualities, ease of operation and economy in fuel, consult the neighbor who has one, or write direct for list of references and particulars.

The ENTERPRISE FOUNDRY CO., Sackville, N. B.

When Writing Advertisers Please Mention the Maritime Farmer.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Central Clarence, N. S.

The Clydesdale at Home.

(Continued from page 212)

last year were Baron of Buchlyvie, Baron's Pride, Everlasting, Hiawatha, Revelanta, Apukwa, Royal Favorite and Oyama. Celebrities spring from comparatively humble stock; that is, the winners do not produce all the winners by any means. Nevertheless, there are broodlines, established by generations of masterful intelligence, which give a high percentage of the foremost sires and show stock. Once a strain of breeding achieves widespread popularity it is given opportunity to perpetuate itself. So-called families are thus founded. In some instances this leads to the worshipping of dead equine ancestors and the overlooking of mediocrity in their living posterity. Among conservative people there is a deep sentiment back of such exclamations as "Long live the King!" Long live anything that once secures a foothold in Scotland.

What the breed means to scottish farmers it could mean to American farmers in many regions. But before it can make rapid progress on this side the public must have a clearer conception than it appears to have of fundamental draft-horse values. It must have a keener appreciation of the sterling stuff of which the Clydesdale in his best estate is made. It must attach more importance to the soundness and quality that characterize Clydesdale underpinning. America has a broad footing for this breed, but it is doubtful whether a country so Scotchless as ours in racial character has the type of horse-sense that is required to give the Clydesdale his due.

Which reminds us of a story: Jamie finding a horse-shoe pretended not to know what it was, and meeting a minister, whom he knew, asked for enlightenment. "Why, Jamie," said the clergyman "anybody that was not a fool would know that it is a horseshoe." "Ah!" said Jamie, "what it is to be wise—to ken it's no meer's shoe." And this story compels another: A Highlander observed standing at a hotel door a big man in full tartans, and noticed that his nostrils in an upturned nose gave that organ the appearance of the end of a 12-gauge double-barreled shotgun. He accosted the man and with magnificent politeness offered his mull for a pinch of snuff. Said the long, lanky stranger: "I never take snuff." "Oh", said the Highlander, "that's a peety, for there's grand accomodation.—D. C. W. in Exchange.

The Meeting of the Maritime Poultry and Pet Stock Association.

The annual meeting of the Maritime Poultry and Pet Stock Association was held in the Board Rooms of the Winter Fair Building at 10.30 A. M. on Wednesday, December 4th. The officers and about twenty-five members were present.

The minutes of the last meeting were read and approved. The President, Mr. L. H. D. Foster, of Marshfield, P. E. I. called on the vice-president for reports of the work in the different provinces.

Mr. Seth Jones, vice-president for N. B. spoke of the improvement in New Brunswick and outlined the work which is to be undertaken in the province to advance the industry. He called the attention of the members to the large importations of poultry and eggs and suggested that the members should get a share of this trade.

Mr. L. A. Haszard, vice-president for P. E. I. congratulated the Association on the great improvement which was shown in the dressed poultry classes. The market was always ready to receive poultry of the quality shown at a good profit to the producer but the poultry of poor quality was never in demand.

Mr. W. H. Henry, vice-president for Nova Scotia spoke briefly of the increase in the number of birds shown and also the superior quality in comparison with the early years of the show.

J. P. Landry reported for the prize list committee and pointed out the increase which had been given to the poultry prizes. The prize list had been improved upon and was now as good if not better than that offered by any other exhibition in the Maritime Provinces. The list would, however, require some changes and he called on all the exhibitors to write the prize list committee in order that they may make the list better than ever.

Mr. Seth Jones reported to the members that he had secured a oew entry ticket which would likely fill the requirements of the members. It was moved by Mr. I. C. Craig and seconded by Mr. L. A. Haszard that the entry ticket exhibited by Mr. Jones be used in future.

The motion was carried.

Mr. J. B. Dagget reported that he was unable any longer, on account of his new position, to act as a committee of the Association but advised the members to stand together and he informed them that his sympathy was with them in their work. An unanimous vote of thanks was tendered Mr. Dagget for his assistance to the poultrymen.

The financial report was read and showed a balance on the right side of the account of $129.51. This does not include the amount of this years subscriptions but when they are in, the amount to the credit of the association will be somewhat more.

The report was adopted.

Mr. J. Fred Watson, judge in the open classes, was called on and spoke of the quality of the exhibits.

W. A. Brown, judge of the dressed poultry classes spoke of the quality of the exhibits and recommended that increase of prizes be given in the dressed poultry classes.

He advised that more time be given up to lectures at the show than was allotted for this work this year. It was also pointed out by the speaker that many more could be interested in the work by holding the meetings oftener.

The Department of Agriculture were always ready to assist the work and advised the members to take advantage of their offer.

Mr. George Robertson complimented the members on the improvement in the classes he judged. The quality was good and would win in any show. He called attention to the fact that some very good poultry was shown which had not received proper care and attention. He would urge members to wash birds and prepare them by having them accustomed to the coops before coming to the show. It often spoiled a good bird to have it in a small coop when it was accustomed to freedom.

Mr. T. A. Benson, the newly appointed superintendent of poultry in Prince Edward Island spoke of cooperation in poultry work to get the best results.

He advised the members to co-operate in their work and they would get better results.

Mr. Percie Johnson, St. John's, Newfoundland spoke of his pleasure at being an attendant at the Winter Fair and in particular the Poultry show. Out of his first visit to the fair much good had resulted to the poultry show had recently been held poultrymen of his Colony. The first in St. John's and was a great success. He stated that the people of Newfoundland had paid annually $11-000 for eggs to Prince Edward Island. They had also paid about $22,000 to the United States for dead poultry and it was his opinion that this money could be kept at home if the people would take an interest in the poultry industry.

Moved by Mr. Jones and seconded by Mr. Haszard that the secretary be a committee to arrange for an hour on the programme for a poultry lecture. The motion was carried.

The following were elected officers for the year;—

President, Mr. Seth Jones, Sussex, N. B.

Vice- president for N. S., C. J. Cook New Annan, N. S.

Vice-president for N. B., D. G. Stewart, Dalhousie, N. B.

Vice-president for P. E. I., Mr. L. H. D. Foster, Marshfield, P. E. I.

Director for N. S., Mr. J. A. Simpson, Amherst, N. S.

Director for N. B., P. P. Gunn, Sussex, N. B.

Director for P. E. I., Mr. L. A. Haszard, Charlottetown, P. E. I.

Prize List Committee; J. P. Landry Seth Jones and L. H. D. Foster.

J. A. Simpson, P. P. Gunn, and L. A. Haszard were appointed a committee to obtain more premiums for the prize list.

NORTHERN GROWN TREES

Suffered With A Lame Back

COULD NOT STRAIGHTEN UP.

Many people fail to understand the significance of a lame, weak, sore or aching back.

When the back aches or becomes weak it is a warning that the kidneys are affected in some way.

Heed the warning, cure the back and dispose of any chances of serious kidney trouble following.

Mr. C. Grace, Hamilton, Ont., writes: —"I was suffering with a lame back, and for two weeks was not able to straighten up to walk, and hardly able to sit down for the pains in my back, hips, and legs. I had used different kinds of pills, plasters, liniments and medicines, without any relief. One day I read about Doan's Kidney Pills and decided to try them. Before I had half a box used I felt a great deal better, and by the time I had used two boxes, I was cured. I have no hesitation in recommending Doan's Kidney Pills."

Price, 50 cents per box or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering specify "Doan's."

Before After

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous **Free Trial Treatment** of my well-known, reliable **Chronicure**, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. **Chronicure** succeeds where all else fails. **Chronicure cleanses the blood** and **removes the cause.** Also for a weakened, run-down condition of the system, you will find **Chronicure** a most satisfactory **general tonic** that makes you feel that life is worth living. Please tell your friends of this liberal offer, and **send today** for large free package, to **MRS. M. SUMMERS, Box E.** 30t —**Windsor, Ont.**

COMFORT IN THE RURAL HOME

The installation of a GOOD HEALTH CHEMICAL CLOSET in your home means health-convenience-comfort for the whole family. Not a luxury but a necessity. A postal will bring you full particulars. Address

THE NATIONAL MFG. CO., Limited. MONCTON, N. B.

To Tell the Age of a Horse.

There are things which we may reason out, and others which to be remembered must be in a sense memorized. One of the latter is the method of telling the age of a horse. Most of our memories work best to rhyme and the Aberdeen Free Press has used the rhyming method of telling the age of a horse. Here it is:

To tell the age of any horse
Inspect the lower jaw, of course.
The six front teeth the truth will tell
And every doubt and fear dispel.

Two middle "nippers" you behold
Before the colt is two weeks old,
Before eight weeks two more will come,
Eight months, the "corners" cut the the gum.

Two outside grooves will disappear
From the middle two in just one year
In two years from the second pair.
In three the "corners," too, are bare.

At two the middle "nippers" drop,
At three the second pair can't stop,
When four years old the third pair goes,
At five a full new set he shows.

The deep black spots will pass from view,
At six years from the middle two,
The second pair at seven years,
At eight the spot each "corner" clears.

From middle "nippers" upper jaw,
At nine the black spots will withdraw;
The second pair at ten are white,
Eleven finds the "corners" light.

As time goes on the horsemen know
The oval teeth three-sided grow;
They larger get, project before,
Till twenty, when we know no more.

Value of a Brood Mare.

The value of a brood mare is probably as indefinite a quantity as that most invariable of all quantities, the length of a piece of string. So much depends upon the mare herself, her type, breeding ability, motherliness, individuality.

More, perhaps, depends upon the owner of the mare, his efficiency as a manager and caretaker, both of mare and of foal, his judgment in the selection of a suitable stallion with which to mate the mare, in the development of foal and the selection of feeds. Due to the many factors which may influence it, therefore, the value of a broad mare becomes a most uncertain, a most variable quantity.

There is, I know, a brood mare that has demonstrated her worth to the owner. She is a seven-eights grade Percheron, of good type and quality, weighing about 1775 pounds. Rearing a colt every year, with one exception, during the past six years has not taken from her that snap, vigor and energy which undoubtedly has contributed largely to her breeding efficiency. It has developed in her that roominess of middle and hindquarters and that motherly appearance which associates itself inseparably with what we call the brood mare type.

"What is he worth to you," I asked the owner. "She and one of her three-year-old sons make me one of the best teams every year," he replied, "and I sell the colts the wintes before they are four years old. I have never taken less than $250 for one of her colts at that age. This fellow has been worked with her this summer, and he can see for yourself what he will be worth next winter when I get a little bloom on him Took them off a gravel wagon to show here. Two-months feed will put him up to 1850 pounds if the buyers will let me feed him that long."

The Reliable Remedy for Childrens' Colds

You cannot be too careful what cough medicine you give the children, for some of the remedies offered are anything but reliable.

NA-DRU-CO

Syrup of Linseed, Licorice and Chlorodyne

is reliable, for it contains absolutely nothing harmful to even the children.

But don't take our word for it—ask your druggist or physician. To these men, in whom you justly place implicit confidence, we will gladly send on request a complete list of the ingredients in this or any other Na-Dru-Co preparation.

Keep a 25c. or 50c. bottle of this reliable remedy always on hand, and it will nip in the bud all your trouble with coughs and colds.

DRAFTER OR DRIVER

I wish that in some way the value of a brood mare might be brought to the heart of a young man, any one of the number of young men who each year out of their first wages purchase their first piece of horse flesh. How many invest all the savings of the first year or two of work in some little squirt of a driving gelding whose only function is to drag a rubber-tired buggy about during the time that the owner had better be sleeping a bit, getting a little refreshment for the next day's work? How few appreciate the fact that with a little application of business to this first investment they might put their money into a good brood mare which each year thereafter would add materially to their annual income.

The young man working for $25 a month besides all the other things, including "horse kept," which make the wages of the hired man on the farm go so much farther than a double wage in town, should be able to make a wise arrangement with his employer whereby the "horse kept" part of the agreement might hold whether the horse be of the common or buggy variety or whether it be of a good draft type.

He can then buy the sort of mare which can be used with the regular farm teams part of the time, and raise a colt each year. A well-bred draft colt can generally be turned at weaning time at something upwards of $100. This amount added to the income of the average hired man would go a considerable ways toward hastening the time when he should become a farmer and a hirer of men.

There may not be quite as much of the dash and display that counts for something with the young people of a certain type in this proposition, but with the older men, with the fellows who have been through the mill and have learned from that expensive teacher, experiense, there is no question as to the wise choice.

The young man starting out in farm life for himself, either as a hired man or as a young farmer, should consider well the value of a good brood mare. If he must own a horse, let him select one that will earn for him some of the easiest money he will ever make.—Horseman, Pictou, N. S.

Fitting Horses for Sale.

With the season's work over, many farm horses will be placed upon the market and we will have buyers, shippers, feeders and farmers mating or matching up teams, and traders and junkers scouring farm territory in quest of horses. If you have a horse to sell it will be time well spent to put him in condition. You want the best price, of course, and the animal put into condition will bring it. The shipper wants them well fitted.

If it pays the feeder to buy and feed up, it will pay you to feed and slick up the animal. Make his coat glossy. This is not all done with the brush and curry comb, but largely with good feeding and care. Brush out his tail and mane, trim his foretop and fetlocks neatly and look to his feet that he stands erect.

A new web halter adds much to the appearance of the animal when being shown in the outside yard. If you train him to be shown off once or twice each day you'll be surprised what two or three weeks' work will accomplish. Get acquainted with his manner and gait, and when the buyer comes you will be surprised at the results. When you come to make the deal you can make your own price. That is where the farmer gets his profit, and it is worth while.

7 Reasons Why

You want to know why we think your choice of a gasoline engine should be the Renfrew Standard. **FIRST**—Because it is the latest type of gasoline engine offered for sale in Canada. **SECOND**—Because the

Renfrew-Standard

starts without cranking, thus eliminating the only dangerous, laborious and exasperating feature of gasoline engines. **THIRD**—Because the Renfrew-Standard is so perfectly balanced it does not require to be anchored or fastened down. **FOURTH**—Because the Carburetor is of simple construction and proper proportion to make a perfect mixture. **FIFTH**—Because the engine can be closely regulated. **SIXTH**—Because it is conomical on gasoline. **SEVENTH**—Because it is guaranteed for 5 years, by the same company who build and stand behind the famous "Standard" cream separator. Many other points of superiority fully covered in our Gasoline Engine Bulletin. Write for a copy.

The Team at the Hitching Bar.

Say, Brother Farmer, what sort of a team do you tie to the hitching bar?

Don't you know that the character of the farmer is reflected in his horses?

"Show me the farmer's team and I can tell you the conditions of his farm," a wise old neighbor told the writer not long ago, when the two of us were looking over the assortments of rigs at the town hitching bar.

"See those spanking fine bays, with the cleanly-polished harness, the padded collars, and the newly-painted wagon over there," this old neighbor went on. "Well, I'll guarantee the owner of that team is a thrifty farmer—fences in good repair, gates swinging free, crops well cultivated, cows sleek and fat. Then look at those others—the grays, good enough horses all right, and they show ample feeding; but they hav?n't been curried and brushed enough to bring out the shine. And see the harness—rusty and unpolished, collars ill-fitting, tugs patched, and hold-backs broken; look at the wagon—hasn't seen any paint since it left the factory. Bolts and nuts missing the seat mended with baling wire. Now I'll warrant that the owner of that team is not a thrifty farmer—he's careless and indifferent. He may have a good farm, but is not getting out of it one-half or one-third what it should produce."

As I drove home the words of that kind old neighbor kept revolving in my mind. Every little while I passed a familiar team—Jed Munyun's blacks, dashing along with a glistening surrey rolling at their heels, and Jed leaning over the dashboard, fairly tugging at the lines. I know that there are but few farm-houses and few barns in all the township bigger and better than Jed's and yet Jed was a poor man only a few years ago, struggling hard to make his way and keep his credit clear. Then I passed Bob Johnson's roans, their heads down, their ears flopping, bobbing along slowly, the lines sagging to the tongue, traces clanking, and Bob half asleep on the dilapidated seat of a creaking buckboard: I also know the condition of things on Bob's farm—an unpainted house, sag-roofed barn, broken-down fences and weed-choked fields.

Other teams I passed on the road home, each telling its story of thrift or laziness, care or neglect. It was as if all the farms of the community, with their houses, their barns, their lots and fields, passed me in review. And I was more firmly convinced than ever that my wise neighbor spoke the truth—the character of the farmer is reflected in his horses So you and I, my brother, might look well to the sort of team we tie to the hitching bar.—Dennis H. Stovall.

Some Nova Scotia Holsteins.

When visiting his home at Truro, N. S., recently, an editor of Farm and Dairy made a brief visit to the farm of Samuel Dickie, Central Onslow, N. S., one of the leading Maritime Holstein breeders. Mr. Dickie's herd is not seen as frequently in the show ring as it used to be. He is going in extensively for Records of Performance test work, believing that purchasers of dairy cattle demand producing ability rather than show yard excellence, although conformation is not lost sight of. At present Mr. Dickie is preparing to enter several animals in the dairy test at Amherst, where he has made many notable successes, having won 75 per cent of the championships during the last three years.

The bull at the head of this herd is Royalton Canary Major, bred by W. H. Standish, of Ohio. The dam of this bull has a record of 34.6 lbs.

WILL GIVE $500 TO SICK READERS OF MARITIME FARMER

Famous Scientist Who Originated the Now Wonderful "Home Treatment" Offers $1.00 Package Free to Sick and Ailing.

In order that every reader of Maritime Farmer who may not have heard of this wonderful "Home Treatment" may have an opportunity to test this celebrated medicine, the now famous scientist, Dr. James W. Kidd, offers to give absolutely free a full size $1.00 package to five hundred readers of this paper, to prove the wonderful claims which have been made for it. In making this offer the scientist said: "I know that there are many people who have been suffering for years with some chronic disease and many of them have spent large sums of money seeking a cure. I know that these people hesitate about investing money in medicine because they have despaired of ever getting well. Thousands have told me that story and many thousands of the same people have told me afterwards that my treatment had cured them after doctors and everything else had failed. I want to prove to a limited number—no matter what the disease, no matter how long they may have suffered no matter how blue and discouraged—that my treatment really and actually does accomplish the wonderful results that have been reported."

People who suffer from Rheumatism, Kidney Trouble, Stomach Trouble, Liver or Bowel Disorders, Catarrh, Bronchitis, Asthma, Chronic Coughs, Weak Lungs, Lumbago, Piles, Urinary Disorders, Female Weaknesses of any kind, the weak, worn out, broken-down and despondent will be delighted at the effect of a few doses. This wonderful treatment creates a fine appetite and helps the digestive organs to carry on their functions as they should. It strengthens the kidneys, too, and drives rheumatism poisons from the blood as if by magic. That is why people who try it become so enthusiastic.

Any reader of Maritime Farmer who will try this extraordinary medicine that has created so much excitement by its cures can obtain absolutely free a full $1.00 treatment by simply filling in the coupon below or writing a letter describing their case in their own words, if they prefer, and mailing it today to James W. Kidd, Toronto, Canada. No money need be sent and no charge of any kind will be made.

As this offer is limited, you should write at once, in order to be sure to receive your free treatment.

Coupon CB-260 For Free Dollar Treatment

THOUSANDS OF PEOPLE SUFFER UNTOLD AGONY FROM

Dyspepsia.

It is one of the most prevalent troubles of civilized life, and the poor dyspeptic cannot even enjoy a meal without distressing after effects, for nearly everything that enters a weak dyspeptic stomach acts as an irritant. Burdock Blood Bitters will regulate the stomach, stimulate secretion of the saliva, and gastric juice to facilitate digestion, remove acidity, and tone up the entire system.

Mrs. Dennis Hebert, St. Boniface, Man., writes:—"I have used Burdock Blood Bitters, with great success, for dyspepsia, indigestion and sour stomach. I was terribly troubled with my stomach for months, and spent a lot of money without getting any relief, until I happened to see about a woman using it, and her trouble seemed the same as mine. I tried one bottle, and was so much relieved, I bought five more, and have taken them, and I now can eat anything I wish."

of butter in seven days and an average test of 4.4. She made 17,500 lbs. of milk in nine months. As an individual the bull is a big, strong fellow, showing lots of constitition and vigor, with as desirable a head as one would wish to see on a Holstein bull.

Another bull that attracted out attention was Helbon De Kol's Prince, the only son of Helbon De Kol. His dam made 31.54 lbs. of butter and 558.30 lbs. of milk, with an average test of 4.5 in seven days and 128.57 lbs. of butter in 30 days. She started her 30-day test 30 days after calving In Record of Performance she made 16,346 lbs. of milk as a three-year-old. This is the largest record yet made by a three-year-old in Canada. A full sister of Prince made an R. O. P. test of 14,889.5 lbs. and 658.96 lbs. of butter at three years and one month old, the second highest record for a three-year-old in Canada. Helbon De Kol's Prince is sired by Lord Roberts De Kol, among whose daughters is numbered National Queen De Kol, winner at Guelph last fall. In the stables we saw many calves sired by Helbon De Kol's Prince, and they were good ones. He is a sure stock getter, tuberculin tested and 75 per cent of his calves are heifers.

Mr. Dickie's females did not show to advantage as most of them were dry or far advanced in lactation. The milk from this herd is shipped to the condensory and as prices are considerably higher in winter than in summer most of the cows are bred to freshen in the fall. A cow that attracted our attention was Nellie Mercedes Beauty, giving at present 65 lbs. of milk a day. Another was Blanche La Honda, giving 50 lbs. of milk a day, freshening last March. All of the cows were of the heavy bodied, low down, deep milking kind. The average test of the herd runs from 3.6 to 3.8.—Farm and Dairy.

OUR VALUES

are summed up briefly under the following captions:

Style and Quality

Our goods are made to suit you no matter what your occupation may be or what they are needed for.

The Robert Taylor Co., Limited

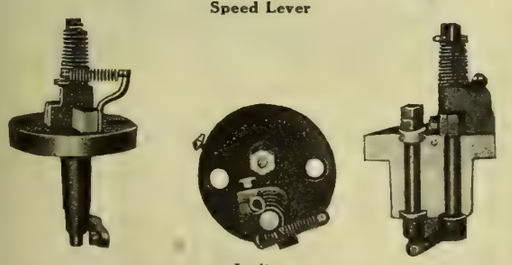
HALIFAX, N. S.

STRONG POINTS OF THE WATERLOO BOY

In the Christmas Number of this paper we mentioned a few of the advantages of handling our engine. We are now going to tell you a few of our engines strong points.

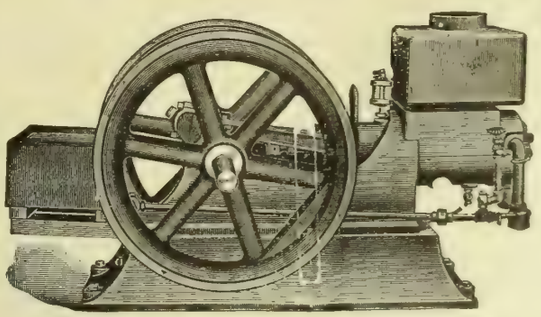
Its speed lever works like the throttle of the locomotive and varies the speed ***while running*** from fifty to seventy-five resolutions per minute. The old reliable fly-ball governor keeps the speed absolutely steady, no matter how much the load varies and the automatic fuel regulator uses fuel ***only*** when needed for power, ***making it the cheapest engine to run.*** We have an improved patent mixer that does away with the expense and bother of a pump and, our new patent igniter is as simple and positive as a pair of scissors.

Speed Lever



Igniter

The Waterloo Boy is the simplest engine made—has the fewest parts, least chance to get out of order, easiest to manage, and is the nearest automatic in action and "fool proof" in construction, frost proof and starts easiest in coldest weather—no bucking or stalling. All working parts interchangeable—made by skilled workmen in a factory with a capacity of 140 engines complete a day—in the biggest and best equipped factory in the world devoted exclusively to gasoline engines. Every part is exact in size and finish, made of the best material and heavier and stronger than will ever be required.



This great engine is advertised in the leading farm papers ***everywhere*** Right now we are telling your customers about its advantages and about its recent great International victory. They are going to want the Waterloo Boy and we are going to bring them RIGHT INTO YOUR PLACE OF BUSINESS, TO GET IT—enthusiastic prosperous ***men with the money to buy.*** We will back you up squarely, fight with you against every rival—we absolutely guarantee the Waterloo Boy, not only to you but ***to your customer, too.***

Here's a big line— a size for every need. Let's get together—***Are you with us?*** Then write for our proposition today—tomorrow your competitor may be in the band wagon and ***the man with the Waterloo Boy is the one that WILL GET THE BUSINESS.***

Remember we have a winning offer ready for you, so fill out the coupon or pin it to your letterhead and mail to-day.

If you are troubled with chronic constipation, the mild and gentle effect of Chamberlainjs Tablets makes them especially suited to your case. For sale by all dealers.

This is Not a Fish Story.

Editor The Maritime Farmer:—

I bought two young pigs on the 8th day of May, 1912, from Mr. John Camber, Spring Hill, York Co., N. B. They were just then three weeks old the day I got them. When they were seven months and twelve days old, I killed them on November 29th and they tipped the scales at 295 and 305 lbs. making just even 600 lbs. for tbe two.

Mr. Cecel Henry, a neighbor of mine, killed one six days under 8 months old that tipped the scales at 320 lbs.; it was sired by the same boar as mine, but out of a different sow. These pigs were grade Yorkshires being sired by a pure bred Yorkshire boar.

Now Mr. Editor, do you know of any pigs to beat these, ages considered? If so I would like to hear about them through your valuable paper for we think, around here, if we can get a spring pig to dress 200 lbs. in the fall we have a good one.

Harry Alliston,
Fredericton, N. B.
Herdsman at Brooklands Stock Farm.

Our Best Friends.

Birds which live so largely on noxious insects, protect our crops from great loss and destruction. We are not giving the birds the protection which the best interests of mankind demands. They are being watonly killed and some species are now extinct. The food value of certain species is important, but really nothing in comparison with their live value to catch insects.

Three bills are before U. S. congress to protect migratory birds and it is important that one of them be speedily enacted. The birds that go South for the winter should be allowed to return unmolested to their northern resting places. The only way such protection can be assured is through a stringent federal law. For this reason every one interested in bird life should urge congressmen and senators to pass at this session a federal migratory bird law. Now is the time to lick a stamp for the birds.—Ex.

Getting Eggs in Winter.

Keep the hens busy if you would get winter eggs. The hen that eats her fill and goes back on the roost will not lay many eggs during the winter. The science of feeding has been worked out by many of the experiment stations and colleges, but nowhere better than at Cornell university. Prof. Chas. A. Rogers, in an address to connecticut poultrymen, explained their method of feeding which has given some wonderfully good records.

In the morning the hens are led 2½ to 3 pounds mixed grains for 100 Leghorns. At noon green feed or green cut bone is given and the hoppers of dry mash are opened. At night they are fed seven to eight pounds of mixed grain. Grit and oyster shell are kept before them at all times. By giving a light feed of grain in the morning in deep litter the hens are kept hungry and will scratch all day for it. They should eat from one-third to one-half as much dry mash as hard grain.

Agriculture is a great science, but science does not mean a complicated system of knowledge. Agriculture is simple, and agricultural science is simple. Science is only classified and arranged knowledge.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer
SUSSEX, N. B.

We do not sell these burners but each subscriber may get two beside one we furnish free by sending 35 cents for each additional one wanted.

Let's make a Jelly Roll—
With FIVE ROSES flour.

Its *Strength* and *Fineness* hold your batter together in the long well-greased pan.

Bakes *evenly.*

Smooth Texture—soft, golden Crumb, spongy, porous, yielding.

No holes, nor lumps to *vex* you.

And when you turn it out on the damp napkin hot and *savory*, and you spread the under side with "jell"—

It doesn't get *soggy* nor crumbly.
Roll it gently, carefully.
Not a *crack*—not a *break.*
Perfect Smoothness—a Perfect Roll *Yours.*
Bake anything, make anything.
Use FIVE ROSES—*bread and pastry.*
Melting puff paste—flaky pie crust—crinkly fritters—tooth some rolls.
FIVE ROSES for anything—*everything.*
Be flourwise.

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days

Price $2.00 Prepaid

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns. farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS:

General Construction Plans -Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete - Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.
